

Scarborough Seabed Intervention and Trunkline Installation Environment Plan

October 2023

Revision 6

THIS PAGE HAS BEEN INTENTIONALLY LEFT BLANK

TABLE OF CONTENTS

1	INTRODUCTION	18
1.1	Overview.....	18
1.2	Defining the Petroleum Activity	18
1.3	Purpose of the Environment Plan.....	18
1.4	Scope of the Environment Plan.....	19
1.5	Environment Plan Summary	19
1.6	Structure of the Environment Plan	19
1.7	Description of the Titleholder	22
1.8	Details of Titleholder, Liaison Person and Public Affairs Contact	22
1.8.1	Titleholder.....	22
1.8.2	Nominated Liaison Person.....	22
1.8.3	Arrangements for Notifying of Change	22
1.8.4	Woodside Management System	22
1.8.5	Environment and Biodiversity Policy	24
1.9	Description of Relevant Requirements.....	24
1.9.1	Offshore Petroleum and Greenhouse Gas Storage Act 2006.....	24
1.9.1.1	Offshore Project Proposal	25
1.9.2	Environmental Protection Act 1986.....	25
1.9.3	Sea Dumping Act.....	26
1.9.4	Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act).....	27
1.9.4.1	Recovery Plans and Threat Abatement Plans	27
1.9.4.2	Australian Marine Parks	27
1.9.4.3	World Heritage Areas	29
2	ENVIRONMENT PLAN PROCESS	30
2.1	Overview.....	30
2.2	Environmental Risk Management Methodology	30
2.2.1	Establish the Context.....	30
2.2.2	Review of the Significance/Sensitivity of Receptors and Levels of Protection	30
2.2.3	Environmental Legislation and Other Requirements	31
2.2.4	Impact and Risk Identification	31
2.3	Impact and Risk Analysis and Evaluation.....	31
2.3.1	Impact Evaluation	32
2.3.2	Risk Evaluation	32
2.3.3	Decision Support Framework.....	34
2.3.4	Demonstration of ALARP	35
2.3.5	Demonstration of acceptability	35
2.4	EPBC Act Assessment	37
2.4.1	Principles of ESD.....	37
2.4.2	MNES: Significant Impact Guidelines 1.1.....	37
2.4.3	Recovery Plan and Threat Abatement Plan Assessment.....	38
2.4.4	Australian Marine Parks.....	38

2.5	Environmental Performance Objectives/Outcomes, Standards and Measurement Criteria .	38
3	DESCRIPTION OF THE ACTIVITY	39
3.1	Overview	39
3.2	Project Overview	39
3.3	Concordance with the Scarborough OPP	40
3.4	Location	45
3.5	Operational Area	48
3.6	Timing	48
3.7	Vessel Operations	49
3.8	Support Operations	49
3.8.1	Refuelling	49
3.8.2	Helicopter Operations	50
3.8.3	ROV Operations	50
3.8.4	Underwater Acoustic Positioning	50
3.9	Seabed Intervention Activities	50
3.9.1	Surveys	50
3.9.2	Vessel Operations	51
3.9.2.1	Trailing suction hopper dredge (TSHD)	51
3.9.2.2	Rock Installation Vessel (RIV)	51
3.9.2.3	Offshore Construction Vessels (OCVs)	52
3.9.2.4	Support and other vessels	52
3.9.3	Trunkline Trenching (Dredging and Material Disposal)	53
3.9.4	Offshore Borrow Ground Dredging and Backfill	53
3.9.5	Continental Slope Crossing Seabed Preparation	54
3.9.6	Pipeline and Infrastructure Crossing Supports	54
3.9.6.1	Rock Berms	55
3.9.6.2	Concrete Mattresses	55
3.10	Span Rectification	57
3.10.1	Grout Bags	57
3.11	Trunkline Installation Activities	57
3.11.1	Surveys	57
3.11.2	Vessel Operations	58
3.11.2.1	Shallow Water Lay Barge	58
3.11.2.2	Pipelay Vessel	59
3.11.2.3	Pipe Supply Vessel or DP Bulk Carrier	59
3.11.2.4	Construction Vessel	59
3.11.2.5	Support and Other Vessels	60
3.11.3	Trunkline Installation	60
3.11.3.1	Buoyancy Removal	61
3.11.3.2	Pipe and Structure Delivery to the SWLB and PV	61
3.11.3.3	Laying in Trenches	61
3.11.3.4	Laying over Existing Infrastructure	61
3.11.3.5	Laying Down Continental Slope	61
3.11.3.6	In-line Tee, Hot Tap Tees, ancillary structures	61
3.11.4	PLET and foundations Installation	62

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

3.11.5	Trunkline Pre-commissioning.....	62
3.11.5.1	Dry Pre-commissioning (base case).....	62
3.11.5.2	Cleaning and Gauging Pigging.....	63
3.12	Non-production phase and IMMR.....	63
3.13	Contingent Activities.....	63
3.13.1	Flood, Clean, Gauge, Test and Dewater.....	63
3.13.2	Wet Buckle Response.....	63
3.13.3	Trunkline Abandonment and Retrieval.....	64
3.13.4	Retrieval of Lost Buoyancy Tanks.....	64
3.13.5	Temporary Mooring of Trunkline Installation Vessel.....	64
3.13.6	Wet Parking Equipment.....	64
3.13.7	Jetting and Mass Flow Excavation.....	64
3.13.8	Pre-lay Removal of Obstructions.....	64
3.13.9	Dead Man Anchor pipelay initiation.....	65
3.13.10	Maintenance of Trenches and Rock Berms.....	65
3.13.11	Deburial.....	65
3.13.12	Remediation Work.....	65
3.13.13	Hydrotest discharges for IMMR activities during non-production phase.....	65
4	DESCRIPTION OF THE EXISTING ENVIRONMENT.....	66
4.1	Overview.....	66
4.2	Regional Context.....	70
4.3	Matters of National Environmental Significance (EPBC ACT).....	70
4.4	Physical Environment.....	71
4.4.1	Climate and meteorology.....	71
4.4.2	Oceanography.....	71
4.4.3	Bathymetry, geomorphology and sedimentology.....	72
4.4.3.1	Trunkline Project Area.....	72
4.4.3.2	Offshore Borrow Ground Project Area.....	74
4.5	Habitats and Biological Communities.....	75
4.5.1	Primary Productivity.....	75
4.5.2	Benthic Habitats and Communities.....	75
4.5.3	Shoreline and Coastal Habitats.....	83
4.5.4	Marine Fauna.....	83
4.6	Protected Species.....	84
4.6.1	Fish, Sharks and Rays.....	85
4.6.2	Marine Reptiles.....	87
4.6.3	Marine Mammals.....	94
4.6.3.1	Pygmy Blue Whale.....	95
4.6.4	Seabirds and Migratory Shorebirds.....	100
4.6.5	Seasonal Sensitivities for Protected Species.....	106
4.7	Key Ecological Features (KEFs).....	107
4.8	Protected Places.....	109
4.9	Socio-economic Environment.....	112

4.9.1	Cultural Features and Heritage Values	112
4.9.1.1	Background	112
4.9.1.2	First Nations peoples.....	113
4.9.1.3	Coastally Adjacent First Nations Groups	114
4.9.1.4	Marine Parks	117
4.9.1.5	Sea Country Values	118
4.9.1.6	Summary of cultural features and heritage values	155
4.9.1.7	Historic Sites of Significance	166
4.9.1.8	Historic Underwater Heritage.....	166
4.9.1.9	World, National and Commonwealth Heritage Listed Places	166
4.9.2	Commercial Fisheries	168
4.9.3	Traditional Fisheries.....	177
4.9.4	Tourism and Recreation.....	177
4.9.5	Commercial Shipping.....	177
4.9.6	Oil and Gas.....	178
4.9.7	Defence	179
5	CONSULTATION	181
5.1	Summary	181
5.2	Consultation – General Context	182
5.3	Identification of Relevant Persons for Consultation	186
5.3.1	Regulations 11A(1)(a), (b) and (c).....	186
5.3.2	Regulation 11A(1)(d).....	186
5.3.3	Regulation 11A(1)(e).....	187
5.3.4	Persons or Organisations Woodside Chooses to Contact.....	187
5.4	Consultation Material and Timing.....	187
5.4.1	Sufficient Information	188
5.4.2	Reasonable Period for Consultation.....	190
5.4.3	Discharge of Regulation 11A	191
5.5	Context of Consultation Approach with First Nations.....	192
5.5.1	Approach to Methodology – Woodside’s Interpretation of Tipakalippa	192
5.5.2	Consultation Method.....	193
5.5.2.1	Identification of Relevant Persons	195
5.5.2.2	Opportunity to Self-identify and Identifying Other Individuals	195
5.5.2.3	Reasonable Period for Consultation	197
5.5.2.4	Discharge of Regulation 11A.....	197
5.6	Providing Feedback and Assessment of Merit of Objections or Claims	197
5.7	Ongoing Consultation	198
5.8	Woodside’s Methodology to Identify Relevant Persons.....	198
5.8.1	Identification of Relevant Persons Under Regulation11A(1)(a), (b) and (c)	198
5.8.2	Identification of Relevant Persons Under Regulation11A(1)(d))	199
5.8.3	Identification of Relevant Persons Under Regulation11A(1)e.....	205
5.8.4	Assessment of Relevant Persons for the Proposed Activity	205
5.9	Consultation Activities and Additional Engagement for the Scarborough Seabed Intervention and Trunkline Installation Environment Plan	242
5.9.1	Traditional Custodian Specific Consultation	245

6	ENVIRONMENTAL RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENT CRITERIA.....	247
6.1	Overview.....	247
6.2	Impact and Risk Analysis and Evaluation.....	247
6.2.1	Concurrent operations and cumulative impacts.....	247
6.3	Environmental Performance Outcomes, Standards and Measurement Criteria.....	251
6.4	Presentation	261
6.5	Potential Environment Risks Not Included Within the Scope of this Environment Plan..	263
6.5.1	Shallow/Near-shore Activities	263
6.5.2	Loss of Containment from Existing or Third Party Subsea Infrastructure.....	263
6.6	Indirect Impacts	264
6.7	Planned Activities (Routine and Non-Routine)	268
6.7.1	Physical Presence – Interactions with Other Marine Users	268
6.7.2	Physical Presence – Seabed Disturbance (trenching, spoil disposal, borrow ground dredging and Trunkline backfill)	274
6.7.3	Physical Presence – Seabed Disturbance (Intervention and Trunkline Installation)	293
6.7.4	Routine Light Emissions from Project Vessels	307
6.7.5	Routine Atmospheric Emissions and Greenhouse Gas Emissions.....	319
6.7.6	Routine Acoustic Emissions.....	326
6.7.7	Routine and Non-Routine Discharges – Vessels and Seabed Intervention	350
6.7.8	Routine and Non-Routine Discharges – Trunkline Installation and Pre-commissioning.	358
6.8	Unplanned Activities (Accidents, Incidents, Emergency Situations)	375
6.8.1	Quantitative Spill Risk Assessment Methodology.....	375
6.8.1.1	Worse Case Scenarios.....	375
6.8.1.2	Hydrocarbon Characteristics	376
6.8.1.3	Environment that May Be Affected and Hydrocarbon Contact Thresholds.....	377
6.8.1.4	Surface Hydrocarbon Threshold Concentrations	378
6.8.1.5	Accumulated Hydrocarbon Threshold Concentrations.....	378
6.8.1.6	Dissolved Aromatic Hydrocarbon Threshold Concentrations	379
6.8.1.7	Entrained Hydrocarbon Threshold Concentrations	379
6.8.1.8	Scientific Monitoring	379
6.8.2	Unplanned Hydrocarbon Release – Vessel Collision	380
6.8.3	Unplanned Hydrocarbon Release – Bunkering	402
6.8.4	Unplanned Discharge – Deck and Subsea Spills	409
6.8.5	Unplanned Discharge – Hazardous and Non-Hazardous Solid Waste / Equipment	414
6.8.6	Physical Presence (Unplanned) – Seabed Disturbance	420
6.8.7	Physical Presence (Unplanned) – Interaction with Marine Fauna	430
6.8.8	Physical Presence (Unplanned) – Accidental Introduction and Establishment of Invasive Marine Species	443
6.9	EPBC Act Assessment	450
6.9.1	Principles of ESD.....	450
6.9.2	MNES Significant Impact Guidelines.....	450
6.9.3	Recovery Plan and Threat Abatement Plan Assessment	450
6.9.4	Australian Marine Parks.....	461
6.10	Cultural Features and Heritage Values Assessment	465

7	IMPLEMENTATION STRATEGY	487
7.1	Overview.....	487
7.2	Systems, Practice and Procedures	487
7.2.1	Assessment of Project Fluids.....	487
7.2.2	Woodside IMS risk assessment process.....	489
7.2.2.1	Objective and scope.....	489
7.2.2.2	Risk assessment process.....	490
7.3	Woodside Decommissioning Framework	492
7.3.1	Decommissioning Planning.....	492
7.3.1.1	Scarborough Decommissioning Strategy.....	493
7.3.1.2	Scarborough Trunkline Decommissioning	493
7.4	Roles and Responsibilities	494
7.5	Heritage Management Committee Implementation	498
7.6	Thalanyji Sea Country Management Process	499
7.7	Unexpected Finds Procedure.....	501
7.8	Training and Competency	502
7.8.1	Overview.....	502
7.8.2	Inductions	502
7.8.3	Activities Program Specific Environmental Awareness.....	503
7.8.4	Marine Fauna Observation Training.....	503
7.8.5	Management of Training Requirements	506
7.9	Monitoring.....	506
7.9.1	Source-based Impacts and Risks	506
7.9.2	Management of Knowledge	506
7.10	Tiered Monitoring and Management Framework.....	507
7.10.1	Tiered trigger levels and process	507
7.10.1.1	Project attributability assessment	508
7.10.1.2	Adaptive management actions	508
7.10.2	Water quality monitoring	511
7.10.3	Coral community assessment	514
7.10.4	Dredge plume assessment study.....	515
7.11	Management of Marine Fauna	516
7.12	Auditing.....	518
7.12.1	Subsea Installation Activities.....	518
7.12.2	Marine Assurance.....	518
7.12.3	Risk Assessment	519
7.13	Management of Non-conformance.....	520
7.14	Review.....	521
7.14.1	Management Review	521
7.14.2	Learning and Knowledge Sharing	521
7.14.3	Review of Impacts, Risks and Controls Across the Life of the EP	521
7.15	Management of Change and Revision	521
7.15.1	EP Management of Change.....	521
7.15.2	OPEP Management of Change.....	522

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.16	Record Keeping	522
7.17	Reporting	522
7.17.1	Routine Reporting (Internal)	523
7.17.1.1	Daily Progress Reports and Meetings	523
7.17.1.2	Regular HSE Meetings	523
7.17.1.3	Performance Reporting	523
7.17.2	Routine Reporting (External)	523
7.17.2.1	Ongoing Consultation	523
7.17.2.2	Start and End Notifications of the Petroleum Activities Program	525
7.17.2.3	Environmental Performance Review and Reporting	526
7.17.2.4	End of the Environmental Plan	526
7.17.3	Incident Reporting (Internal)	526
7.17.4	Incident Reporting (External) – Reportable and Recordable	526
7.17.4.1	Reportable Incidents	526
7.17.4.2	Recordable Incidents	527
7.18	Other External Incident Reporting Requirements	527
7.19	Emergency Preparedness and Response	531
7.19.1	Overview	531
7.19.2	Emergency Response Training	532
7.19.3	Emergency Response Preparation	533
7.19.4	Oil and Other Hazardous Materials Spill	533
7.19.5	Emergency and Spills Response	534
7.19.5.1	Level 1	534
7.19.5.2	Level 2	534
7.19.5.3	Level 3	534
7.19.6	Emergency and Spill Response Drills and Exercises	534
7.19.7	Hydrocarbon Spill Response Testing of Arrangements	535
7.19.7.1	Testing of Arrangements Schedule	536
7.19.7.2	Exercises, Objectives, and KPIs	538
7.19.7.3	Cyclone and Dangerous Weather Preparation	538
8	REFERENCES	540
9	GLOSSARY AND ABBREVIATIONS	557
9.1	Glossary	557
9.2	Abbreviations	560
APPENDIX A	WOODSIDE POLICIES	566
APPENDIX B	RELEVANT REQUIREMENTS	569
APPENDIX C	EPBC ACT PROTECTED MATTERS SEARCH	572
APPENDIX D	OIL SPILL PREPAREDNESS AND RESPONSE STRATEGY SELECTION AND EVALUATION	573
APPENDIX E	NOPSEMA REPORTING FORMS	574
APPENDIX F	STAKEHOLDER CONSULTATION	575
APPENDIX G	DEPARTMENT OF ABORIGINAL AFFAIRS HERITAGE SEARCH RESULTS	576

APPENDIX H	MASTER EXISTING ENVIRONMENT	577
APPENDIX I	SCARBOROUGH DEVELOPMENT DREDGED SEDIMENT DISPERSION MODELLING REPORT	578
APPENDIX J	OIL POLLUTION FIRST STRIKE PLAN.....	579
APPENDIX K	JASCO MODELLING SUMMARY	580
APPENDIX L	PROGRAM OF ONGOING ENGAGEMENT WITH TRADITIONAL CUSTODIANS	582

LIST OF TABLES

Table 1-1: EP Summary.....	19
Table 1-2: EP process phases, applicable regulations and relevant section of EP	20
Table 1-3: Activity relevant Condition 6 requirements	26
Table 1-4: Conditions of Class Approval relevant to the Petroleum Activities Program	28
Table 1-5: Relevant management principles under Schedule 5 – Australian World Heritage management principles of the EPBC Act	29
Table 2-1: Summary of Woodside’s criteria for ALARP demonstration.....	35
Table 2-2: Summary of Woodside’s criteria for Acceptability for Scarborough EP’s	36
Table 3-1: Petroleum Activities Program Overview	39
Table 3-2: Concordance of activities described in the Scarborough OPP with those included in this EP	42
Table 3-3: Approximate location details for the Petroleum Activities Program including all relevant infrastructure.....	45
Table 3-4: Summary of Petroleum Activities Program timing.....	48
Table 3-5: Typical TSHD vessel parameters	51
Table 3-6: Typical rock installation vessel parameters	52
Table 3-7: Typical construction vessel parameters.....	52
Table 3-8: Commonwealth waters subsea infrastructure crossings.....	54
Table 3-9: Specifications of a typical SWLB.....	58
Table 3-10: Specifications of the PV	59
Table 3-11: Specifications for a typical DP2 B-type.....	59
Table 3-12: Typical construction vessel parameters.....	60
Table 4-1: Hydrocarbon spill thresholds used to define EMBA for surface and in-water hydrocarbons.....	66
Table 4-2: Summary of MNES identified by the EPBC Act Protected Matters Search Tool (PMST) as potentially occurring within the Operational Area.....	71
Table 4-3: Summary of MNES identified by the EPBC Act Protected Matters Search Tool (PMST) as potentially occurring within the EMBA	71
Table 4-4: Summary of seabed features, sediments, epifauna and infauna along the proposed trunkline route.	72
Table 4-5: Summary of benthic habitat analysis of ROV footage within the Montebello AMP	77
Table 4-6: Habitats and communities within the Operational Area, Zone of Influence and EMBA .	83
Table 4-7: Threatened and Migratory fish, shark and ray species predicted to occur within the Operational Area and EMBA.....	85
Table 4-8: Fish, shark and ray BIAs within the Operational Area and EMBA.....	85
Table 4-9: Threatened and Migratory marine reptile species predicted to occur within the Operational Area and EMBA.....	87
Table 4-10: Marine turtle BIAs within the Operational Area and EMBA	87
Table 4-11: Habitat Critical to the survival of marine turtle species predicted to occur within the Operational Area and EMBA.....	89
Table 4-12: Records of nesting behaviour of green, flatback and hawksbill turtles on islands of the Dampier Archipelago (CALM, 1990; Pendoley et al., 2016; Biota, 2009).....	93
Table 4-13: Threatened and Migratory marine mammal species predicted to occur within the Operational Area and EMBA.....	94
Table 4-14: Marine mammal BIAs within the Operational Area and EMBA	95
Table 4-15: Threatened and migratory seabird and migratory shorebird species predicted to occur within the Operational Area and EMBA.....	100
Table 4-16: Seabird and shorebird BIAs within the Operational Area and EMBA	102
Table 4-17: Seasonal sensitivities for key seabirds and shorebirds with known breeding in the Dampier Archipelago	103
Table 4-18: Key seasonal sensitivities for protected migratory species identified as occurring within the Operational Area.....	107

Table 4-19: KEFs within the Operational Area and EMBA..... 108

Table 4-20: Established protected places and other sensitive areas overlapping the Operational Area and EMBA 110

Table 4-21: Cultural, heritage, socio and economic values of the Montebello and Dampier Marine Parks 112

Table 4-22: Summary of Native Title Claims, Determinations and ILUAs which overlap or are coastally adjacent to the EMBA..... 115

Table 4-23: Summary of Commonwealth and State Marine Park Management Plan EMBA overlap 117

Table 4-24: Cultural features and heritage values identified in publicly available literature 120

Table 4-25: Values identified in the Scarborough Cultural Heritage Management Plan (Woodside 2023b) 128

Table 4-26: Feedback Received via Consultation to Inform Existing Environment Description... 141

Table 4-27: Summary of cultural features and heritage values..... 156

Table 4-28: Commonwealth and State commercial fisheries overlapping the Operational Area and EMBA 168

Table 4-29: Other oil and gas facilities located within 50 km of the Operational Area 178

Table 5-1: Categories of relevant persons 200

Table 5-2: Methodology for identifying relevant persons within the EMBA undertaken under subcategory 11A(1)(d) – by category 201

Table 5-3: Assessment of relevance 206

Table 6-1: Concurrent operations, including both activities within this EP Petroleum Activities Program and the Scarborough D&C activities 250

Table 6-2: Comparison of EP EPOs to the relevant OPP EPOs 252

Table 6-3: Environmental Risk analysis and summary 265

Table 6-4: Dredging (trenching and borrow ground), spoil disposal and backfill seabed disturbance summary 275

Table 6-6: Pipeline and infrastructure crossings..... 294

Table 6-7: Trunkline installation and associated activities seabed disturbance summary (Commonwealth waters) 296

Table 6-9: Potential Petroleum Activities Program within KEFs and disturbance 299

Table 6-10: Estimated seabed disturbance summary (Commonwealth waters) 300

Table 6-11: Indicative trunkline installation and stabilisation activities within 20 km of land Activity (light modelling) 308

Table 6-13: Sources of aspect, and the operating frequency and noise levels 329

Table 6-14: Concurrent activities contributing to cumulative underwater vessel noise..... 330

Table 6-15: Thresholds for PTS, TTS and behavioural response onset in low-frequency (LF) and high-frequency (HF) cetaceans for impulsive and continuous noise 332

Table 6-16: Maximum predicted horizontal distances (R_{max}) to PTS, TTS and behavioural response thresholds in cetaceans, for all 12 scenarios..... 333

Table 6-17: Summary of animat simulation results for migrating pygmy blue whales indicating the maximum of the 95th percentile exposure ranges (in km) over all scenarios. The maximum probability of animats being exposed above threshold within the $ER_{95\%}$ is also provided for all modelled scenarios 334

Table 6-18: Thresholds for PTS, TTS and behavioural response onset in marine turtles for impulsive and continuous noise 336

Table 6-19: Maximum predicted horizontal distances (R_{max}) to PTS and TTS thresholds in marine turtles..... 337

Table 6-20: Thresholds for PTS, TTS and behavioural response onset in fish, sharks and rays for impulsive and continuous noise 337

Table 6-21: Estimated contingent Trunkline discharges 359

Table 6-22: Potential chemicals for water treatment..... 360

Table 6-23: Ecotoxicological test results for Hydrosure 0-3670R 361

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 6-24: Species protection concentrations for Hydrosure 0-3670R..... 361

Table 6-25: Average and maximum distances to achieve the threshold concentration at the 99% and 95% species protection 361

Table 6-26: Average and maximum distances to achieve the threshold concentration at the 99% and 95% species protection 362

Table 6-27: Credible hydrocarbon spill scenarios..... 376

Table 6-28: Spill locations for 2000 m³ marine diesel instantaneous release..... 376

Table 6-29: Characteristics of marine diesel 376

Table 6-30: Summary of environmental impact thresholds applied to the quantitative hydrocarbon spill risk modelling results 378

Table 6-31: The Bonn Agreement oil appearance code 378

Table 6-32: Summary of credible hydrocarbon spill scenario as a result of vessel collision..... 381

Table 6-33: Characteristics of the marine diesel 382

Table 6-34: Environment that May Be Affected – Key receptor locations and sensitivities with the summary hydrocarbon spill contact for a 2,000 m³ instantaneous marine diesel spill at three release locations..... 395

1 INTRODUCTION

1.1 Overview

The Scarborough gas resource, located in Commonwealth waters approximately 375 km west-northwest of the Burrup Peninsula, forms part of the Greater Scarborough gas fields, comprising the Scarborough, North Scarborough, Thebe and Jupiter gas fields (Figure 3-1). Woodside Energy Scarborough Pty Ltd (Woodside), as Titleholder under the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009* (Cth) (referred to as the Environment Regulations), proposes to undertake the following petroleum activities as described in Section 3:

- installation and pre-commissioning of the trunkline
- installation of Pipeline End Termination (PLET) and foundations
- seabed intervention activities to support the trunkline.

These activities will hereafter be referred to as the Petroleum Activities Program and form the scope of this Environment Plan (EP).

This EP has been prepared by Woodside as part of the requirements under the Environment Regulations, as administered by the National Offshore Petroleum Safety and Environmental Management Authority (NOPSEMA).

The Petroleum Activities Program as defined in this EP is a part of the broader Scarborough Offshore Project Proposal (Scarborough OPP) accepted by NOPSEMA on 30 March 2020. The Scarborough primary approval process is outlined in Section 1.9.1.1 and Section 3.3 highlights concordance with the Scarborough OPP.

1.2 Defining the Petroleum Activity

The Petroleum Activities Program to be undertaken comprises pipeline construction activities and work and other things that are necessary for, or incidental to the construction of a pipeline as defined under section 211(1)(d)(i) of the OPGGS Act, to be specified in the proposed pipeline licence, which are petroleum activities as defined in Regulation 4 of the Environment Regulations.

1.3 Purpose of the Environment Plan

In accordance with the objectives of the Environment Regulations, the purpose of this EP is to demonstrate that:

- the potential environmental impacts and risks (planned (routine and non-routine) and unplanned) that may result from the Petroleum Activities Program are identified
- appropriate management controls are implemented to reduce impacts and risks to a level that is 'as low as reasonably practicable' (ALARP) and acceptable.
- the Petroleum Activities Program is performed in a manner consistent with the principles of ecologically sustainable development (as defined in Section 3A of the Environment Protection and Biodiversity Conservation Act, 1999 (Cth) (EPBC Act)).

This EP describes the process and resulting outputs of the risk assessment, whereby impacts and risks are managed to ALARP and are acceptable.

The EP defines activity-specific Environmental Performance Outcomes (EPOs), environmental performance standards (EPSs) and measurement criteria (MCs). These form the basis for monitoring, auditing and management of the Petroleum Activities Program to be undertaken by Woodside and its contractors. The implementation strategy (derived from the decision support framework tools) specified within this EP provides Woodside and NOPSEMA with the required level

of assurance that impacts, and risks associated with the activity are reduced to ALARP and are acceptable.

1.4 Scope of the Environment Plan

The scope of this EP covers the activities that define the Petroleum Activities Program, as described in Section 3.

The spatial boundary of the Petroleum Activities Program has been described and assessed using two 'areas', the Trunkline Project Area, (the proposed trunkline from and 1.5 km either side of the proposed trunkline centreline) and the Offshore Borrow Ground Project Area. The combination of the Project Areas defines the Operational Area and the spatial boundary of the Petroleum Activities Program, as described, risk assessed and managed by this EP, including vessel related petroleum activities.

This EP addresses potential environmental impacts from planned activities within the Operational Area and any potential unplanned events that originate from the activity within the Operational Area.

Transit to and from the Operational Area by project vessels as well as port activities associated with these vessels, are not within the scope of this EP. Vessels supporting the petroleum activities operating outside the Operational Area (e.g. transiting to and from port, materials transshipment) are subject to all applicable maritime regulations and other requirements and are not managed by this EP.

1.5 Environment Plan Summary

An EP summary will be prepared based on the material provided in this EP, addressing the items listed in Table 1-1 as required by Regulation 11(4).

Table 1-1: EP Summary

EP Summary material requirement	Relevant section of EP containing EP Summary material
The location of the activity	Section 3.4
A description of the receiving environment	Section 4
A description of the activity	Section 3
Details of the environmental impacts and risks	Section 6
The control measures for the activity	Section 6
The arrangements for ongoing monitoring of the titleholder's environmental performance	Section 7
Response arrangements in the oil pollution emergency plan	Section 7.19
Consultation already undertaken and plans for ongoing consultation	Section 5
Details of the titleholders nominated liaison person for the activity	Section 1.8

1.6 Structure of the Environment Plan

This EP has been structured to reflect the process and requirements of the Environment Regulations as outlined in Table 1-2.

Table 1-2: EP process phases, applicable regulations and relevant section of EP

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
Regulation 10A(a): <i>Is appropriate for the nature and scale of the activity</i>	Regulation 13: <i>Environmental assessment</i> Regulation 14: <i>Implementation strategy for the environment plan</i> Regulation 16: <i>Other information in the environment plan</i>	The principle of 'nature and scale' is applicable throughout the EP.	Section 2 Section 3 Section 4 Section 5 Section 6 Section 7
Regulation 10A(b): <i>Demonstrates that the environmental impacts and risks of the activity will be reduced to as low as reasonably practicable</i>	Regulation 13(1)–13(7): <i>13(1) Description of the activity</i> <i>13(2)(3) Description of the environment</i> <i>13(4) Requirements</i> <i>13(5)(6) Evaluation of environmental impacts and risks</i> <i>13(7) Environmental Performance Outcomes and standards</i>	Set the context (activity and existing environment). Define 'acceptable' (the requirements, the corporate policy, relevant persons). Detail the impacts and risks.	Section 1 Section 2 Section 3 Section 4 Section 5 Section 6 Section 7
Regulation 10A(c): <i>Demonstrates that the environmental impacts and risks of the activity will be of an acceptable level</i>	Regulation 16(a) to 16(c): <i>A statement of the titleholder's corporate environmental policy</i> <i>A report on all consultations between the titleholder and any relevant person</i>	Evaluate the nature and scale. Detail the control measures – ALARP and acceptable.	
Regulation 10A(d): <i>Provides for appropriate Environmental Performance Outcomes, environmental performance standards and measurement criteria</i>	Regulation 13(7): <i>Environmental Performance Outcomes and standards</i>	Environmental Performance Outcomes (EPO). Environmental performance standards (EPS). Measurement criteria (MC).	Section 6
Regulation 10A(e): <i>Includes an appropriate implementation strategy and monitoring, recording and reporting arrangements</i>	Regulation 14: <i>Implementation strategy for the environment plan</i>	Implementation strategy, including: <ul style="list-style-type: none"> • Environmental Management System (EMS) • Performance monitoring • Oil Pollution Emergency Plan (OPEP – per Table 7-12) and scientific monitoring • Ongoing consultation 	Section 7

Criteria for acceptance	Content requirements/relevant regulations	Elements	Section of EP
<p>Regulation 10A(f): <i>Does not involve the activity or part of the activity, other than arrangements for environmental monitoring or for responding to an emergency, being undertaken in any part of a declared World Heritage property within the meaning of the Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act)</i></p>	<p>Regulation 13(1)–13(3): 13(1) <i>Description of the activity</i> 13(2) <i>Description of the environment</i> 13(3) <i>Without limiting [Regulation 13(2)(b)], relevant values and sensitivities may include any of the following:</i> (a) <i>the world heritage values of a declared World Heritage property within the meaning of the EPBC Act;</i> (b) <i>the national heritage values of a National Heritage place within the meaning of that Act;</i> (c) <i>the ecological character of a declared Ramsar wetland within the meaning of that Act;</i> (d) <i>the presence of a listed threatened species or listed threatened ecological community within the meaning of that Act;</i> (e) <i>the presence of a listed migratory species within the meaning of that Act;</i> (f) <i>any values and sensitivities that exist in, or in relation to, part or all of:</i> (i) <i>a Commonwealth marine area within the meaning of that Act; or</i> (ii) <i>Commonwealth land within the meaning of that Act.</i></p>	<p>No activity, or part of the activity, undertaken in any part of a declared World Heritage property.</p>	<p>Section 3 Section 4</p>
<p>Regulation 10A(g): (i) <i>the titleholder has carried out the consultations required by Division 2.2A</i> (ii) <i>the measures (if any) that the titleholder has adopted, or proposes to adopt, because of the consultations are appropriate</i></p>	<p>Regulation 11A: <i>Consultation with relevant authorities, persons and organisations, etc.</i> Regulation 16(b): <i>A report on all consultations between the titleholder and any relevant person</i></p>	<p>Consultation undertaken in the preparation of this EP.</p>	<p>Section 4</p>
<p>Regulation 10A(h): <i>Complies with the Act and the regulations</i></p>	<p>Regulation 13(4)a: <i>Describe the requirements, including legislative requirements, that apply to activity and are relevant to the environmental management of the activity</i> Regulation 15: <i>Details of the Titleholder and liaison person</i> Regulation 16(a): <i>A statement of the titleholder's corporate environmental policy</i> Regulation 16(c): <i>Details of all reportable incidents in relation to the proposed activity</i></p>	<p>All contents of the EP must comply with the <i>Offshore Petroleum and Greenhouse Gas Storage Act 2006</i> and the <i>Environment Regulations</i></p>	<p>Section 1 Section 3 Section 6 Appendix A Appendix B</p>

1.7 Description of the Titleholder

Woodside is Operator of the various joint ventures relating to the Scarborough Project, which comprises the Scarborough, North Scarborough, Thebe and Jupiter fields. The joint ventures comprise both Woodside Energy Scarborough Pty Ltd and Woodside Energy (Australia) Pty Ltd.

As Australia's leading LNG operator, Woodside operated 6% of global LNG supply in 2020. LNG is a lower-emissions, competitive fuel ideally suited to supporting decarbonisation and improving air quality. Woodside is working to improve its energy efficiency, offset emissions, reduce emissions intensity and explore options for lower-carbon energy. Woodside has set clear targets to reduce our net emissions in line with our aspiration to achieve net zero by 2050.

In Western Australia, Woodside is building on more than 30 years of experience and progressing development of the Scarborough gas resource through the world-class Pluto LNG facility. Woodside is also connecting Pluto LNG with the landmark North West Shelf Project to create an integrated LNG production hub on the Burrup Peninsula.

Woodside recognises that strong environmental performance is essential to success and continued growth. Woodside has an established methodology to identify impacts and risks and assess potential consequences of activities. Strong partnerships, sound research and transparency are the key elements of Woodside's approach to the environment.

1.8 Details of Titleholder, Liaison Person and Public Affairs Contact

In accordance with Regulation 15 of the Environment Regulations, details of the titleholder, liaison person and arrangements for the notification of changes are described below.

1.8.1 Titleholder

Woodside Energy Scarborough Pty Ltd:
11 Mount Street, Perth, Western Australia
Telephone: 08 9348 4000
Fax Number: 08 9214 2777
ABN: 650 177 227

1.8.2 Nominated Liaison Person

Andrew Winter
Corporate Affairs Manager
11 Mount Street, Perth, Western Australia
Phone: 08 9348 4000
Fax Number: 08 9214 2777
feedback@woodside.com.au

1.8.3 Arrangements for Notifying of Change

Should the titleholder, titleholder's nominated liaison person or the contact details for either change, then NOPSEMA are to be notified of the change in writing within two weeks or as soon as practicable.

1.8.4 Woodside Management System

The Woodside Management System (WMS) provides a structured framework of documentation to set common expectations governing how all employees and contractors at Woodside will work. Many of the standards presented in Section 2.2.3 are drawn from the WMS documentation, which comprises of four elements: Compass and Policies, Expectations, Processes and Procedures, and Guidelines, outlined below (and illustrated in Figure 1-1):

- **Compass and Policies:** Set the enterprise-wide direction for Woodside by governing our behaviours, actions and business decisions and ensuring we meet our legal and other external obligations.
- **Expectations:** Set essential activities or deliverables required to achieve the objectives of the Key Business Activities and provide the basis for development of processes and procedures.
- **Processes and Procedures:** Processes identify the set of interrelated or interacting activities which transforms inputs into outputs, to systematically achieve a purpose or specific objective. Procedures specify what steps, by whom and when are required to carry out an activity or a process.
- **Guidelines:** Provide recommended practice and advice on how to perform the steps defined in Procedures, together with supporting information and associated tools. Guidelines provide advice on: how activities or tasks may be performed; information that may be taken into consideration; or, how to use tools and systems.

Figure 1-1: The four major elements of the WMS framework

The WMS is organised within a business process hierarchy based upon key business activities to ensure the system remains independent of organisation structure, is globally applicable and scalable wherever required. These business activities are grouped into management, support and value stream activities as shown in Figure 1-2. The value stream activities capture, generate and deliver value—through the exploration and production (E and P) lifecycle. The management activities influence all areas of the business, while support activities may influence one or more value stream activities.

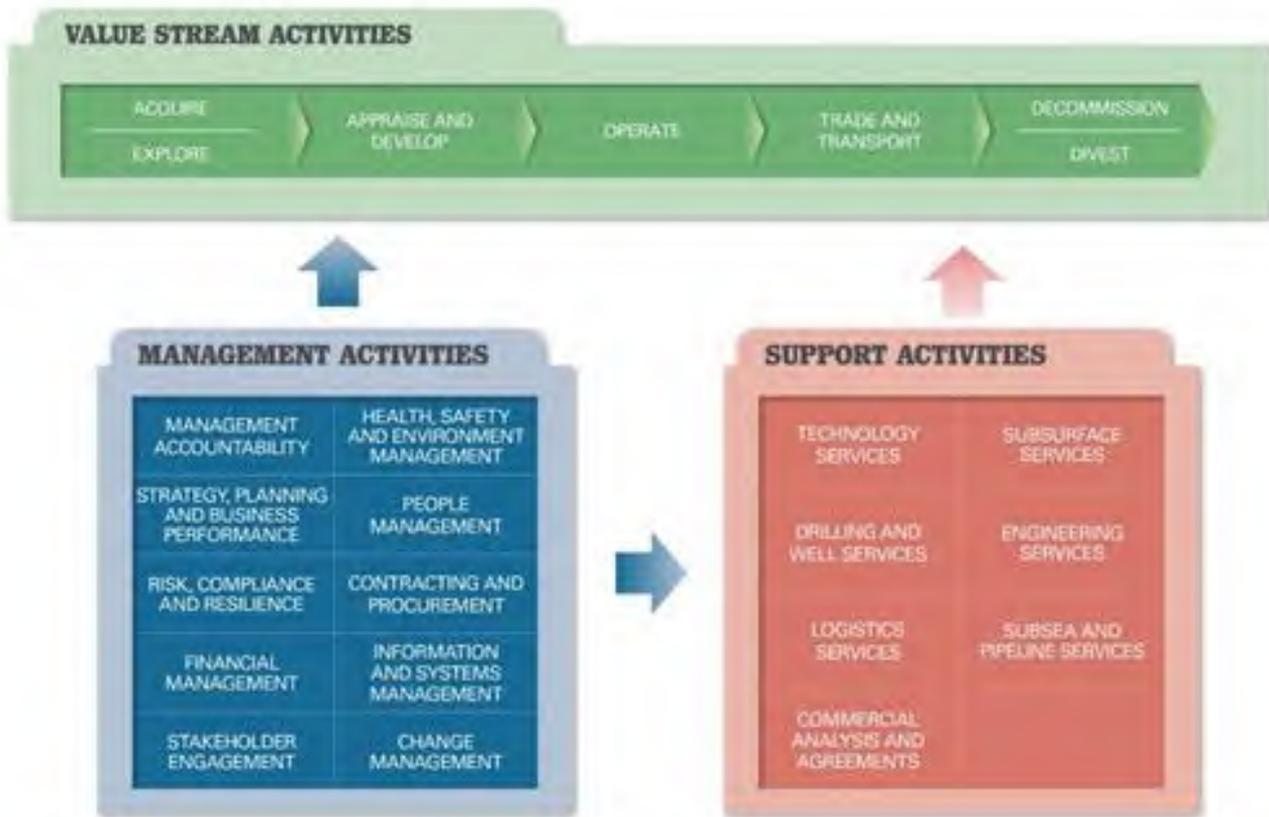

Figure 1-2: The WMS business process hierarchy

1.8.5 Environment and Biodiversity Policy

In accordance with Regulation 16(a) of the Environment Regulations, Woodside’s Corporate Environment and Biodiversity Policy is provided in Appendix A of this EP.

1.9 Description of Relevant Requirements

In accordance with Regulation 13(4) of the Environment Regulations, a description of requirements, including legislative requirements, that apply to the activity and relevant to the management of risks and impacts of the Petroleum Activities Program are detailed in Appendix B.

1.9.1 Offshore Petroleum and Greenhouse Gas Storage Act 2006

The Commonwealth *Offshore Petroleum and Greenhouse Gas Storage Act 2006* (OPGGGS Act) provides the regulatory framework for all offshore petroleum exploration and production and greenhouse gas activities in Commonwealth waters (the ocean area beyond three nautical miles to the outer extent of the Australian Exclusive Economic Zone at 200 nautical miles).

The Act regulates all offshore petroleum activities, including decommissioning as set out in Section 270 and 572 of the OPGGS Act. While there are no immediate plans for decommissioning (the scope of this EP is for the installation of the trunkline for future operations) all equipment, being installed above the mudline, design allows for removal. Subsection 572(2) provides that a titleholder must maintain in good condition and repair all structures that are, and all equipment and other property that is in the title area and used in connection with the operations.

The regulatory framework establishes the National Offshore Petroleum Safety and Environment Management Authority as the regulator. The OPGGS Regulations, including the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009* (the Environment Regulations), ensure that any petroleum activities are carried out in a manner:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- consistent with the principles of ecologically sustainable development (as set out in the EPBC Act)
- by which the environmental impacts and risks of the activity will be reduced to ALARP
- by which the environmental impacts and risks of the activity will be of an acceptable level.

1.9.1.1 Offshore Project Proposal

Woodside submitted the Scarborough Offshore Project Proposal (OPP) to NOPSEMA for assessment in February 2019 and received acceptance in March 2020.

The OPP provided the detail and evaluation of potential impacts and risks from the key components of the Scarborough Development. These key components include:

- Wells – drilling of the Scarborough and North Scarborough gas fields, with potential for future fields (including Thebe and Jupiter gas fields) to be tied back to the facility
- Trunkline installation – installation of a gas trunkline to extend for a total of 430 km using trenching and backfill (for nearshore only)
- Surface infrastructure – Floating Production Unit (FPU) in approximately 900 m of water over the Scarborough reservoir
- Subsea infrastructure - infield infrastructure, including wellheads, manifolds, flowlines and umbilicals, trunkline and communications lines
- Commissioning – Commissioning of the overall production system will be conducted from the FPU once on location
- Operations – hydrocarbon extraction and processing will take place at the FPU, to meet the trunkline specifications. Gas will be exported via the trunkline.
- Decommissioning - the facilities will be decommissioned in accordance with good oilfield practice and relevant legislation and practice at the time

In accordance with Regulation 9 and 6 a titleholder must have submitted and have an accepted EP in place before commencing an activity. Therefore, a number of EPs will be developed and submitted to NOPSEMA over the next 5-years, to cover components of the Scarborough Development, such as those listed above, including commissioning and operations of the FPU.

Each EP will have a defined Petroleum Activities Program and will detail and evaluate the risks and impacts, demonstrating they have been reduced to ALARP and are acceptable for that particular Program. The Scarborough OPP sets out the environmental performance outcomes (EPOs) for the project and the level of performance to be achieved, to ensure that environmental impacts and risks will be of an acceptable level and the project is consistent with the principles of ecologically sustainable development. These EPOs will be adopted into each EP, where relevant to the particular scope of the EP.

In accordance with Regulation 31 of the Environment Regulations, references to the Scarborough OPP have been made throughout this EP. The approved Scarborough OPP is available on the NOPSEMA website: [Scarborough Offshore Project Proposal » NOPSEMA](#).

1.9.2 Environmental Protection Act 1986

The Environmental Protection Act 1986 (WA) provides for the prevention, control and abatement of pollution and environmental harm, for the conservation, preservation, protection, enhancement and management of the environment and for matters incidental to or connected with the foregoing.

In December 2018, Woodside submitted a referral and supplementary report for assessment by EPA in accordance with Part IV (section 38) of the Environment Protection Act 1986 (Assessment no. 2194). EPA decided to assess the project based on the referral information and additional

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Page 25 of 582

Uncontrolled when printed. Refer to electronic version for most up to date information.

information, including a dredging and spoil disposal management plan (DSDMP). The Minister for Environment approved the project under Ministerial Statement No. 1172 on 11 August 2021.

The legislative requirements in the State jurisdiction that are considered relevant to the environmental management of this Petroleum Activities Program are provided in Table 1-3. These are a subset of the DSDMP requirements set out in Condition 6 of MS No 1172, and have been selected in context of the potential for suspended sediments from dredging activities in Commonwealth waters to disperse into State waters.

Table 1-3: Activity relevant Condition 6 requirements

Clause	Clause details	Relevant Section of the EP
6-1	The proponent must ensure implementation of the proposal achieves the following Environmental Protection Outcomes:	
6-1(1)	No detectable net reduction of live coral cover at any of the coral impact monitoring locations attributable to the proposal	Section 6.7.2
6-1(2)	Avoid where possible and otherwise minimise direct and indirect impacts on marine fauna listed as specially protected fauna under the <i>Biodiversity Conservation Act 2016</i> .	Section 6.8.7
6-3(1)	A requirement for all dredging and spoil disposal activities to be managed with the objective of achieving the EPOs required by condition 6-1	Noted
6-3(2)	A benthic habitat map showing the extent and distribution of benthic communities and habitats	Section 4.5.2
6-3(3)	Sediment plume modelling outputs to inform predicted impacts and losses of benthic communities and habitats, including a cumulative loss assessment	Section 6.7.2
6-3(4)	Presentation of the sediment plume outputs in an impact zonation scheme	Section 6.7.2
6-3(5)	Management trigger indicators based on pressure response pathways and proposed adaptive management actions	Section 7.10
6-3(6)	Monitoring program including reference and impact monitoring site locations and methods (including timing) to provide data to allow assessment against the management triggers indicators and the EPO required by condition 6-1(1), and to inform adaptive management actions	Section 7.10
6-3(7)	A tiered monitoring/management feedback loop to manage dredging spoil disposal and backfill operations to achieve EPO required by condition 6-1(1)	Section 7.10
6-3(11)	Procedures for determining whether any management trigger exceedances are attributable to the implementation of the proposal	Section 7.10
6-3(12)	Contingency management strategies to be employed if management triggers are reached as a result of the proposal	Section 7.10

1.9.3 Sea Dumping Act

In Australia dumping at sea of dredged material is regulated under the Environment Protection (Sea Dumping) Act 1981 (Sea Dumping Act). Under the Sea Dumping Act, the Commonwealth aims to minimise pollution threats by:

- prohibiting, without a permit, ocean dumping of material that is considered to be “seriously harmful” and
- regulating permitted waste disposal.

Permit applications are assessed under a regulatory framework, which encompasses evaluating disposal alternatives and waste minimisation procedures, site and impact assessments and management and monitoring programs. A sea dumping permit (SD2019-3982) for this activity was

granted to Woodside in December 2019. The scope of this sea dumping permit includes the use of spoil ground 5A (an activity proposed in this EP).

1.9.4 Environment Protection and Biodiversity Conservation Act 1999 (EPBC Act)

One of the objectives of the EPBC Act is to protect and manage nationally and internationally important flora, fauna, ecological communities and heritage places in Australia. These are defined under Part 3 of the Act as “Matters of National Environmental Significance” (MNES). The EPBC Act sets a regime which aims to ensure actions taken on (or impacting upon) Commonwealth land or waters are consistent with the principles of ecological sustainable development. When a person proposes to take an action that they believe may need approval under the EPBC Act, they must refer the proposal to the Commonwealth Minister for Environment.

In relation to offshore petroleum activities in Commonwealth waters, in accordance with the “Streamlining Offshore Petroleum Approvals Program” (the Program), requirements under the EPBC Act are now administered by NOPSEMA, commencing February 2014. The Program requires any offshore petroleum activities, authorised by the OPGGS Act to be conducted in accordance with an accepted EP. The definition of ‘environment’ in the Program covers all matters protected under Part 3 of the EPBC Act.

1.9.4.1 Recovery Plans and Threat Abatement Plans

Under s139(1)(b) of the EPBC Act, the Environment Minister must not act inconsistently with a recovery plan for a listed threatened species or ecological community or a threat abatement plan for a species or community protected under the Act. Similarly, under s268 of the EPBC Act:

“A Commonwealth agency must not take any action that contravenes a recovery plan or a threat abatement plan.”

In respect to offshore petroleum activities in Commonwealth waters, these requirements are implemented by NOPSEMA via the commitments included in the Program¹. Commitments relating to listed threatened species and ecological communities under the Act are included in the Program Report (Commonwealth of Australia, 2014).

1.9.4.2 Australian Marine Parks

Under the EPBC Act, Australian Marine Parks (AMPs), formally known as Commonwealth Marine Reserves, are recognised for conserving marine habitats and the species that live and rely on these habitats. The Director of Marine Parks (DNP) is responsible for managing AMP’s (supported by Parks Australia), and is required to publish management plans for them. Other parts of the Australian Government must not perform functions or exercise powers in relation to these parks that are inconsistent with management plans (s.362 of the EPBC Act). Relevant AMPs are identified in Section 4.8 and described in Appendix H and the Scarborough OPP. The North-west Marine Parks Network Management Plan (DNP, 2018a) and the South west Marine Parks Network Management Plan (DNP, 2018b) describe the requirements for managing the marine parks that are relevant to this EP.

Specific zones within the AMPs have been allocated conservation objectives as stated below (International Union for Conservation of Nature (IUCN) Protected Area Category) based on the Australian IUCN reserve management principles outlined in Schedule 8 of the *Environment Protection and Biodiversity Conservation Regulations 2000* (Cth) (the EPBC Regulations 2000):

- Special Purpose Zone (IUCN category VI)—managed to allow specific activities though special purpose management arrangements while conserving ecosystems, habitats and native species. The zone allows or prohibits specific activities.

¹ Program as described in the Program Report – Strategic Assessment of the environmental management authorization process for petroleum and greenhouse gas storage activities administered at Offshore Petroleum Safety and Environmental Management Authority under the *Offshore Petroleum and Greenhouse Gas Storage Act 2006* February 2014.

- Sanctuary Zone (IUCN category Ia)—managed to conserve ecosystems, habitats and native species in as natural and undisturbed a state as possible. The zone allows only authorized scientific research and monitoring.
- National Park Zone (IUCN category II)—managed to protect and conserve ecosystems, habitats and native species in as natural a state as possible. The zone only allows non-extractive activities unless authorised for research and monitoring.
- Recreational Use Zone (IUCN category IV)—managed to allow recreational use, while conserving ecosystems, habitats and native species in as natural a state as possible. The zone allows for recreational fishing, but not commercial fishing.
- Habitat Protection Zone (IUCN category IV)—managed to allow activities that do not harm or cause destruction to seafloor habitats, while conserving ecosystems, habitats and native species in as natural a state as possible.
- Multiple Use Zone (IUCN category VI)—managed to allow ecologically sustainable use while conserving ecosystems, habitats and native species. The zone allows for a range of sustainable uses, including commercial fishing and mining where they are consistent with park values.

The proposed activity will include works through the Montebello Marine Park Multiple Use Zone. In accordance with the North-west Marine Parks Network Management Plan (DNP, 2018a), petroleum activities including transportation of minerals by pipeline, and oil spill response are permissible subject to approval in Multiple Use Zone (IUCN category VI) and Special Purpose Zone Trawl (IUCN category VI). Proposed mining operations conducted under usage rights that existed immediately before the declaration of a marine park do not require approval.

Petroleum activities (including environmental monitoring in connection with a particular petroleum activity) occurring within these zones are approved by a class approval (DNP, 2018a). Conditions of the Class Approval that are considered relevant to the scope of this EP are provided in Table 1-4.

Table 1-4: Conditions of Class Approval relevant to the Petroleum Activities Program

Condition Number	Condition	Relevant Section of the EP
1	The Approved Actions must be conducted in accordance with: <ul style="list-style-type: none"> (a) an Environment Plan accepted under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009; - (b) the EPBC Act; (c) the EPBC Regulations (d) the North-west Network Management Plan; (e) any prohibitions, restrictions or determinations made under the EPBC Regulations by the Director of National Parks; and (f) all other applicable Commonwealth and state laws (to the extent those laws are capable of operating concurrently with the laws and instruments described in paragraphs (a) to (e)). 	Conditions 1a, b, c and f are met by the submitted EP. 1d the impacts on the marine park values have been considered Section 6.7, 0 and 6.9.4 1e Consultation has been undertaken with the Director of National Parks and no prohibitions, restrictions or determinations have been made (Section 5)
2	If requested by the Director of National Parks, an Approved Person must notify the Director prior to conducting Approved Actions within Approved Zones.	Section 7.17 describes requirements to notify the DNP prior to activities within the Montebello Multiple Use Zone.
3	If requested by the Director of National Parks, an Approved Person must provide the Director with information relating to undertaking the Approved Actions (or gathered while undertaking the Approved Actions), that is relevant to the Director's management of the Approved Zones.	If requested by the Director of National Parks, information relating to undertaking the Approved Actions (or gathered while undertaking the Approved Actions), that is relevant to the Director's management of the Approved Zones will be provided.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Activities will be undertaken in an area adjacent to the Dampier Marine Park, however not within the marine park noting a 250 m buffer is to be maintained. Demonstration that the activities are not inconsistent with the management plans are provided in Section 6.

1.9.4.3 World Heritage Areas

Australian World Heritage management principles are prescribed in Schedule 5 of the EPBC Regulations 2000. Management principles that are considered relevant to the scope of this EP are provided in Table 1-5.

Table 1-5: Relevant management principles under Schedule 5 – Australian World Heritage management principles of the EPBC Act

Number	Principle	Relevant Section of the EP
3	<p>Environmental impact assessment and approval</p> <p>3.01 This principle applies to the assessment of an action that is likely to have a significant impact on the World Heritage values of a property (whether the action is to occur inside the property or not).</p> <p>3.02 Before the action is taken, the likely impact of the action on the World Heritage values of the property should be assessed under a statutory environmental impact assessment and approval process.</p> <p>3.03 The assessment process should:</p> <p>(a) identify the World Heritage values of the property that are likely to be affected by the action; and</p> <p>(b) examine how the World Heritage values of the property might be affected; and</p> <p>(c) provide for adequate opportunity for public consultation.</p> <p>3.04 An action should not be approved if it would be inconsistent with the protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.</p> <p>3.05 Approval of the action should be subject to conditions that are necessary to ensure protection, conservation, presentation or transmission to future generations of the World Heritage values of the property.</p> <p>3.06 The action should be monitored by the authority responsible for giving the approval (or another appropriate authority) and, if necessary, enforcement action should be taken to ensure compliance with the conditions of the approval.</p>	<p>3.01 and 3.02: Assessment of significant impact on World Heritage values is included in Section 6. Principles are met by the submitted EP.</p> <p>3.03 (a) and (b): World Heritage values are identified in Section 4.8 and considered in the assessment of impacts and risks for the Petroleum Activity in Section 6.</p> <p>3.03 (c): Consultation and feedback received in relation to impacts and risks to the Ningaloo Coast and Shark Bay World Heritage Areas (which are both within the scope of this EP) are outlined in Section 5.</p> <p>3.04, 3.05 and 3.06: Principles are considered to be met by the acceptance of this EP.</p>

Note that Section 1 – General Principles and 2 – Management Planning of Schedule 5 are not considered relevant to the scope of this EP and, therefore, have not been included.

2 ENVIRONMENT PLAN PROCESS

2.1 Overview

This section outlines the process Woodside follows to prepare the EP once an activity has been defined as a petroleum activity. The process (Section 2.2) describes the environmental risk management methodology that is used to identify, analyse and evaluate risks to meet ALARP and acceptability requirements and to develop EPOs and EPSs. This section also describes Woodside's risk management methodologies applicable to implementation strategies applied during the activity.

Regulation 13(5) of the Environment Regulations requires the detailing of environmental impacts and risks, and evaluation appropriate to the nature and scale of each impact and risk associated with the Petroleum Activities Program. The objective of the risk assessment process, described in this section, is to identify risks and associated impacts of an activity, so that they can be assessed, and appropriate control measures applied to eliminate, control or mitigate the impact/risk to ALARP and determine if the impact or risk level is acceptable.

Environmental impacts and risks assessed include those directly and indirectly associated with the Petroleum Activities Program and includes potential emergency and accidental events.

Planned activities (routine and non-routine) have the potential for inherent environmental impacts. An environmental risk is an unplanned event with the potential for impact (termed risk 'consequence').

Herein, potential impact from planned activities are termed 'impacts', and 'risks' are associated with unplanned events with the potential for impact (should the risk be realised), with such impact termed potential 'consequence'.

2.2 Environmental Risk Management Methodology

An assessment of the impacts and risks associated with the Petroleum Activities Program has been undertaken in accordance with Woodside's Environment Impact Assessment Guideline and Risk Assessment Procedure. This guideline and procedure set out the broad principles and high-level steps for assessing environmental impacts across the lifecycle of Woodside's activities and managing these during project execution.

The key steps of the Woodside impact and risk management process are comprised of the:

- environmental impact and risk assessment
- communication and consultation that informs the assessment and ongoing environmental performance of the activity
- steps required during implementation of the activity including to monitor, review and report.

2.2.1 Establish the Context

Context is established by considering the proposed activities associated with a Petroleum Activities Program, and the environment in which the activities are planned to take place.

Describing the activity involves the evaluation of whether the activity meets the definition of a "petroleum activity" as defined in the Environment Regulations. The activity is then described in relation to the location, what is to be undertaken and how - this allows for the identification of environmental aspects for each activity.

2.2.2 Review of the Significance/Sensitivity of Receptors and Levels of Protection

Sensitivity of receptors relevant to the Scarborough Project, and this Petroleum Activities Program, was determined during development of the Scarborough OPP. As set out within the Scarborough

OPP, the sensitivity of all project receptors, was determined to be either low, medium or high based on qualitative expert judgement.

During development of this EP, Scarborough OPP receptor sensitivity determinations were reviewed in the context of any changing legislation or changed knowledge regarding the sensitivity of each receptor. No relevant factors that would change receptor sensitivity (from that determined in the Scarborough OPP) were identified. Receptor sensitivity determinations from the OPP are used in the risk impact assessment summaries for each environmental risk assessment (refer to Section 6).

2.2.3 Environmental Legislation and Other Requirements

In preparing this EP, Woodside has ensured the proposed controls and impact and risk levels are consistent with national and international standards, law and policies (including applicable plans for management and conservation advices, and significant impact guidelines for MNES).

This has included developing the project in accordance with all applicable legislation as identified in Section 1.9, and ensuring the requirements of the species recovery plans and conservation advices have been considered to identify any requirements that may be applicable to the risk assessment.

2.2.4 Impact and Risk Identification

Terminology used for this impact and risk assessment has been taken from the impact and risk management process, which is aligned with ISO 13001:2018 and the requirements of Part 2 (Regulations 6 to 25A) of the OPGGS Regulations.

Impacts and risks of the Scarborough Project were identified in the scoping phase of the Scarborough Project (and presented within the Scarborough OPP). During this phase, the relationships between the environmental aspects identified for the proposed activities and the associated potential impacts and risks for each receptor are established. This EP considers relevant impacts and risks associated with the Scarborough Project's Seabed Intervention and Trunkline Installation campaigns.

Using the Scarborough OPP as a guide, all impacts and risks associated with the Petroleum Activities Program for this EP were identified during the EP scoping phase by undertaking an Environmental Risk and Impact Identification (ENVID) workshop. Impacts, risks and potential consequences were identified based on planned and potential interaction with the activity (based on the description in Section 3), the existing environment (Section 4) and the outcomes of Woodside's stakeholder engagement process (Section 5). The ENVID workshop was undertaken by a multidisciplinary team comprising personnel with sufficient breadth of knowledge, training and experience to reasonably assure that the hazards that may arise in connection with the Petroleum Activity Program in this EP were identified.

Impacts and risks were identified during the ENVID for both planned (routine and non-routine) activities and unplanned (accidents/incidents/emergency conditions) events. During this process, risks identified as not applicable (not credible) were removed from the assessment.

2.3 Impact and Risk Analysis and Evaluation

After identifying impacts and risks, analysis and evaluation is undertaken to determine the extent of the impacts and risks, whether they are acceptable or not, and to identify any impact and risk treatment (or controls) to be implemented.

Impact and risk evaluation are undertaken by assessing the magnitude (i.e. no lasting effect, slight, minor, moderate, major or catastrophic) of the credible environmental impacts from each aspect based on extent, duration, frequency and scale, and then either:

- assigning an impact significance level to each credible environmental impact based on the receptor sensitivity and the magnitude of the impact, OR

- assigning an environmental risk level to each environmental risk based on the receptor sensitivity, magnitude of the consequence, and the likelihood of occurrence.

2.3.1 Impact Evaluation

Impact assessment determines the impact significance of the potential impacts, based on the magnitude and the receptor sensitivity (Figure 2-1).

Magnitude	Receptor Sensitivity			Significance Level
	Low	Medium	High	
Catastrophic	B	A	A	Catastrophic (A)
Major	C	B	A	Major (B)
Moderate	D	C	B	Moderate (C)
Minor	E	D	C	Minor (D)
Slight	F	E	D	Slight (E)
No lasting effect	F	F	E	Negligible (F)

Figure 2-1: Impact significance level

2.3.2 Risk Evaluation

In support of ongoing risk management (a key component of Woodside’s Process Safety Management Framework – refer to Implementation Strategy (Section 7)), Woodside uses the concept of ‘current risk’ and applies a current risk rating to indicate the current or ‘live’ level of risk, considering the controls that are currently in place and regularly effective. Current risk rating is effective in articulating potential divergence from baseline risk, such as if certain controls fail or could potentially be compromised. Current risk ratings aid in the communication and visibility of the risk events, and ensures risk is continually managed to ALARP by identifying risk reduction measures and assessing acceptability.

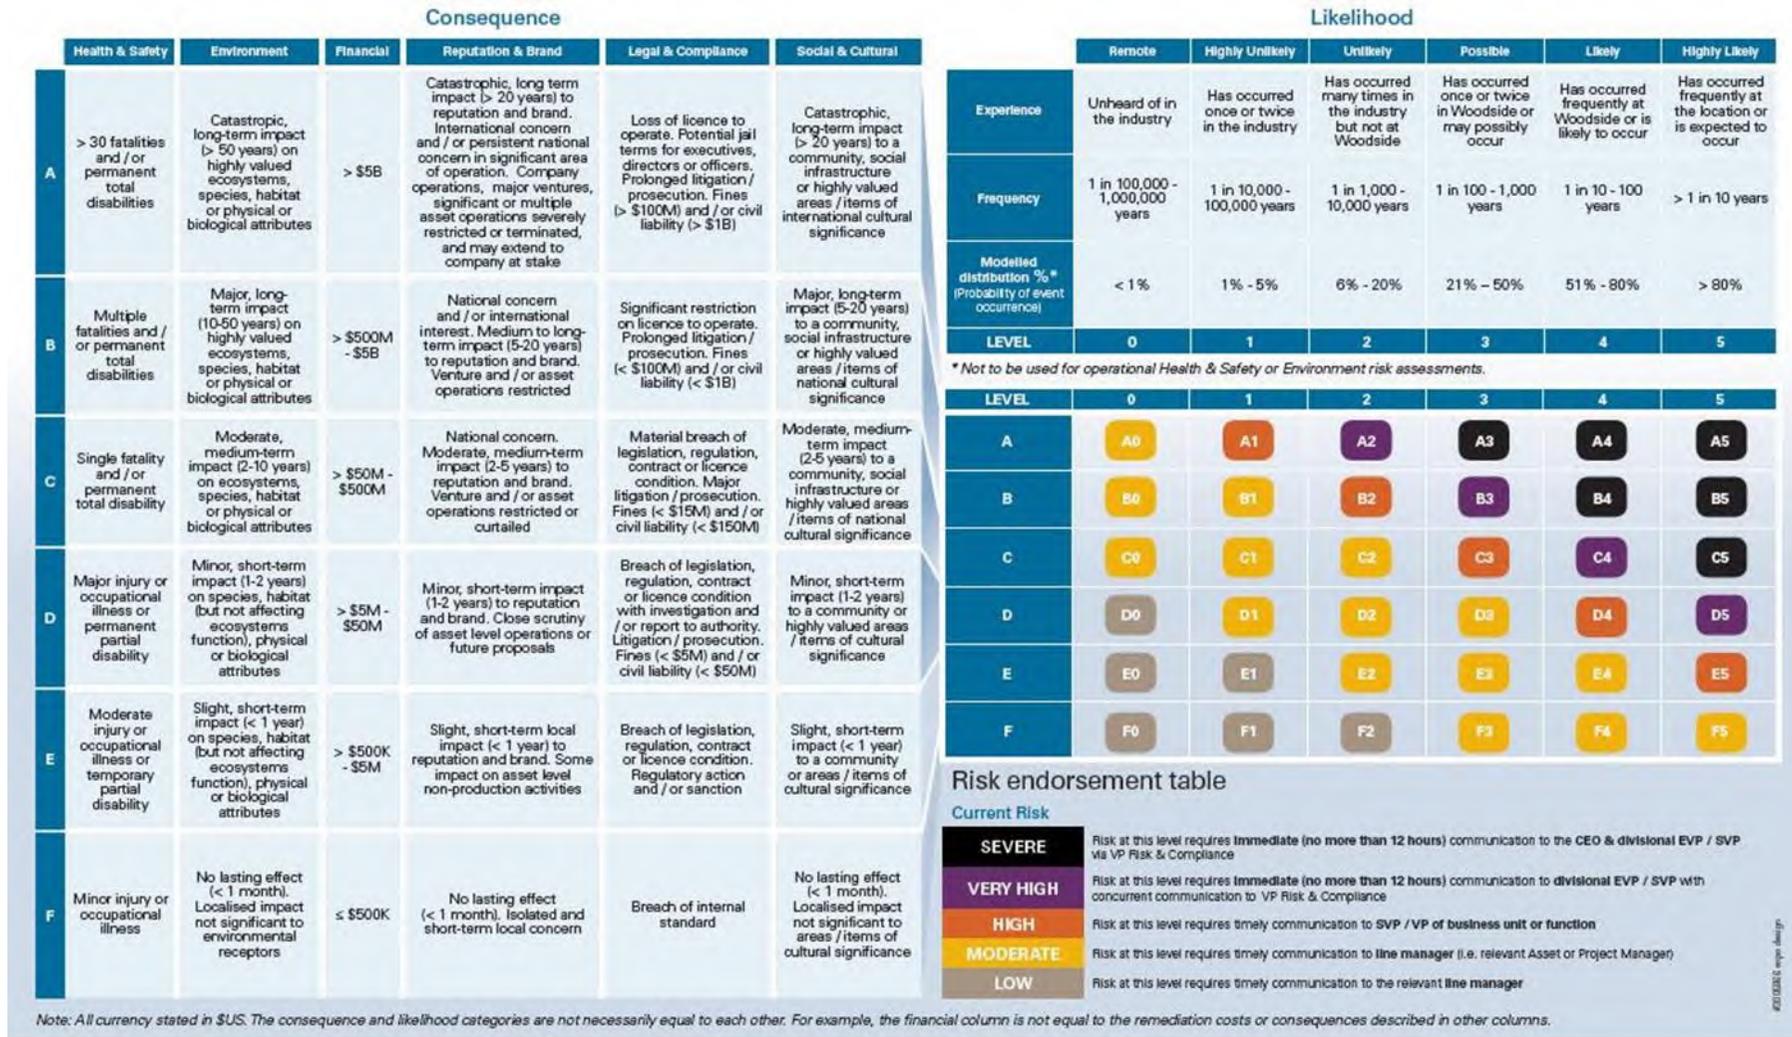

Figure 2-2: Environmental risk levels

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

2.3.3 Decision Support Framework

To support the risk assessment process Woodside’s HSE risk management procedures include the use of a decision support framework based on principles set out in the Guidance on Risk Related Decision Making (Oil and Gas UK, 2014). This concept has been applied during the ENVID or equivalent preceding processes during historical design decisions to determine the level of supporting evidence that may be required to draw sound conclusions regarding risk level and whether the risk is ALARP and acceptable. This is to confirm:

- activities do not pose an unacceptable environmental risk
- appropriate focus is placed on activities where the risk is anticipated to be acceptable and demonstrated to be ALARP
- appropriate effort is applied to the management of risks based on the uncertainty of the risk, the complexity and risk rating (i.e. potential higher order environmental impacts are subject to further evaluation assessment).

The framework provides appropriate tools, commensurate to the level of uncertainty or novelty associated with the risk (referred to as Decision Type A, B or C). The decision type is selected based on an informed discussion around the uncertainty of the risk, then documented in ENVID output.

This framework enables Woodside to appropriately understand a risk, determine if the risk is acceptable and can be demonstrated to be ALARP.

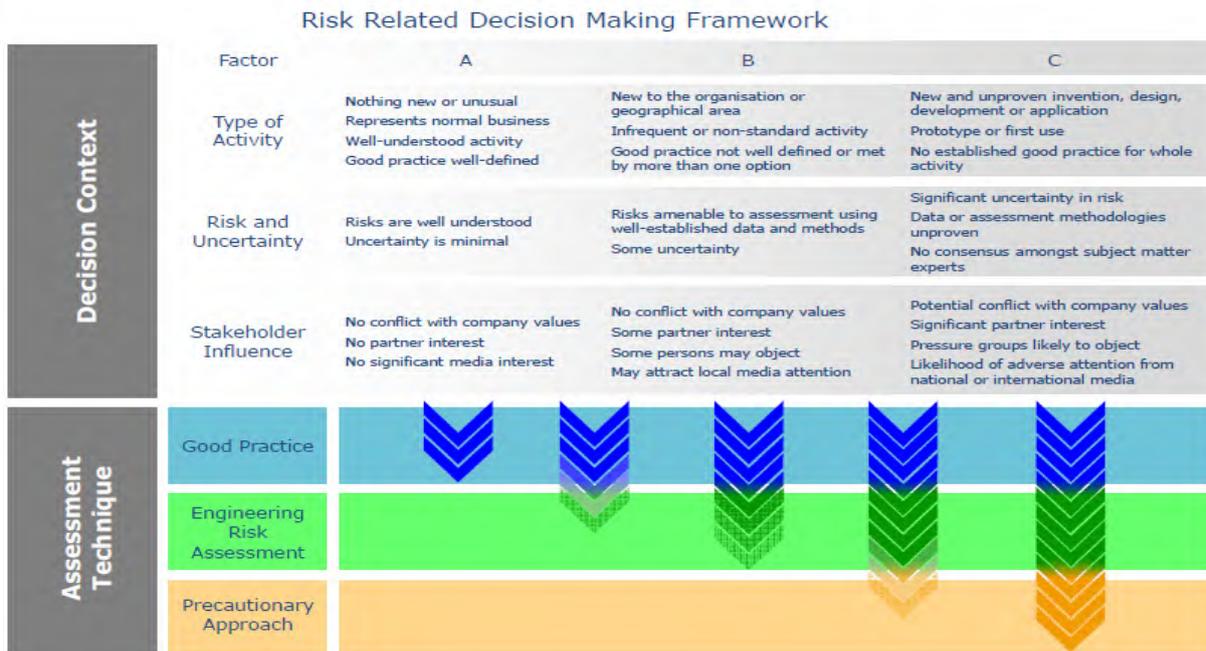

Figure 2-3: Risk related decision-making framework (Oil and Gas UK, 2014)

Decision Type A

Risks classified as a Decision Type A are well understood and established practice, they generally consider recognised good industry practice which is often embodied in legislation, codes and standards and use professional judgement.

Decision Type B

Risks classified as Decision Type B typically involve greater uncertainty and complexity (and can include potential higher order impacts/risks). These risks may deviate from established practice or

have some lifecycle implications, and therefore require further engineering risk assessment to support the decision and ensure the risk is ALARP. Engineering risk assessment tools may include:

- risk-based tools such as cost based analysis or modelling
- consequence modelling
- reliability analysis
- company values.

Decision Type C

Risks classified as a Decision Type C typically have significant risks related to environmental performance. Such risks typically involve greater complexity and uncertainty; therefore, requiring adoption of the precautionary approach. The risks may result in significant environmental impact; significant project risk/exposure or may elicit negative stakeholder concerns. For these risks, in addition to Decision Type A and B tools, company and societal values need to be considered by undertaking broader internal and external stakeholder consultation as part of the risk assessment process.

2.3.4 Demonstration of ALARP

Descriptions have been provided below (Table 2-1) to articulate how Woodside demonstrates different risks, impacts and Decision Types identified within the EP are ALARP.

Table 2-1: Summary of Woodside’s criteria for ALARP demonstration

Risk	Impact	Decision Type
<i>Low and Moderate</i>	<i>Negligible, Slight, or Minor (D, E or F)</i>	A
Woodside demonstrates these Risks, Impacts and Decision Types are reduced to ALARP if: <ul style="list-style-type: none"> • controls identified meet legislative requirements, industry codes and standards, applicable company requirements and industry guidelines • further effort towards impact/risk reduction (beyond employing opportunistic measures) is not reasonably practicable without sacrifices grossly disproportionate to the benefit gained. 		
<i>High, Very High or Severe</i>	<i>Moderate and above (A, B or C)</i>	B and C
Woodside demonstrates these higher order Risks, Impacts and Decision Types are reduced to ALARP (where it can be demonstrated using good industry practice and risk-based analysis) that: <ul style="list-style-type: none"> • legislative requirements, applicable company requirements and industry codes and standards are met • societal concerns are accounted for • the alternative control measures are grossly disproportionate to the benefit gained. 		

2.3.5 Demonstration of acceptability

Acceptability of the Scarborough Project, including the Petroleum Activities Program described in this EP, was demonstrated in the Scarborough OPP (SA0006AF0000002, Rev 5) as required by Environment Regulation 5D (6). The EPOs set in the Scarborough OPP demonstrate that the environment impacts and risks of the project will be managed to an acceptable level.

The impacts and risks of Scarborough were determined to be acceptable in the Scarborough OPP through consideration of the following evaluation criteria (Scarborough OPP (SA0006AF0000002, Rev 5); Section 6.4.4):

- Principles of Ecologically Sustainable Development (ESD) as defined under Section 3A of the EPBC Act

decision-making processes should effectively integrate both long-term and short-term economic, environmental, social and equitable considerations;

if there are threats of serious or irreversible environmental damage, lack of full scientific certainty should not be used as a reason for postponing measures to prevent environmental degradation; the principle of inter-generational equity—that the present generation should ensure that the health, diversity and productivity of the environment is maintained or enhanced for the benefit of future generations; the conservation of biological diversity and ecological integrity should be a fundamental consideration in decision-making; improved valuation, pricing and incentive mechanisms should be promoted.

- internal context – the proposed impacts and risk levels are consistent with Woodside policies, procedures and standards
- external context – stakeholder expectations and feedback have been considered and the proposed activities do not have a significant impact on MNES including those with an Indigenous connection with, or traditional use in nearshore areas as defined in Section 4.9.1 consideration of the environment consequence and stakeholder acceptability
- other requirements – the proposed controls and impact and risk levels are consistent with national and international standards, laws, policies and Woodside Standards (including applicable plans for management and conservation advices, and significant impact guidelines for MNES)

In this EP Woodside has demonstrated that the level of acceptability determined in the Scarborough OPP has been met through the following criteria:

- Adoption of relevant Scarborough OPP EPOs and controls
- Adoption of EP specific controls where required
- Impact Significance Level / Risk Consequence levels for receptors are equal to or less than the significant impact level defined in the Scarborough OPP (SA0006AF0000002, Rev 5; Section 6.5; Table 6-3) and are therefore consistent with the EPOs and managed to an acceptable level of impact or risk, and
- Consideration of internal/external context and other requirements specific to this EP Petroleum Activities Program (including issues raised during EP Stakeholder Consultation).

A summary of the process as adopted is shown in Table 2-2.

Table 2-2: Summary of Woodside’s criteria for Acceptability for Scarborough EP’s

Risk	Impact	Decision Type
Low and Moderate	Negligible, Slight, or Minor (D, E or F)	A
Woodside demonstrates these Risks, Impacts and Decision Types are 'Broadly Acceptable' if they meet the EP criteria listed above in Section 2.3.4. Further effort towards risk reduction (beyond employing opportunistic measures) is not reasonably practicable without sacrifices grossly disproportionate to the benefit gained.		
High, Very High or Severe	Moderate and above (A, B or C)	B and C
Woodside demonstrates these higher order Risks, Impacts and Decision Types are 'Acceptable if ALARP' if they meet the EP criteria listed above in Section 2.3.4. In addition, these higher order risks, impacts and decision types are 'Acceptable if ALARP' if it can be demonstrated that the predicted levels of impact and/or residual risk, are managed to ALARP (as described in Section 6). For potential C or above consequence/impact levels where significant uncertainty exists in analysis of the risk or impact (such as, for predicted or potential high risk of significant environmental impacts, significant project risk/exposure, novel activities, lack of consensus on standards, and significant stakeholder concerns. (E.g. Decision Type C), defined acceptable levels and assessment of acceptability may be required to be conducted separately for key receptors.		

2.4 EPBC Act Assessment

To support the demonstration of acceptability, a separate assessment is undertaken across the following four legislative requirements incorporated into the EPBC Act.

2.4.1 Principles of ESD

As part of the demonstration of acceptability an assessment is undertaken to demonstrate that the EP is not inconsistent with relevant principles of ESD (refer Section 2.3.5).

2.4.2 MNES: Significant Impact Guidelines 1.1

A separate assessment is undertaken to determine if the potential impacts/risks of the activity trigger any relevant criteria listed in the MNES: Significant Impact Guidelines 1.1.

An action is likely to have a significant impact on a critically endangered or endangered species if there is a real chance or possibility that it will:

- lead to a long-term decrease in the size of a population
- reduce the area of occupancy of the species
- fragment an existing population into two or more populations
- adversely affect habitat critical to the survival of a species
- disrupt the breeding cycle of a population
- modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline
- result in invasive species that are harmful to a critically endangered or endangered species becoming established in the endangered or critically endangered species' habitat
- introduce disease that may cause the species to decline, or interfere with the recovery of the species.

An action is likely to have a significant impact on a vulnerable species if there is a real chance or possibility that it will:

- lead to a long-term decrease in the size of an important population of a species
- reduce the area of occupancy of an important population
- fragment an existing important population into two or more populations
- adversely affect habitat critical to the survival of a species
- disrupt the breeding cycle of an important population
- modify, destroy, remove or isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline
- result in invasive species that are harmful to a vulnerable species becoming established in the vulnerable species' habitat
- introduce disease that may cause the species to decline, or
- interfere substantially with the recovery of the species.

2.4.3 Recovery Plan and Threat Abatement Plan Assessment

A separate assessment is undertaken to demonstrate that the EP is not inconsistent with any relevant recovery plans or threat abatement plans (refer Section 1.9.4.1). The steps in this process are:

- identify relevant listed threatened species and ecological communities (Section 4.6)
- identify relevant recovery plans and threat abatement plans
- list all objectives and (where relevant) the action areas of these plans, and assess whether these objectives/action areas apply to government, the Titleholder, and the Petroleum Activities Program (Section 6.9.2)
- for those objectives/action areas applicable to the Petroleum Activities Program, identify the relevant actions of each plan, and evaluate whether impacts and risks resulting from the activity are clearly not inconsistent with that action (Section 6.9.2).

2.4.4 Australian Marine Parks

A separate assessment is undertaken to demonstrate that the EP is not inconsistent with the objectives of the relevant Marine Parks Management plan (refer Section 6.9). The steps in this process are:

- identify relevant Marine Parks and the associated Marine Management Plan and their objectives
- identify the Marine Management plan objectives and relevant values of each Marine Park
- for each of the values of the marine park evaluate whether impacts and risks resulting from the activity are clearly not inconsistent the objectives (Section 6.9.2).

2.5 Environmental Performance Objectives/Outcomes, Standards and Measurement Criteria

The OPGGS Environment Regulations define EPOs to mean: “a measurable level of performance required for the management of environmental aspects of an activity to ensure that environmental impacts and risks will be of an acceptable level”. As such, the process of defining an appropriate EPO, has relied on the required levels of performance set either in legislation (such as the OPGGS Act), regulator guidance notes such as the Matters of National Environmental Significance–Significant Impact Guidelines (DotE, 2013) or may be the result of specific agreements or expectations with other relevant persons (e.g. fishers or other marine users).

EPOs for the Scarborough Project have been set within the Scarborough OPP (SA0006AF0000002, Rev 5) and assessed as meeting the requirements of the Regulations to be appropriate, consistent with the principles of ecologically sustainable development and to demonstrate that the environmental impacts and risks of the project will be managed to an acceptable level.

Environment Plans for petroleum activities submitted subsequent to the Scarborough OPP process are required to contain EPOs that are appropriate by being consistent with those set out in the Scarborough OPP. The EPOs presented in a subsequent EP are not required to be exactly the same however should achieve the same environmental outcome (or better) as that described in the Scarborough OPP. Activity specific EPs will also be required to contain measurement criteria and performance monitoring, auditing and reporting processes relating to the EPOs.

Table 6-2 shows a comparison between EPOs in the Scarborough OPP (SA0006AF0000002, Rev 5) and this EP.

3 DESCRIPTION OF THE ACTIVITY

3.1 Overview

This section has been prepared in accordance with Regulation 13(1) of the Environment Regulations and describes the activities to be undertaken as part of the Petroleum Activities Program under this EP. It includes the location of the activities, general details of the layout of the trunkline and seabed intervention activities, operational details and additional information relevant to considering environmental risks and impacts.

3.2 Project Overview

Woodside proposes to undertake seabed intervention and trunkline installation activities along the Scarborough trunkline route. The trunkline route is approximately 435 km from the Pluto LNG onshore facility to the pipeline end termination (PLET), of which about 400 km are in Commonwealth waters. This Environment Plan covers the section of the trunkline in Commonwealth waters from the State waters boundary to the PLET. All references to trunkline hereafter refer to this section of the trunkline. Specific locations along the trunkline are referred to as Kilometre Points (KPs) throughout this EP. These references are indicative until final KPs are determined after Trunkline installation.

Seabed intervention activities include surveys, seabed preparation for installation of the trunkline in the form of trenching, excavation and construction of infrastructure crossing rock berms; and post trunkline installation stabilisation activities. These include trench backfill and rock berm construction over the installed trunkline as well as any pre- and post-lay span supports.

Trunkline installation activities include pre and post installation surveys of the trunkline route, trunkline lay over multiple other operator pipelines and fibre optic cables, in-line installation of a 32"/36" reducer and 32" in-line tee near the Pluto Platform, installation of hot tap tees (after continental slope crossing), installation of the PLET and ancillary structures adjacent to the FPU location. Trunkline pre-commissioning activities include dry-commissioning with nitrogen and contingency for flood, clean, gauge and hydrotest (FCGT).

An overview of the Petroleum Activities Program is provided in Table 3-1.

Table 3-1: Petroleum Activities Program Overview

Item	Description
Permit Area	WA-32-PL
Location	Carnarvon Basin, North-West Australia
Water depth	Approximately 31 m (trunkline route at State waters boundary) to 1400 m (deepest point at KP 275 of the trunkline route)
Seabed Intervention	
Key Vessels	<ul style="list-style-type: none"> • Trailing suction hopper dredge (TSHD) • Offshore construction vessel (OCV)/ deep water excavation • Rock installation vessel (RIV) • Survey vessels • Support vessels • Fuel bunkering vessels

Item	Description
Key activities	<ul style="list-style-type: none"> • Surveys: • Geophysical (including hydrographic surveys) • Geotechnical • Pre-, progress and post construction survey (visual and multibeam echo sounder) • Trenching along the trunkline route and material disposal at existing Spoil Ground 5A • Borrow ground dredging and backfill along the trunkline • Continental slope crossing seabed preparation • Trunkline and infrastructure crossing supports installation, using rock and mattresses • Trunkline pre- and post-lay span rectification • Contingent seabed intervention activities including maintenance dredging/excavation of resettled material in the trench prior to pipelay, post lay dredging, grout bags and rock placement
Trunkline Installation	
Key Vessels	<ul style="list-style-type: none"> • Pipelay Vessel (PV) • Shallow Water Lay Barge (SWLB) • Anchor handling vessel/tug • Pipe supply vessels • Offshore construction vessel (OCV) • Survey vessels • Fuel bunkering vessels
Key activities	<ul style="list-style-type: none"> • Surveys: <ul style="list-style-type: none"> – Pre-lay survey of the trunkline route prior to commencement of pipelay (visual & multibeam echo sounder) – Post-lay as-built survey of the completed trunkline (visual and multibeam echo sounder) • Installation of the trunkline by a SWLB in the shallow water section of the route where the DP PV may not be able to access due to water depth restrictions. • Setting of SWLB anchors with anchor handling vessel/tug. • Installation of the trunkline by the PV including over other resource operator pipelines. • Installation of PLET and in-line tee assembly, hot tap tee assembly and ancillary structures as required through design by the PV. • Continuous delivery of pipe to the SWLB and PV by pipe supply vessels. • Installation of the foundations for the PLET structure by a construction vessel prior to the installation of the PLET. • Dry pre-commissioning of the trunkline by a construction vessel. • Contingent activities including wet buckle recovery and FCGT.

3.3 Concordance with the Scarborough OPP

The Scarborough OPP describes the scope of the project and its component activities, at a level comprehensive enough to facilitate thorough evaluation of environmental impacts and risks and appropriate setting of EPOs. However, in accordance with NOPSEMA guidance, it is acknowledged that an OPP is prepared at an early stage in project development, before detailed planning of component activities has occurred. More detailed descriptions of the component activities are therefore expected in subsequent EPs.

Refinement or modifications to methods or timing for individual project activities may occur after an OPP acceptance and before the submission of EPs. These refinements or modifications to the accepted project cannot be new activities and cannot significantly change the overall environmental impacts and risks of the project as described in the accepted OPP. Table 3-2 shows which scopes

from the Scarborough OPP may have progressed in level of definition from the time the Scarborough OPP was authored.

Section 4 of the Scarborough OPP (SA0006AF0000002, Rev 5) provides a detailed description of the Scarborough project.

Table 3-2: Concordance of activities described in the Scarborough OPP with those included in this EP

Scarborough OPP Section	Scope or overview of the Activity	Relevance to this EP	Refinement or modification to methods	Refinement or modification to timing	Is this a new activity	Significance of change
4.4.2.4 Trunkline	In the Scarborough OPP it is proposed that gas from the Scarborough fields will be exported from the FPU via a 32-inch carbon steel trunkline.	As trunkline engineering has progressed post Scarborough OPP acceptance, optimisation has resulted in a dual diameter design. This EP describes and assesses installation of a Trunkline with nominal 36" diameter from state waters boundary to approximately KP200 (offshore, approx. 194m water depth, before the Continental Slope crossing). From KP 200 to the FPU (approx. KP 433) the Trunkline remains nominal 32" diameter.	Yes	No	No	<p>This change does not significantly alter the overall environmental impacts and risks of the project as described in the accepted Scarborough OPP.</p> <p>The dual diameter Trunkline increases contingent hydrotest (FCGT) discharge volumes however risk assessment shows no significant change in environmental impact potential (Section 6.7.8).</p> <p>There is no increase in seabed disturbance from the larger diameter due to the relatively small absolute change (i.e., 2" increase in nominal diameter of Trunkline) (Section 6.7.3)</p> <p>There are no changes required to the emission estimates provided in the OPP (Section 7.1.3.2) as a result of the proposed change to the trunkline diameter.</p>
4.4.8 Pre-commissioning and Commissioning	While dry pre-commissioning is the base case for Trunkline pre-commissioning, the Scarborough OPP described and assessed the risks and impacts associated with hydrotest (FCGT). Potential volume of pre-commissioning discharges were estimated as 190,000 m ³ of chemically treated seawater with a 20% contingency, resulting in a	<p>Planning and design of the contingent FCGT activity has progressed since Scarborough OPP development and the FCGT pre-commissioning activity could occur as:</p> <ul style="list-style-type: none"> • Approx. 255,000 m³ discharge of Trunkline fluids at PLET. 		may be up to 1 km from the trench centre line.				levels rated in the Scarborough OPP.
Throughout	Different dates are proposed throughout the OPP for various project phases. For example Section 4.4.2.4 describes Trunkline construction as anticipated to begin in 2022.	Project timing (as detailed in Section 3.6 of this EP) has changed, for example Trunkline installation in Commonwealth Waters may commence Q4 2023. This is due to the 2020 delay in project progress.	No	Yes	No	<p>This change does not significantly alter the overall environmental impacts and risks of the project as described in the accepted Scarborough OPP.</p> <p>This EP assesses risks across the year, to accommodate changes in timing and ensure risks are managed to ALARP and acceptable levels whenever the activities may be carried out.</p>

3.4 Location

The Petroleum Activities Program is located in Commonwealth waters. Figure 3-1 shows the trunkline route, Spoil Ground 5A and the Offshore Borrow Ground.

Option selection for the trunkline route is described in Section 4.5.4.5 of the Scarborough OPP (SA0006AF0000002, Rev 5). The trunkline will run from the Pluto LNG onshore facility (Pluto Train 2) to the FPU at the Scarborough field. Within Commonwealth waters, the trunkline will extend from the existing Pluto offshore infrastructure to the FPU at KP 435. From Mermaid Sound to about KP 160, about 20 km south east of the platform, the trunkline will be routed adjacent to the existing Pluto trunkline. At KP 200, about 20 km north-west of the Pluto Riser Platform, the trunkline deviates to the south to avoid the existing facilities and manage environment, technical and safety risks.

The Offshore Borrow Ground within Commonwealth waters is approximately 17 km², located 20 km to the east of the proposed trunkline route and is adjacent to the Dampier Marine Park, although offset by a minimum of 250 m from the park boundaries.

3.5 Operational Area

The Operational Area defines the spatial boundary of the Petroleum Activities Program, as described, risk assessed and managed by this EP, including vessel related petroleum activities within the Operational Area.

For the purposes of this EP, the Operational Area includes the following Project Areas:

- Trunkline Project Area: The proposed trunkline from around KP 32 (Commonwealth – State Boundary) to KP 435 and 1.5 km either side of the proposed trunkline centreline which allows for the movement and positioning of vessels and includes Spoil Ground 5A.
- Offshore Borrow Ground Project Area: Offshore Borrow Ground located in Commonwealth waters.

This EP refers to the above areas as ‘Trunkline Project Area’ and ‘Offshore Borrow Ground Project Area’. Where the assessment in this EP relates to both these areas, collectively they are referred to as ‘Operational Area’. The Operational Area is shown in Figure 3-1.

Vessel-related activities within the Operational Area will comply with this EP. Vessels supporting the Petroleum Activities Program when outside the Operational Area must adhere to applicable maritime regulations and other requirements. This EP applies to activities undertaken within the Operational Area, as described in this section.

3.6 Timing

Subject to relevant approvals and other constraints such as vessel availability and weather, subsea intervention activities are expected to start in Q4 2023. Trunkline installation activities in Commonwealth waters are expected to commence Q4 2023 following successful completion of the State waters installation scope. The Petroleum Activities Program is estimated to be completed in 24 months with activities occurring in multiple campaigns.

Table 3-4 provides a breakdown of the estimated duration of planned seabed intervention and trunkline installation activities. The EP has risk assessed these activities throughout the year (all seasons) to provide operational flexibility for schedule changes and vessel availability.

When underway, activities will be 24 hours per day, seven days per week. The petroleum activities are sequential, for example, completion of pre-lay seabed intervention is required before trunkline installation. Concurrent operations (vessels in the same area at the same time) may occur and are detailed in Section 6.2.1 including potential current operations with the Scarborough D&C activities.

Timing, duration and vessel selection for all activities is subject to change due to project schedule requirements, vessel availability, unforeseen circumstances, and weather. Therefore, while the activities and estimated start date(s) / duration(s) are described in Table 3-4, activities may occur at any time over the life of the 5-year EP (until the end of 2027).

Table 3-4: Summary of Petroleum Activities Program timing

Activity	Earliest start & Estimated duration ¹	Vessel (typical) ²
Pre-lay Seabed Intervention		
Continental slope crossing seabed preparation	Q4 2023- 1 month	BOKA Falcon (OCV)
Pipeline and infrastructure crossing supports installation	Q4 2023 – 1-2 months	FPV Seahorse (RIV)
Pre-lay span rectifications (rock and/or mattress)	Q4 2023- 1 week	FPV Seahorse
Pre-lay trenching and spoil disposal	Q4 2023 - 2 months	TSHD Gateway
Trunkline Installation		

Activity	Earliest start & Estimated duration ¹	Vessel (typical) ²
Pre-lay survey of the trunkline route	Q4 2023 – 1 month	Survey vessel
Trunkline installation including in-line tee and PLET	Q4 2023 – 1 month Q4 2023 – 6 months Q1 2024 – 1 month	Saipem Endeavour (SWLB) Saipem Castorone (PV) Construction vessel for PLET foundation installation.
Dry pre-commissioning / wet pre-commissioning	Q2 2024 – 1- 3 month(s)	Construction vessel
Post-lay survey of the installed trunkline	Q2 2024 – 1 month	Survey vessel
Post-lay Seabed Intervention (incl. all progress surveys)		
Borrow ground dredging and backfill	Q4 2023 – 2-3 months	TSHD Gateway
Post-lay installation of rock for stabilisation and/or span rectification	Q1 2024 – 2-3 months	FPV Seahorse
Non-Production phase		
Trunkline preservation (IMMR)	2024 - 2026	Dependent on activity (Survey vessel, construction vessel)

¹ Does not account for operational delays and is an estimate of timeframes required for the activity

² Indicative vessels only, may be subject to change based on availability

3.7 Vessel Operations

Several vessel types will be required to complete the activities associated with the Petroleum Activities Program. These are detailed in Table 3-1.

Vessels may mobilise from an Australian port or directly from international waters to the Operational Area, in accordance with biosecurity and marine assurance requirements. Vessels will not usually anchor within the Operational Area during the activities and instead maintain position using DP.

DP uses multiple sources of positioning data (such as satellite navigation and radio transponders) to maintain the position of the vessel at a required location. In some instances, higher levels of accuracy may be required, where satellite information is enhanced via seabed transponders. These transponders emit signals that are detected by receivers on the vessel and used to calculate position. The transponders are typically deployed in an array on the seabed, using clump weights comprising concrete. They are recovered at the end, generally by ROV, and clump weights will also be recovered.

All vessels will display navigational lighting and external lighting, as required for safe operations. Lighting levels will be determined primarily by operational safety and navigational requirements under relevant legislation, specifically the *Navigation Act 2012*. The vessels will be lit to maintain operational safety on a 24-hour basis.

3.8 Support Operations

3.8.1 Refuelling

Vessels will be refuelled via support vessels as required and with a dedicated bunker vessel for the PV given its size. Refuelling may take place within the Operational Area and has been included in the risk assessment for this EP. For the SWLB and PV refuelling will take place within the Operational Area during continuous trunkline installation. Other fuel transfers that may occur on board vessels may include refuelling of cranes or other equipment as required.

3.8.2 Helicopter Operations

Helicopter activities are not planned for the Seabed Intervention scope, however there may be situations where crew changes may be performed using helicopters where vessels have a helideck. Helicopter operations within the Operational Area are limited to helicopter take-off and landing on the helideck.

For the trunkline installation scope helicopters will be used to transfer crew to and from the SWLB, PV and construction vessel on a regular basis, potentially up to six days per week. For vessel locations further along the trunkline route (i.e. past the nominal location of Pluto platform) the helicopters will be refuelled on the helideck. As such this activity will take place within the Operational Area and has been included in the risk assessment for this EP.

3.8.3 ROV Operations

The vessels may be equipped with a ROV system that is maintained and operated by specialised personnel aboard the vessel. ROVs may be used during activities including:

- Visual observations at seabed during activities (e.g., rock berm installation and continental slope preparation) and monitoring of the touchdown point of the trunkline on the seabed during trunkline installation.
- Pre and post lay surveys using an ROV, which can be fitted with various tools and camera systems.

3.8.4 Underwater Acoustic Positioning

Accurate positioning of mattresses, rock berms, the Trunkline and other structures on the seabed is required and therefore Ultra Short Baseline (USBL) and/or Long Base line (LBL) acoustic positioning may be required in some instances.

Typically, USBL subsea transponders are mounted on an ROV or structure which transmits an acoustic pulse back to the vessel receiver, hence providing an accurate position.

The LBL array provides accurate positioning by measuring ranges to three or more transponders deployed at known locations on the seabed and structures. These transponders will be recovered at the end of the petroleum activities. Alternatively, LBL transponders may be moored to the seabed by a clump weight which are recovered by means of a hydrostatic release. Clump weights will also be recovered.

Transmissions are not continuous but consist of short 'chirps' with a duration that ranges from 3 to 40 milliseconds. Transponders will not emit any sound when on standby. When required for general positioning they will emit one chirp every five seconds (estimated to be required for 4 hours at a time). When required for precise positioning they will emit one chirp every second (estimated to be required for 2 hours at a time).

3.9 Seabed Intervention Activities

3.9.1 Surveys

Survey activities may be carried out prior to the commencement of seabed intervention, during scope execution and after the activity is complete. Surveys may collect data to gather information on:

- bathymetry
- debris/obstacles
- pipeline and infrastructure (fibre optic cables etc.) crossings
- spoil ground and borrow ground conditions

- trunkline position.

The survey activities are undertaken either from a dedicated survey vessel or from the construction vessels themselves (RIV using its ROV for example).

The survey methods may include multibeam echo sounders (MBES), side scan sonar (SSS), pipe trackers, magneto meter and sub bottom profiler (SBP), and may utilise LBL or USBL for positioning. The survey methods used will be dependent on seabed soil conditions and required penetration and resolution. Some of the systems act as the transmitter and receiver; others have a separate transmitter and a short hydrophone streamer as a receiver.

MBES is used to undertake hydrographic surveys prior to, during and post trenching, material disposal and offshore borrow ground dredging activities. The purpose of the surveys is to establish seabed levels of the dredging areas, monitoring progress during dredging, material disposal and backfill.

MBES, like other sonar systems, transmit sound energy and analyse the return signal (echo) from the seafloor or other objects. The sound waves are transmitted from a transducer mounted on the hull of the survey vessel to produce a fan-shaped coverage of the seafloor. The coverage area on the seafloor depends on the equipment used, the settings of the equipment and the depth of the water.

SSS, pipe trackers and magneto meters may be used to verify positions of existing seabed features and infrastructure such as fibre optic cables, pipelines, umbilicals or seabed/subsurface obstacles.

Additional small-scale geotechnical surveys may be undertaken to support seabed preparation activities. Geotechnical surveys typically involve in-situ testing and piston/push sampling. Following sampling, all equipment is withdrawn from the seabed. A small hole (<1 m²) will remain, which will eventually collapse and infill with the movement of surface sediments in ocean current.

3.9.2 Vessel Operations

3.9.2.1 Trailing suction hopper dredge (TSHD)

Trenching, material disposal and sand backfill activities associated with the Petroleum Activities Program will be undertaken by trailing suction hopper dredge (TSHD). TSHDs are a self-propelled ship with a holding facility ('hopper') and are generally equipped with one or two suction pipes connected to drag head(s). The TSHD includes an overflow to discharge the redundant water overboard.

Typical TSHD vessel parameters are presented in Table 3-5.

Table 3-5: Typical TSHD vessel parameters

Parameter	Description – Example TSHD Gateway
Draft	10 m
Length	143.5 m
Carrying capacity	12,000 m ³
Total fuel volume	1590 m ³
Volume of largest fuel tank	287 m ³
Drag heads / suction pipes	Single

3.9.2.2 Rock Installation Vessel (RIV)

Installation of rock berms (Section 3.9.6.1) associated with the Petroleum Activities Program will use a dynamically positioned rock installation vessel. These vessels have the major equipment and systems of:

- flexible fall pipe and fall pipe ROV assisting with highly accurate rock placement (low rock wastage)
- fall pipe ROV with full video and multibeam echosounder capability
- large rock carrying capacity to ensure limited transfers to restock
- fully integrated production data monitoring systems ensuring efficient execution
- DP2 dynamic positioning station keeping capability and redundancy.

Typical RIV parameters are presented in Table 3-6.

Table 3-6: Typical rock installation vessel parameters

Parameter	Description - Example FPV Seahorse
Draft (max)	8 m
Length	162 m
Carrying capacity	17,500 t
Total fuel volume	3161 m ³
Volume of largest fuel tank	1270 m ³

3.9.2.3 Offshore Construction Vessels (OCVs)

Continental slope crossing seabed preparation (Section 3.9.5), span rectification (Section 3.10) and concrete mattress placement (Section 3.9.6.2) will be performed by a construction vessel under seabed intervention scope. Construction vessels will use DP and have a large heave compensated crane, work class ROVs and large flat back deck space to perform the works.

Typical construction vessel parameters are presented in Table 3-7.

Table 3-7: Typical construction vessel parameters

Parameter	Description – Example BOKA Falcon
Draft (max)	7.8 m
Length	93.4 m
Gross tonnage	6776 t
Crane capacity (AHC)	150 t @ 12 m
Total fuel volume	1,339 m ³
Volume of largest fuel tank	461 m ³

3.9.2.4 Support and other vessels

Other vessels used for the Seabed Intervention Activities include survey vessels, fuel bunkering and support vessels. These are smaller vessels than those detailed above.

Support vessels will be used to transport equipment and materials between the activity vessels and port (e.g., Dampier, Onslow). The loading and back-loading of equipment, materials and wastes is one of the most common supporting activities conducted. Loading and back-loading is undertaken using cranes on the vessels to lift materials in appropriate offshore rated containers (e.g., ISO tanks, skip bins, containers) between the activity vessel and support vessel. The support vessels, when in the Operational Area, are also available to assist in implementation of the Oil Pollution First Strike Plan, should an environmental incident occur (e.g., spills).

3.9.3 Trunkline Trenching (Dredging and Material Disposal)

It is anticipated that for the section of trunkline from shore to ~KP 50 in Commonwealth waters, there may be a requirement for some trenching (pre-lay) and back fill (post-lay) to stabilise the trunkline in both State and Commonwealth waters.

The pre-lay trenching works associated with the trunkline installation involves the dredging of an approximately 2–3.5 m deep trench, with an average width of approximately 30 m along the trunkline route, for up to ~18 km into Commonwealth waters, with detailed engineering being undertaken to minimise these intervention works as far as practicable. Trenching out to KP50 is considered a contingency only that has been impact and risk assessed under the EP. The planned trenching is only proposed to occur out to ~KP 39. Up to approximately 0.8 Mm³ of sediment will be required to be trenched in Commonwealth waters (in the case of trenching from KP 32 to KP 50) and approximately 0.4 Mm³ for the planned trenching, which has been reduced to KP 39.

A TSHD has been proposed for the pre-lay trenching works in Commonwealth waters. TSHDs are a self-propelled ship with a holding facility ('hopper') and are generally equipped with one or two suction pipes connected to drag head(s). Once near the trenching area the TSHD will be positioned along the centreline of the trench. The TSHD will then lower its trailing pipe and attached drag head to the seabed. The TSHD will sail slowly forward (typically 1-1.5 m/s) while dragging the drag head along the seabed. A jet system is typically used to assist with fluidising the seabed material whilst the drag head teeth provide some cutting/loosening influence. The dredge pumps hydraulically lift the mixture of solids and water up the suction pipe and into the hopper.

The loading of the TSHD will be optimised using overflow. Overflow is the release of predominantly water with some fine sediment and is used to maximise the quantity of sediment within the hopper and as such dredged material within each load. Overflowing generally starts once the sediment mixture reaches the top of the overflow weir in the hopper and would typically continue until the hopper is loaded to the dredging mark. Overflow will be discharged at the keel level rather than above water to reduce turbidity and dispersal of fine sediments.

The TSHD will place the dredged material in an approved spoil ground area in accordance with an approved Sea Dumping Permit (SD2019-3982). Spoil Ground 5A is the nominated spoil ground in Commonwealth waters, which lies within the Trunkline Project Area. Spoil Ground 5A is approximately 300 m wide and runs for about 18 km between the State waters boundary and a maximum of KP 50. Spoil Ground 5A has previously been used for spoil disposal from the Pluto Foundation trunkline. A total volume of up to approximately 0.8 Mm³ trenched material may be disposed of within Spoil Ground 5A.

3.9.4 Offshore Borrow Ground Dredging and Backfill

After the installation of the trunkline in the trench, backfilling with dredged material is required to help stabilise the trunkline. Up to ~2 Mm³ of this material will be sourced from the Offshore Borrow Ground, within Commonwealth waters for placement in both Commonwealth and State waters.

Up to approximately 0.9 Mm³ (in the case of backfill from KP 32 to KP 50) and approximately 0.4 Mm³ (for planned backfill from KP 32 to KP 39) of sandy sediments with a low proportion of fines will be required to help stabilise the trunkline in Commonwealth waters. Backfill material will be dredged using a TSHD in the same method presented in Section 3.9.3. Dredging within the Offshore Borrow Ground area (~17 km²) is planned to target areas with coarse sand where the sand thickness is largest. Dredging progress will be regularly surveyed with the aim to remove a layer thickness of less than approximately one metre (subject to technical constraints).

Backfill material obtained from the Offshore Borrow Ground will be placed over the trunkline via a drag head. The TSHD will reverse pump the sand backfill material from its hopper into the trench through a suction pipe, such that material is released close to the seabed. When backfilling the trunkline some trench overflow may be required to ensure the specifications for stabilisation are met.

Offshore Borrow Ground is the only borrow ground considered within Commonwealth waters (Figure 3-1) and is considered within the Petroleum Activities Program and the scope of this EP. Operations within this borrow ground will have a 250 m buffer from the boundary of the Dampier Marine Park.

3.9.5 Continental Slope Crossing Seabed Preparation

The trunkline along the continental slope requires seabed preparation to prevent excessive bending movements in the trunkline and associated free span lengths, where excavation will take place in water depths ranging between 550 m and 650 m. At about KP 209, seabed material, over a length of approximately 150 m within a 300 m corridor (excluding placement), will be excavated and/or displaced, which will allow appropriate pipeline span lengths.

The volume for excavation is dependent on trench depth and side slope angles. The design of the trench is significantly influenced by geotechnical properties and long-term stability requirements. The excavation volume is indicated as between 5000 and 15,000 m³.

The primary method of excavation is planned to be undertaken using an ROV controlled large volume grab. This system will be deployed from the construction vessel with an active heave compensated crane and lowered to the seabed. Several options for lateral movement of the excavated material are considered:

- use of a winch connected to a clump weight, offset from pipeline centreline
- use of a connected hose system to the grab, allowing a pump inside the grab to pump the mixture through the hose to a point above the bucket or to a designated placement area
- by vessel navigation moving the construction vessel between excavated area and adjacent material placement location for each grab cycle.

Selection of the most suitable, or combination of method(s) is subject to detailed engineering in context of the local soils and confirmation of a stable permanent side slope angle. Given the low strength of the local soil the creation of overburden on the top of the side slope is reviewed in significant detail. Typically, the seabed footprint for the disposal of excavated material is 100 m to 500 m from the trunkline centreline either side. In case of the free navigation of the construction vessel the choice of material placement location may be up to 1 km from the trench centre line.

Secondary options to achieve the excavation profile are methods such as: mass flow excavation, conventional ROV tooling and/or jetting to create the required trench. All the proposed methods will involve a level of fluidisation of the already very soft soils in the trench profile. This is unavoidable given the soil properties. A portion of the material excavated will end up dispersed in the water column with particles settling out away from the excavated area as a result of current and gravity, typically moving material down gradient.

3.9.6 Pipeline and Infrastructure Crossing Supports

The trunkline route crosses existing subsea infrastructure including pipelines, flexible flowlines, umbilicals and fibre optic cables, which will require this installation crossing supports on top of the existing seabed (Table 3-8). The design and specifications of the crossing supports are specific to each crossing. The options for possible crossing supports include rock berms (Section 3.9.6.1) and concrete mattresses (Section 3.9.6.2). Three infrastructure crossings lie within the Montebello Marine Park Multiple Use Zone (MUZ), with one crossing on the border (Figure 3-2).

Table 3-8: Commonwealth waters subsea infrastructure crossings

Crossing	KP	Water depth (m)	Method
Reindeer Pipeline (Santos)	75	~ 51 m	Rock
Fibre Optic Cable 1 (Telstra)	136	~71 m	Rock
Fibre Optic Cable 2 (Telstra)	150	~ 75 m	Rock

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Crossing	KP	Water depth (m)	Method
Wheatstone Pipeline (Chevron)	190	~ 121 m	Rock
Julimar Brunello Pipeline	192	~ 135 m	Rock
Pluto Pipeline	194	~ 150 m	Rock
Pyxis Pipeline	212	~1005 m	Mattresses

3.9.6.1 Rock Berms

Crossing supports may use rock berms upon which the trunkline is subsequently installed, to clear the existing infrastructure. The rock berms at the beginning and end of each crossing will contain rock cover over the top of trunkline to avoid future erosion of the touch down point of the trunkline. The rocks will be placed on the seabed in a controlled manner using a dynamically positioned RIV.

Two fibre optic cables are crossed needing a single rock approximately 0.7 m high rock pad on each side of the existing cable. The Wheatstone trunkline is the largest diameter to cross with two pre-lay berms on either side to reach the required safe separation height. Multiple small berms are needed to span over the four lines comprising the Julimar and Pluto systems.

A test dump may be carried out prior to crossing support installation, to ensure rock placement equipment configuration. This would be carried out within the Trunkline Project Area in a location free from existing infrastructure and not within the direct line of the trunkline route.

The direct disturbance footprint will be determined by the length, number and height of the rock berms. Seabed disturbance associated with the rock berms will typically be within the 30 m average disturbance corridor for the trunkline installation activities, however some settling of material may occur wider than 30 m and the corridor may extend slightly further for the centre of the berm.

Pre-lay supports to control acceptable trunkline spanning require the design to consider maximum allowable span lengths, working out whether one or multiple supports are required. Seabed bathymetry is a key input to assess to most appropriate locations for the supports. Where the span height is minimal, concrete mattresses may be used (Section 3.9.6.2).

A dynamically positioned RIV will be used to install the rock on the seabed. The fall pipe consists of multiple pipe sections, allowing it to be adjusted for water depth. The rock is transported from the hoppers along conveyor belts to the fall pipe and a feeder is used to control the installation rate. The fall pipe guides the material to the seabed and an ROV located at the base of the fall pipe allows for positioning.

Rock may be sourced locally and/or internationally.

3.9.6.2 Concrete Mattresses

Some crossing and span supports may consist of concrete mattresses, likely in areas of soft sediments. The Pyxis crossing supports will consist of concrete mattresses, as the seabed is in an area of soft sediments. Concrete mattress will be installed in close proximity on either side of the existing subsea infrastructure. The concrete mattresses are approximately 8 m x 3 m. To ensure the correct height is achieved, the design allows for a layering of multiple mattresses to create sufficient bearing capacity. The concrete mattresses will be installed from a DP construction vessel. The vessel's crane will be used to lift the concrete mattress from the deck of the vessel and then lowered to the seabed. An ROV will be used during installation to assist in accurate placement and positioning on the seabed.

3.10 Span Rectification

The trunkline route has been engineered to reduce the requirement for span rectification. Currently, it is anticipated that only one location will require pre-lay span correction; however, further design and the pre-lay survey will confirm the final number of pre-lay span corrections required. Following installation of the trunkline, additional locations requiring span rectification may be identified.

The options for possible span correction (pre and post lay) and scour mitigation include concrete mattresses (typically 6 or 8 m x 3 m) (Section 3.9.6.2), grout bags (typically 200 kg to 2000 kg) (Section 3.10.1), rock installation (Section 3.9.6.1), seabed levelling and excavation (e.g. dredging using TSHD, mass flow excavators and jetting) (Section 3.13.7).

3.10.1 Grout Bags

Grout bags are typically used to correct spans after trunkline installation. This process typically involves placing grout bags under the span section. The empty bag is moved into position using ROV, then filled with grout supplied from a mixing and pumping spread on the construction vessel via a downline. Small, prefilled bags can be installed using ROV or lowered to the seabed using a vessel crane. Following installation activities, concrete lines and equipment may be flushed clean, with wash-water discharged overboard.

Typical grout volumes depend on the size of the span and may vary in weight from about 200 kg to 2000 kg per span.

3.11 Trunkline Installation Activities

3.11.1 Surveys

Survey activities may be carried out prior to the commencement of trunkline installation (pre-lay), during scope execution (touchdown monitoring) and after trunkline installation has occurred (post-lay). Surveys may collect data to gather information on:

- bathymetry
- debris/obstacles
- pipeline and infrastructure (fibre optic cables etc.) crossings that the trunkline will be installed over
- the finished trunkline position.

The survey activities are undertaken either from a dedicated survey vessel or from installation vessels themselves, using the ROV stationed onboard these vessels.

A pre-lay survey of the trunkline will be undertaken prior to commencement of installation. This survey is aimed at identifying debris and other hazards prior to laying the trunkline and is not considered a full geophysical/geotechnical survey.

The survey usually utilises a SSS fish towed behind the pre-lay survey vessel. The survey methods are non-intrusive and the equipment, under planned operation, will not disturb the seabed. Information is transferred to the survey vessel via an umbilical. The pre-lay survey may also be undertaken with ROV or Autonomous Underwater Vehicle (AUV) using SSS.

An unexploded ordinance survey (UXO) may also be performed by the survey vessel at this time to confirm the trunkline route is free of any historic ordinances.

An MBES, a common survey tool for offshore surveys, may also be deployed to establish the profile of the seabed, using sound pulses.

Touchdown monitoring survey will be performed throughout the duration of the trunkline installation to regularly confirm that the trunkline is being installed to the design tolerances. This will be

performed by visual inspection from ROVs from either the SWLB or PV, or a dedicated survey vessel for the deep-water sections of the trunkline.

An as-laid survey will be performed after installation of the trunkline to inform the design of the backfill and post-lay rock dumping profiles and confirm the trunkline has been correctly installed prior to the commencement of pre-commissioning. These surveys will gather data on the position of the trunkline and the need for any additional span rectification.

An as-built survey will be performed on the fully completed trunkline post pre-commissioning to provide the baseline as-left condition of the trunkline, and identify any variance from the as-laid survey which may result from movement during the pre-commissioning process (in the case of wet pre-commissioning). Surveys will use a combination of MBES and ROV visual inspection to cover the full length of the completed trunkline.

Depending on pre-commissioning methodology (wet or dry) the as-laid survey may be used for as-built purposes, as minimal Trunkline movement occurs during dry pre-commissioning. For operational purposes either the as-laid or as-built survey will be input into the Woodside database to form the baseline for inspection surveys and maintenance planning into operations. The scope of these surveys includes the Trunkline, all in-line structures, pre-lay structures and span rectification.

3.11.2 Vessel Operations

3.11.2.1 Shallow Water Lay Barge

A Shallow Water Lay Barge (SWLB) will be required for the installation of the nearshore section of the trunkline, up to around the State waters boundary, however activities with this vessel may extend into Commonwealth waters. Typical specifications of a SWLB are provided in Table 3-9.

The SWLB will be positioned using up to ten anchors, and forward movement of the SWLB to lay the trunkline will be achieved by continually repositioning the anchors with anchor handling tugs. Anchors may be placed up to ~800 m either side of the SWLB. The SWLB position during operations will be closely monitored and existing infrastructure will be considered when assessing the barge anchor patterns.

Table 3-9: Specifications of a typical SWLB

Properties	Description – example Saipem Endeavour
Vessel length	143.3 m
Vessel width	42 m
Draft	Minimum 4 m / maximum 6.38 m
Number of tensioners	2 x 75 t
Maximum A/R winch tension	150 t
Volume of largest fuel tank	375 m ³

The SWLB will be assisted throughout pipelay operations by a spread nominally comprising of the following vessels:

- Two anchor handling tugs for mooring operations.
- Two shallow water tugs for mooring PV in very shallow water areas.
- Survey vessel for monitoring of the touchdown point of the trunkline.
- Two pipe supply vessels.

These vessels may move into Commonwealth waters (and work within the Operational Area covered under this EP) as they carry out activities close to the State waters boundary.

Anchor holding tests may be performed to ensure anchor requirements of the SWLB can be met. If an anchor is found to be dragging, the tension in the anchor wire will be released and remedial action in the form of redeployment and/or re-tensioning will be undertaken.

3.11.2.2 Pipelay Vessel

The Pipelay Vessel (PV) will install the trunkline in State and Commonwealth waters. The nominated vessel is the Saipem Castorone. Details of the PV are provided in Table 3-10. Installation will commence with recovery of the trunkline laid by the SWLB at around KP 31 (possibly out to about KP 33) in approximately 30 m water depth. The PV will maintain position during pipelaying operations using dynamic positioning.

The PV will be supported by a spread of pipe supply vessels, survey vessel and general supply vessels.

Table 3-10: Specifications of the PV

Properties	Description example - Castorone
Length	330 m (excluding ramp/stinger and helideck)
Width	39 m
Operational draft	Minimum 8 m, Maximum 10.6 m
Transit draft	8 m
S-lay stern ramp	120 m long hinged stinger
Number of tensioners	3 x 400 t
Maximum A/R winch tension	1200 t
Volume of largest fuel tank	1683 m ³

3.11.2.3 Pipe Supply Vessel or DP Bulk Carrier

Pipe supply vessels or DP Bulk Carriers (in the case of the PV) will transport 12 m lengths of pipe from a mothership moored in State waters, to the SWLB and PV. DP Bulk Carriers are also known as B-types for this Petroleum Activities Program, and two are currently planned for use. These will cycle between the PV and the mothership and may be refuelled near the PV in-field. The B-type has a removable, automated, pipe-handling gantry crane and 5,700m² of total deck space.

Table 3-11: Specifications for a typical DP2 B-type

Parameter	Description example - Spliethoff DP2 B-type
Length	141.30 m
Width	24.50 m
Draft (open top)	7.85 m
Engines	5,300 kW Main Engine, 4 x 2,000 kW Auxiliary Engines
Fuel consumption	Service speed 15 mt/day or DP2 15-16 mt/day
Volume of largest fuel tank	250 m ³

3.11.2.4 Construction Vessel

A construction vessel is planned to be used to install the PLET foundation and perform pre-commissioning of the trunkline. The construction vessel will use DP and have a large heave compensated crane, work class ROVs and large flat back deck space to perform the works.

Typical construction vessel parameters are presented in Table 3-12.

Table 3-12: Typical construction vessel parameters

Parameter	Description
Draft (max)	7 m
Length	95 m
Gross tonnage	6000-7000 t
Fuel type	Marine diesel
Total fuel volume	1339 m ³
Volume of largest fuel tank	461 m ³

3.11.2.5 Support and Other Vessels

Other vessels used for the Petroleum Activities Program include survey vessels, anchor handling (for the SWLB), fuel bunkering and support vessels. These are smaller vessels than those detailed above.

Support vessels will be used to transport equipment and materials between the activity vessels and port (e.g., Dampier, Onslow). The loading and back-loading of equipment, materials (including hazardous materials such as helicopter fuel, welding gases and chemicals for field joint coating) and wastes is one of the most common supporting activities conducted. Loading and back-loading is undertaken using cranes on the vessels to lift materials in appropriate offshore rated containers (e.g., ISO tanks, skip bins, containers) between the activity vessel and support vessel. The support vessels, when in the Operational Area, are also available to assist in implementation of the Oil Pollution First Strike Plan, should an environmental incident occur (e.g., spills).

3.11.3 Trunkline Installation

The trunkline is dual diameter with the diameter between the state waters boundary and ~KP 200 (approximately adjacent to the Pluto platform) being 36” and the remainder of the trunkline to the FPU being 32” diameter for a total route length of approximately 400 km in Commonwealth waters.

The key routing drivers for the trunkline are:

- minimising environmental impact
- avoiding any identified geohazards
- finding an optimum route up the continental slope (1000 m to 300 m water depth) which minimises intervention requirements and long-term integrity issues
- minimising the number of third-party trunkline crossings.

The shallow water section of the trunkline will be installed by a SWLB due to the water depth being under 30 m deep, which prevents access by the PV. The SWLB will construct the trunkline by welding together nominal 12 m lengths of pipe in the SWLB’s firing line (a series of work stations where welders weld the pipes together) and laying them to the seabed over the “stinger”, which supports the trunkline as it transitions from the SWLB to the seabed. As the pipes are 12 m long the SWLB moves forward 12 m at a time as each pipe joint is welded into the trunkline. Depending on the handover point between the SWLB and the PV, the SWLB may need to lay into Commonwealth waters.

Most of the trunkline will be installed from the multi-joint PV suitable for the high productivity required for 400 km of pipelay, and capable of laying through the deepwater sections of the trunkline route. Like the SWLB, the PV allows for welding together nominally 12 m lengths of pipe, each new section being welded to the previous section to form the trunkline. To operate at high productivity, the PV includes three firing lines. In two parallel firing lines three 12 m pipes are welded together to form 36 m long triple joints. These triple joints are then transferred into the main firing line where they are

welded together to construct the trunkline. Upon completion of welding; inspections and repairs or amendments are carried out as required and field joint coating applied, before the pipe is laid over a “stinger” on the stern of the vessel, down to the seabed. A tensioning system, consisting of three tensioners, holds the trunkline in the PV and allows the trunkline to be laid at the desired rate while maintaining the required tension as each new pipe-section is welded into the trunkline and the vessel moves forward. The welding together of the 36 m long triple joints means the PV moves forwards 36 m at a time enabling it to install the trunkline three times faster than the SWLB.

3.11.3.1 Buoyancy Removal

The trunkline will be installed by the SWLB with buoyancy attached to the individual pipes close to the handover location to the PV. This installation aid is required to reduce the submerged weight of the trunkline as it is installed by the SWLB at ~30 m water depth.

Prior to recover of the trunkline by the PV, the buoyancy will need to be removed. This will be performed by a support vessel which will activate releases to release the buoyancy from the trunkline. The buoyancy will be tethered together to facilitate collection by the support vessel.

3.11.3.2 Pipe and Structure Delivery to the SWLB and PV

During installation of the trunkline, pipe will be continuously delivered to the SWLB and PV by pipe supply vessels or DP bulk carriers. These vessels will be loaded with pipe from traditional cargo vessels moored in State waters and deliver the pipe to the SWLB and PV in the field. These vessels use DP to keep station alongside the SWLB and PV as they lay. During this time the pipe onboard is transferred by lifts using the crane onboard the SWLB and PV, usually with two lengths of 12 m pipe being transferred at a time. Pipe is planned to be transferred daily, allowing for continuous welding and laying of the trunkline.

Fabricated structures such as abandonment and recovery heads and the in-line tee, will also be delivered to the SWLB and PV respectively during the installation campaign from pipe supply vessels or DP bulk carriers. Similar to pipe transfer, these vessels will use DP to keep station alongside the SWLB and PV while the structures are lifted across by the cranes on the SWLB and PV.

3.11.3.3 Laying in Trenches

During trunkline installation near the State waters boundary, the PV will install the trunkline within excavated trenches prepared by the Seabed Intervention scope. Following trunkline installation these trenches will be backfilled by the Seabed Intervention scope.

3.11.3.4 Laying over Existing Infrastructure

During trunkline installation the PV will install the trunkline over the pre-installed rock berms constructed by the Seabed Intervention scope. This will enable the trunkline to clear the existing infrastructure (pipelines and fibre optic cables) with the required vertical clearance.

3.11.3.5 Laying Down Continental Slope

During trunkline installation the PV will install the trunkline down the continental slope in the section excavated by the Seabed Intervention scope.

3.11.3.6 In-line Tee, Hot Tap Tees, ancillary structures

An in-line tee, the two hot tap tees, foundations and ancillary structures or installation aids may be installed by the PV - the structures are welded into the trunkline during the normal lay process. These structures may need to be worked on (intervention) at a later date, by a construction vessel. This may include but not be limited to operation of valves and diverless connector, removal of yokes and buoyancy and installation of scour mattresses.

3.11.4 PLET and foundations Installation

Prior to installation of the PLET by the PV, foundations to support the PLET will be installed by a construction vessel with a heave compensated crane and work class ROVs. The PLET structure is too large to install through the firing line of the PV. As such when the PV reaches the end of the trunkline route adjacent to the FPU location, it will lay down the trunkline in its normal pipelay mode (S-lay) to the seabed. In order to then install the PLET, the trunkline will be recovered by the PV vertically and hang off the side of the vessel in a purpose-built hang-off porch. Here the PLET structure will be lowered down vertically on top of the trunkline by a mechanical A-frame and welded to the trunkline. Following completion of the welding, NDE and field joint coating, the PLET (now connected to the trunkline) will be lifted out of the hang-off porch and lowered to the seabed by a winch system on the PV and landed on top of the pre-installed foundation.

Following installation of the PLET by the PV, the PLET may need to be worked on (intervention) by the construction vessel. This may include but not be limited to operation of valves and diverless connector, removal of yokes and buoyancy and installation of scour mattresses.

3.11.5 Trunkline Pre-commissioning

Pre-commissioning of the trunkline will be performed to prove the trunkline integrity. Pre-commissioning may be undertaken using one of the following methods:

- Dry pre-commissioning (base case)
- Flood Clean Gauge Test (FCGT) – Full Trunkline (contingent scenario)

If dry pre-commissioning is unsuccessful or the requirements for dry pre-commissioning cannot be met, FCGT may be required to be carried out. Dry pre-commissioning is the preferred option and is considered the base case for pre-commissioning. However, this EP also includes the option of wet pre-commissioning with the potential for hydrotest discharges in Commonwealth waters.

3.11.5.1 Dry Pre-commissioning (base case)

This is the basis for the project where the integrity of the Trunkline is proven via the quality control process used during design, manufacture, construction and installation. This includes consideration of activities such as coating of the pipe, transport to the field and installation where the welding Non-Destructive Examination (NDE) or testing (NDT) is a key deliverable. This method does not include hydrotesting (and any associated discharges); the Trunkline is installed dry and remains dry. At the completion of installation, the Trunkline is dried (of small volumes of condensation) and inerted with nitrogen. As a result, dry pre-commissioning results in no liquid discharge and a reduction in equipment and time.

Dry pre-commissioning is required to be approved by DMIRS and NOPSEMA in the Scarborough Export Trunkline Safety Case(s). Woodside will follow a DNV approved process to ensure integrity of the Trunkline through quality assurance / quality control processes during all phases of trunkline design, pipe manufacture, construction, coating, transport and installation. Therefore a decision regarding acceptability of dry pre-commissioning will be able to be made after the Trunkline has been fully installed and the dry commissioning process has been carried out. Woodside will need to show it has met all the requirements of the DNV approved plan for replacing wet-testing – if Woodside cannot satisfactorily demonstrate it has met all the requirements, wet pre-commissioning will have to be undertaken.

Dry pre-commissioning will be performed by the construction vessel at the PLET location. A down line from the construction vessel will be connected to the PLET and nitrogen will be flowed through the trunkline to shore to remove small volumes of condensation and then leave the trunkline in an inerted state. Nitrogen will be generated by a drying and inerting spread on the construction vessel which includes a Nitrogen Membrane Unit. To perform this scope the construction vessel ROVs will need to intervene on the PLET which may include the placement of work baskets on the seabed for storage of ROV tools.

3.11.5.2 Cleaning and Gauging Pigging

Cleaning and gauging pigging may be performed in support of the dry-commissioning philosophy. The purpose of cleaning and gauging is to remove contaminating substances such as mill scale, welding products, dust, dirt and salts, and to gauge the trunkline to locate and identify defects such as dents, debris or other internal restrictions prior to dry pre-commissioning. Cleaning and gauging will be performed using pigs propelled from the onshore temporary pig launcher with compressed air with a combination of freshwater slugs to clean the trunkline. Included in this pig train would be a calliper gauging pig that can gauge the dual diameter of the installed trunkline. This activity is only associated with dry pre-commissioning, and results in small discharges of treated water (the slugs between pigs, around 250 m³).

3.12 Non-production phase and IMMR

Following drying and inerting, the Trunkline will be left in a preserved state filled with Nitrogen, until commissioning and operations, when gas is introduced into the system. During this non-production phase, Inspection, Monitoring, Maintenance and Repair (IMMR) activities may be carried out, as required. Pressure will be monitored at the trunkline onshore head to confirm trunkline integrity. Baseline inspection will be conducted post-start-up of the Scarborough trunkline to establish baseline integrity.

3.13 Contingent Activities

3.13.1 Flood, Clean, Gauge, Test and Dewater

The traditional method for proving integrity involves conventional flooding, cleaning, gauge and hydrotesting (FCGT also known as wet testing or hydrotesting). This method would only be used in the event of dry pre-commissioning failure or inability to get Safety Case approval for the dry pre-commissioning process (as discussed in 3.11.5.1).

Pre-flooding of the Trunkline with treated seawater occurs, to help manage integrity of the FCGT flooding operation (pig speed and air ingress), and reduce the likelihood of a failed hydrotest. This volume is then discharged while the Trunkline is being flooded for the FCGT using pigs.

Cleaning and gauging pigs would then be run from an onshore temporary pig launcher connected to the shore head to an offshore pig receiver located in Commonwealth waters. Flooding and cleaning pigs would be propelled using filtered and chemically treated seawater using an onshore pumping spread. Flooding water would be supplied by a temporary water winning line installed to provide sea water to the onshore pumping spread.

Once flooded, the trunkline would be pressurised using positive displacement pumps from the onshore shore crossing location. Hydrotesting would then be performed to measure the pressure within the trunkline over an extended period of time. Following completion of the test, the trunkline would be depressurised from onshore and left filled with treated seawater.

Dewatering of the trunkline would be performed using pigs propelled by compressed air with a combination of freshwater slugs to desalinate the trunkline. The displaced hydrotest water will be discharged offshore through a valve arrangement at the end of the Trunkline. Drying and inerting would then be performed and the Trunkline would be left nitrogen filled until hot commissioning.

Activities at the discharge location will be performed with the construction vessel and may include, but not be limited to, intervention on the PLET (attachment of a pig receiver), which could release small volumes of monoethylene glycol (MEG) used to inert the cavity between the PLET valve and diverless connector, and placement of work baskets on the seabed for storage of ROV tools.

3.13.2 Wet Buckle Response

A wet buckle is an event that could occur during trunkline installation and is typically caused by a loss of station keeping of the SWLB or PV and results in the trunkline buckling at the touchdown

point on the seabed causing it to flood with seawater. To recover from this scenario the damaged section of the trunkline will need to be removed and the remaining good section of trunkline dewatered. It is necessary to carry out dewatering and repairs as soon as possible to minimize damage (corrosion) to the Trunkline internal lining. The decision-making process to carry out a wet buckle repair will include ensuring the cause of the buckle has been rectified (i.e. it is safe to commence recovery of the Trunkline).

The damaged section of trunkline will be cut from the remainder of the trunkline using equipment such as a diamond wire saw and moved out of the trunkline route. Using a contingency wet buckle spread, kept in place at the shore crossing location within the Pluto Gas Plant, the trunkline will first be flooded with seawater (treated or untreated, depending on wet buckle recovery philosophy) for preservation, and then dewatered from shore to offshore using a pig train, potentially separated by chemically treated fresh water (desalination) slugs. Upon completion of this activity, the trunkline is recovered to the PV and installation activities will continue. The damaged section of the trunkline will then be cut into recoverable lengths (nominally 12 m joints) and recovered by a construction vessel.

3.13.3 Trunkline Abandonment and Retrieval

The trunkline may need to be abandoned and recovered during the course of installation. This could be multiple times. Abandonment is typically required when the sea states exceed the approved limit for trunkline installation, or due to an issue with supply of pipe to the vessel, mechanical requirements or approaching cyclone. Abandonment is performed by welding an abandonment head to the trunkline, connected to the abandonment winch and then opening the tensioners and carefully lowering the trunkline to the seabed. Recovery is the reverse of this operation. Abandonment needs to be performed in a straight line, therefore if an abandonment occurs at a bend in the trunkline route, lay-down on the seabed may move outside of the original/expected trunkline footprint. It is important to note here that the catenary of trunkline to be abandoned to the seabed is nominally 2.5 times the water depth.

3.13.4 Retrieval of Lost Buoyancy Tanks

The use of buoyancy tanks during pipelay activities will include redundancy so that loss of a certain number of buoyancy tanks can occur without compromising the operation. In the unlikely event of disconnection of a buoyancy tank, it will be recovered by a tug or support vessel.

3.13.5 Temporary Mooring of Trunkline Installation Vessel

The PV may be required to temporarily moor on location via its anchor, in the case of a contingency scenario. This would be done away from subsea assets to prevent damage. Under normal operations the vessel operates under DP.

3.13.6 Wet Parking Equipment

Equipment, materials or tools may need to be wet parked on the seabed in the Operational Area during installation of the trunkline. This could include, but not be limited to, work baskets for ROV tools, pig launcher/receiver prior/after connection to the PLET, scour mattresses etc. Any wet parked items will be removed from the seabed.

3.13.7 Jetting and Mass Flow Excavation

Jetting and/or mass flow excavation may be used during the trunkline installation for span rectification. These activities would be performed from a construction vessel.

3.13.8 Pre-lay Removal of Obstructions

In the event the pre-lay survey of the trunkline route identifies any obstructions that may impact the trunkline installation, these obstructions will need to be removed. This will be performed by a construction vessel using ROVs and heave compensated crane.

3.13.9 Dead Man Anchor pipelay initiation

In the remote event that the nearshore section of the trunkline in State waters is not installed prior to the arrival of the PV, a Dead Man Anchor (DMA) will be used to initiate trunkline installation. This involves setting the DMA on the trunkline route with a long pennant wire connected to the first pipe of the trunkline in the PV. The DMA is required to provide tension (by the PV pulling on the DMA wire) as the trunkline is laid to the seabed. After a sufficient length of the trunkline has been installed the DMA and associated pennant wire will be removed.

3.13.10 Maintenance of Trenches and Rock Berms

In case pre-lay trenches are silting up prior to pipelay (due to a storm/cyclone event, delays to pipelay or other causes) secondary dredging of settled material in trench may need to occur to reprofile the trench to design utilising the TSHD, with the associated dredged material placed in Spoil Ground 5A.

In the continental slope excavation area, reprofiling may also be required in case slumping/deterioration of the trench profile has occurred over time. It is anticipated that the same equipment would be deployed which carried out the original excavation activity, but depending on the nature and size of the work required a smaller locally available unit (Mass Flow Excavator [MFE], ROV tooling, etc) may be sufficient to carry out the work.

The infrastructure crossing rock berms are designed to withstand severe weather events. However, if in the unlikely case the berms do require rework, this would likely be executed with the RIV, adding some rock volume to reinstate berm height, width or slope angles.

3.13.11 Deburial

In case of faults (or suspected faults) found in the as-constructed trunkline in any section where the pipeline has been buried (after sand or rock placement), the burial material may need to be removed to allow inspection and possible repair of the suspect area. Methods considered for this work in Commonwealth waters are typically MFE, jetting, grab systems or (partial) re-dredging with the TSHD. Spoil would be deposited in the designated Spoil Ground 5A (in case of TSHD intervention) or remain close to the pipeline alignment (all other methods).

3.13.12 Remediation Work

Re-dredging or removing of misplaced sand backfill may be required in case spoil disposal occurred outside the spoil dump area or erroneous placement of rock material and it was decided in coordination with relevant stakeholders that additional intervention is the correct response. Remediation could take the form of application of an MFE attempting to move material away from the offending position, use of a grab system to relocate or re-dredging with the TSHD.

3.13.13 Hydrotest discharges for IMMR activities during non-production phase

If the trunkline is damaged while in preservation on the seabed following installation (and before the introduction of hydrocarbons), the trunkline may be exposed to raw seawater and/or repair may be required. In this case, integrity of the trunkline may need to be confirmed through traditional flood, cleaning, gauging and testing (FCGT). If FCGT is used for this purpose, discharges of treated seawater may occur at the location of the Trunkline resection and/or the Pipeline End Termination (PLET, ~KP433). Impacts are considered to be similar to those covered in Section 6.7.8 for wet buckle discharges. Trunkline repair will be carried out as per the *Woodside Pipeline Repair Strategy*, which covers aspects such as damage assessment, welding procedures, mechanical connectors / repair clamps etc.

4 DESCRIPTION OF THE EXISTING ENVIRONMENT

4.1 Overview

In accordance with Regulations 13(2) and 13(3) of the Environment Regulations, this section describes the existing environment that may be affected by the activity (planned and unplanned, as described in Section 3), including details of the relevant values and sensitivities of the environment, which were used for the risk assessment.

The Environment that May Be Affected (EMBA) is the largest spatial extent where unplanned events could have an environmental consequence on the surrounding environment. For this EP, the EMBA is the potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds, in the event of the worst-case credible spill derived from three key locations. The Hydrocarbon EMBA is also used to define the EMBA (Figure 4-1), which includes the dredging Zone of Influence (Section 6.7.2). The ecological impact thresholds used to delineate the EMBA are defined in Section 6.8.1. The worst-case credible spill scenario for this EP is loss of marine diesel during a vessel collision. The EMBA also includes any areas that are predicted to experience shoreline contact with hydrocarbons above threshold concentrations.

Woodside recognises that hydrocarbons may be visible beyond the EMBA at lower concentrations than the ecological impact thresholds defined in Section 6.8.1. These visible hydrocarbons are not expected to cause ecological impacts. In respect of this, an additional socio-cultural EMBA is defined, as the potential spatial extent within which social-cultural impacts may occur from changes to the visual amenity of the marine environment. Receptors relevant to the socio-cultural EMBA include Commonwealth and State marine protected areas (MPAs), National and Commonwealth Heritage Listed places, areas of tourism and recreation, and commercial and traditional fisheries. For this EP, the socio-cultural EMBA for surface hydrocarbons encompasses an area fully within the boundaries of the EMBA for ecological impacts. The EMBA and socio-economic EMBA are shown in Figure 4-1 and Figure 4-2 and described in Table 4-1.

The EMBA presented does not represent the predicted coverage of any one hydrocarbon spill or a depiction of a slick or plume at any particular point in time. Rather, the areas are a composite of a large number of theoretical paths, integrated over the full duration of the simulations under various metocean conditions, with release from three key locations.

This EP also refers to a Zone of Influence (Zoi) associated with seabed disturbance from seabed intervention and pipelay activities. The Zoi is defined in Section 6.7.2 and is located within the EMBA.

Table 4-1: Hydrocarbon spill thresholds used to define EMBA for surface and in-water hydrocarbons

Hydrocarbon Type	EMBA ¹	Socio-cultural EMBA ¹	Planning Area for Scientific Monitoring
Surface	10 g/m ² This represents the minimum oil thickness (0.01 mm) at which ecological impacts (e.g., to birds and marine mammals) are expected to occur.	1 g/m ² This represents a wider area where a visible sheen may be present on the surface and, therefore, the concentration at which socio-cultural impacts to the visual amenity of the marine environment may occur. However, it is below concentrations at which ecological impacts are expected to occur. This low exposure value also establishes the planning area for scientific monitoring (NOPSEMA guidance note: A652993, April 2019).	
Dissolved	50 ppb This represents potential toxic effects, particularly sublethal effects to highly sensitive species (NOPSEMA guidance note: A652993, April 2019). As dissolved hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors can be		10 ppb This low exposure value establishes the planning area for scientific monitoring (based on potential for exceedance of water quality triggers) (NOPSEMA guidance note: A652993,

Hydrocarbon Type	EMBA ¹	Socio-cultural EMBA ¹	Planning Area for Scientific Monitoring
	associated with ecological impacts. Therefore, dissolved hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		April 2019). This area is described further in Appendix D: Figure 5-1.
Entrained	100 ppb This represents potential toxic effects, particularly sublethal effects to highly sensitive species (NOPSEMA guidance note: A652993, April 2019). As entrained hydrocarbons are within the water column and not visible, impacts to socio-cultural receptors can be associated with ecological impacts. Therefore, entrained hydrocarbons at this threshold also represent the level at which socio-cultural impacts may occur.		In the event of a spill, DNP will be notified of AMPs which may be contacted by hydrocarbons at this threshold.
Shoreline	100 g/m ² This represents the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat.	10 g/m ² This represents the volume where hydrocarbons may be visible on the shoreline but is below concentrations at which ecological impacts are expected to occur.	N/A

¹ Further details including the source of the thresholds used to define the EMBA in this table are provided in Section 6.8.1.

4.2 Regional Context

The Operational Area is located in Commonwealth waters within the North-west Marine Bioregion (NWMR), as defined under the Integrated Marine and Coastal Regionalisation of Australia (IMCRA v4.0) (Commonwealth of Australia, 2006), in water depths of ~31 m (trunkline route at State waters boundary) to 1400 m (KP 275 of the trunkline route). The Operational Area overlaps a number of provincial bioregions within the NWMR; the Northwest Shelf Province (NWSP) and the Northwest Province (NWP). The Zone of Influence (ZoI) associated with dredging and pipelay activity is situated within the NWSP. The EMBA also overlaps the Northwest Transition (NWT), the Central Western Shelf Transition (CWST), and the Central Western Province (CWP) (Figure 4-3). Section 2.2 in Woodside’s Description of the Existing Environment in Appendix H and the Scarborough OPP summarise the key characteristics for these marine bioregions.

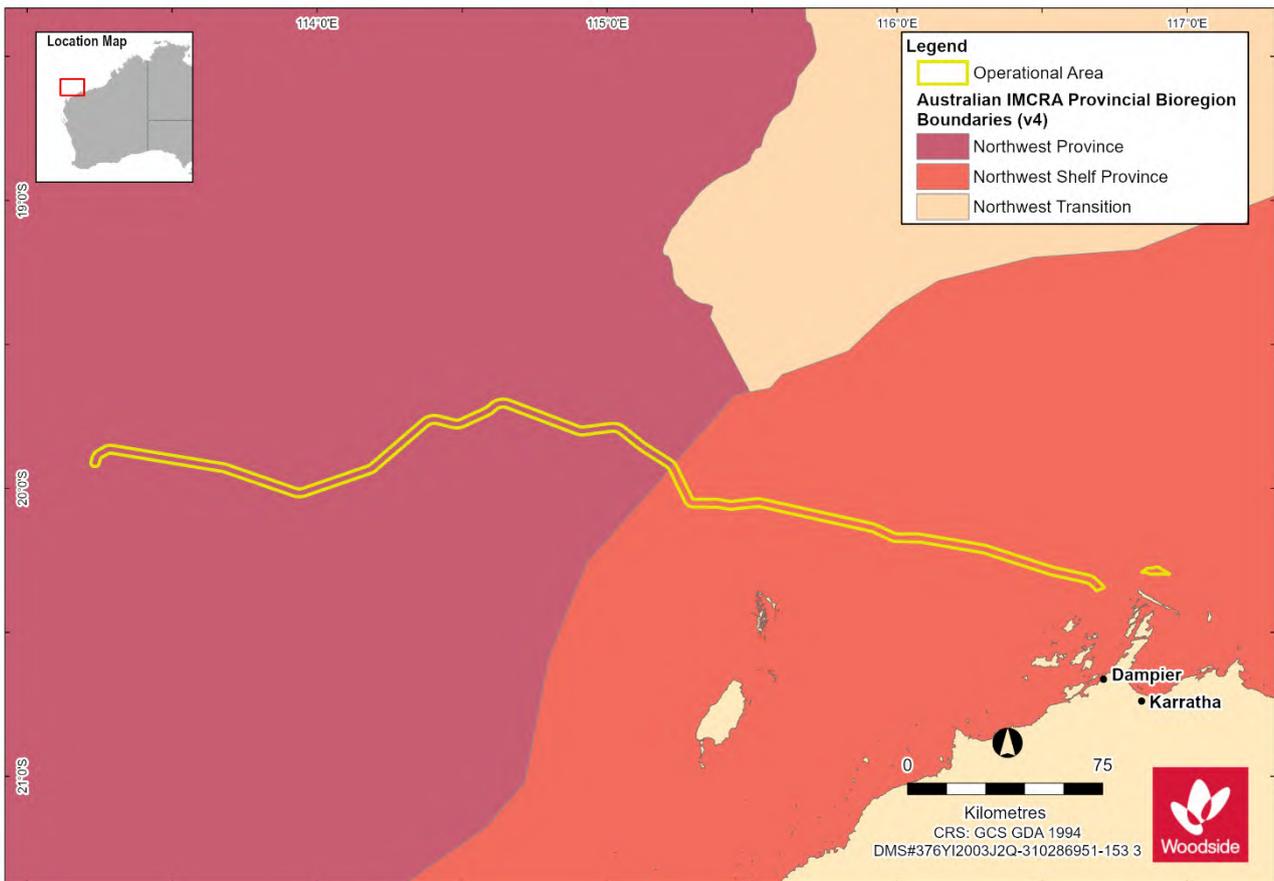

Figure 4-3: Location of the Operational Area and relevant marine bioregions

4.3 Matters of National Environmental Significance (EPBC ACT)

Table 4-2 and Table 4-3 summarise the matters of national environmental significance (MNES) overlapping the Operational Area and EMBA, respectively, according to Protected Matters Search Tool (PMST) results (Appendix C). It should be noted that the EPBC Act PMST is a general database that conservatively identifies areas in which protected species have the potential to occur.

Additional information on these MNES are provided in subsequent sections of this chapter and described in detail in Appendix H and the Scarborough OPP.

Table 4-2: Summary of MNES identified by the EPBC Act Protected Matters Search Tool (PMST) as potentially occurring within the Operational Area

MNES	Number	Relevant Section
World Heritage Areas	0	4.9.1
National Heritage Places	0	4.9.1

4.4 Physical Environment

4.4.1 Climate and meteorology

The Operational Area and wider EMBA are reflective of the climatic conditions of the NWMR, experiencing a monsoonal climate and maximum average air temperatures of 39.5°C in summer and 15.6°C in winter. Rainfall is highest during the wet season in late summer, and extremely low during winter (dry season). Seasonal wind patterns in the NWMR are dictated by atmospheric pressure, with prevailing winds from the north-west and south-west in the summer, and from the north-east and south-east in the winter. Tropical cyclone activity occurs between November to April, peaking between December and March. Appendix H and the Scarborough OPP provide a detailed description of the climate and meteorological conditions for the region (Table 2-3, Appendix H), and the Scarborough Area (Table 2-5, Appendix H).

4.4.2 Oceanography

The ocean temperatures in the NWMR are tropical year round, with sea surface temperatures reaching ~26°C (open shelf) and ~31°C (nearshore) in summer and ~22°C (open shelf) and ~17°C (nearshore) in winter. The NWMR is heavily influenced by major surface currents flowing poleward, including the Indonesian Throughflow (ITF), Leeuwin Current, South Equatorial Current, and the Eastern Gyral Current. Seasonal surface currents are also present in the region, including the Ningaloo Current, Holloway Current, Shark Bay Outflow and the Capes Current. Sub-surface currents flow towards the equator, including the Leeuwin Undercurrent and West Australian Current. Appendix H and the Scarborough OPP provide a detailed description of the oceanographic

conditions for the NWMR region (Table 2-3, Appendix H), and the Scarborough Area (Table 2-5, Appendix H).

4.4.3 Bathymetry, geomorphology and sedimentology

The geological history of the region has influenced the complex geomorphology and sedimentology of the NWMR. Water depths reach to 6000 m, however over 40% of the region features water depths of less than 200 m. The NWMR is described as an extensive area of shelf, slope, abyssal plain and deep ocean floor, with complex geomorphic features. These include plateaus, terraces, banks, canyons and a number of banks and reefs located on the outer shelf/slope. The continental shelf features sand and gravel sediments, that are replaced by mud and fine soft sediments on the continental slope. The abyssal plain is characterised by non-carbonate mud.

The bathymetry of the EMBA is characterised by continental shelf/slope, abyssal plain, canyons, terraces and reefs and sediments are representative of the wider region (Figure 4-4).

4.4.3.1 Trunkline Project Area

The Trunkline Project Area extends from the State-Commonwealth waters boundary on the inner continental shelf, onto the continental slope where it traverses the continental slope westwards to the Exmouth Plateau. The eastern half of the Trunkline Project Area is adjacent to the existing Pluto trunkline. The water depth ranges from ~31 m (trunkline route at State waters boundary) to 1400 m (KP 275 of the trunkline route).

Table 4-4 provides a summary description of the seabed along the trunkline route, including seabed features and along the trunkline route from the State waters boundary (KP 32) to the intersection of the trunkline route with the north-western limit of the Montebello Marine Park (approximately KP 191). Beyond KP 191 the seabed is located on the Exmouth Plateau, which is characterised by a thick Triassic sequence overlain by a Jurassic, Cretaceous and Cainozoic sediment sequence; and fine grained carbonate ooze (Fugro, 2010). Sediment samples collected at the end of the trunkline route were predominantly composed of clay and silt; and only small amounts (1–3% w/w) of sand and shell (ERM, 2013).

Table 4-4: Summary of seabed features, sediments, epifauna and infauna along the proposed trunkline route.

Section of Trunkline	Seabed features and sediments	Epifauna and infauna
KP 32 – KP 43.1	<ul style="list-style-type: none"> The seabed is predominantly flat, smooth and featureless Sediments comprise carbonate sands with some finer components. 	Sparse ascidians, sponges, invertebrate communities, burrowing organisms and octocorals were observed from the drop camera study. This benthos is considered representative of the area and is similar to that observed in other regional studies (Keesing, 2019; Advisian, 2019a).
KP 43.1 – KP 52.5	<ul style="list-style-type: none"> Seabed expected to comprise carbonate sand and shell gravel The seabed is predominantly flat and featureless between KP 43.1 and KP 52.5 Minor accumulations of coarser sediments between KP 43.9 and KP 44.9 and KP 47.1 to KP 50 KP 50 to KP 52 there are a number of isolated depressions visible on the seafloor. 	

Section of Trunkline	Seabed features and sediments	Epifauna and infauna
<p>KP 52.5 – KP 108.4</p>	<ul style="list-style-type: none"> Seabed sediments are expected to comprise carbonate sands with shell gravel Depressions appear throughout the route corridor it seems that the clusters of depressions mostly occur when the calcarenite is outcropping at seafloor. These depressions run perpendicular to the proposed trunkline route Geotechnical sampling within this section recovered carbonate sands with some silt content. 	<p>The predominantly featureless seabed is not expected to support abundant or diverse benthic communities and is considered typical of the North West Shelf.</p> <p>The presence of oil and gas infrastructure may artificially increase habitat complexity in areas of featureless seabed, resulting in higher species richness and abundance of fish species and epifauna associated with infrastructure, compared to adjacent natural habitats (McLean et al., 2020; McLean et al., 2018; McLean et al., 2017; Bond et al., 2018).</p>
<p>KP 108.4 – KP117.6 (Montebello Marine Park MUZ)</p>	<ul style="list-style-type: none"> Seabed sediments are expected to comprise carbonate sands with shell gravel which was confirmed by geotechnical sampling Localised increases in reflectivity tend to be associated with the presence of numerous depressions and exposure of the underlying calcarenite unit Shallow soils isopach occur along the corridor and tends to show a cover of sand which suggests that these areas are more likely to represent accumulations of coarse material or disturbed seabed rather than outcrop. 	<p>The results of previous benthic studies in the Montebello Marine Park are largely in alignment with the geophysical data (i.e. typically low relief sandy seafloor (with various bedforms) with occasional rubbly areas increasing at sites more inshore) and dominant benthic organisms identified (which varied in diversity and density within and between survey areas, but typically included a wide variety of sponges and soft corals including whips and gorgonians, hydroids, seapens and crinoids) (Advisian, 2019a).</p>
<p>KP 164.1, - KP 173.6 (Montebello Marine Park MUZ)</p>	<ul style="list-style-type: none"> Seabed sediments are expected to comprise carbonate sands with shell gravel The underlying calcarenite is expected to outcrop at seabed within the majority of this area, however, apart from appearing marginally less smooth and sometimes slightly mottled, the seafloor otherwise appears very uniform without any noticeable increase in reflectivity. 	<p>The harder areas of calcarenite have the potential to support more abundant and diverse benthic communities, however the patchiness of the exposure of the underlying hard substrate is expected to limit the potential to support significant epifaunal habitats.</p>
<p>KP 173.6 – KP 191.6 (Montebello Marine Park MUZ)</p>	<ul style="list-style-type: none"> Seabed appears moderately reflective and predominantly featureless. Isolated features and clusters are noted. These depressions often show associated small mounds Between KP 173.4 and KP 178.1 the seafloor appears more irregular and slightly mottled. Lineations in the calcarenite are oriented approximately north-east to south-west, and this area is thought to represent the outer reef which is characterised by linear ridges and relict sandwaves Relict sandwaves are present between KP 184.7 to KP 190.6. The sandwaves exhibit an approximate north-south orientation, have wavelengths of between 150 m to 300 m, and measure up to 10 m in height. Surficial seabed sediments are expected to comprise carbonate sands with shell gravel. 	

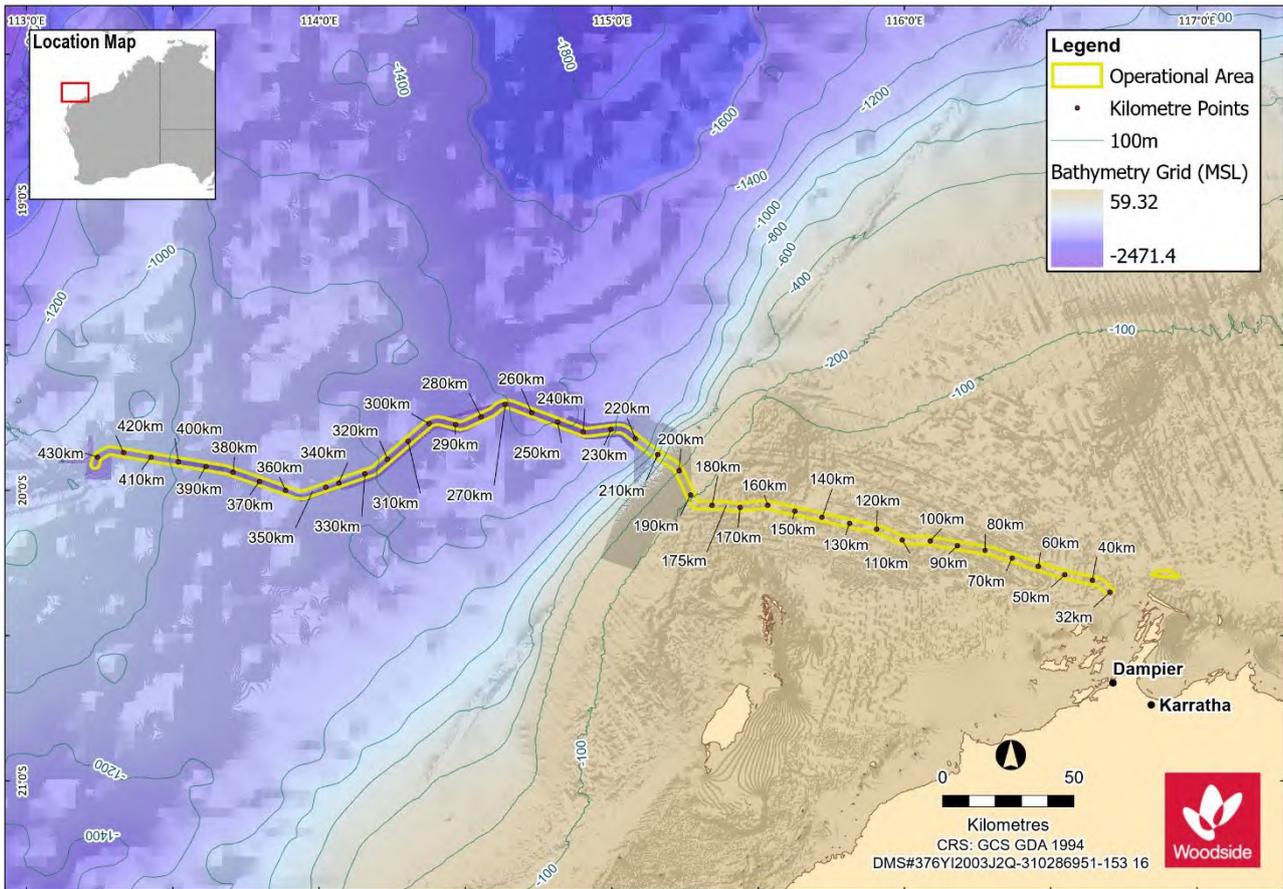

Figure 4-4: Bathymetry of the Operational Area

4.4.3.2 Offshore Borrow Ground Project Area

The Offshore Borrow Ground Project Area lies just outside the State waters boundary to the north-east of the Dampier Archipelago (about 15 km). Water depths in this area are shallow (~35-45 m), increasing gradually in a north to north-west direction. The Offshore Borrow Ground Project Area lies within the continental shelf and is characterised by a generally flat / undulating and uniform seabed.

Sub bottom profiler data shows a cover of superficial sand overlaying a variably cemented calcarenite unit. The depth of the superficial sand layer typically ranges between 1 m and 2 m across the borrow ground area. The seabed appears predominately flat, smooth, and featureless. Sand waves were observed at three locations across the borrow ground area exhibiting a northeast-southwest orientation displaying heights of <0.5 m with typical wavelengths of 5-10 m. Numerous ribbons features occur across the borrow ground area. These features occur predominantly in the northern half of the site and are oriented approximately northwest-southeast. They are expected to represent current aligned accumulations of coarser sediments. Both the sand wave and ribbon seabed features suggest that sediment transport of the superficial sand layer, is occurring in an approximate northwest-southeast or southeast-northwest direction (Neptune 2018).

Surveys have been completed at the Offshore Borrow Ground Project Area (Advisian, 2019b) to determine the suitability of the proposed area as a source of trunkline stabilisation material. Towed video and drop camera surveys of both the potential borrow ground and the Dampier Marine Park directly adjacent to the borrow ground, confirm that the seabed and its benthic composition are relatively uniform in structure and composition. Both locations are dominated by bare substrate with large areas of seabed that are apparently largely devoid of any epibenthic species.

Based on findings by Fugro (2019) from a geotechnical investigation, on average, the material within the offshore borrow ground consists of approximately 94% coarse sand (>130 µm), 3% fine sand (75-130 µm) and 3 % clay and silt (<75 µm). These percentages were derived from the boreholes and associated soil properties. As such, the PSD data for the offshore borrow ground can be characterised mainly as coarse sand with a low fines fraction, with coarseness and layer thickness increasing towards the eastern part of the borrow ground.

Appendix H and the Scarborough OPP provide a summary of the physical characteristics of the environment within the EMBA.

4.5 Habitats and Biological Communities

4.5.1 Primary Productivity

Primary productivity in the region is typically low, driven by offshore influences, with periodic upwelling and cyclonic events driving coastal productivity (Brewer et al., 2007). Localised upwelling generally occurs as a result of the changing strength of the ITF, internal tides, cyclones, and their interaction with the complex seafloor topography.

The planktonic communities that drive primary productivity in the region are comprised of phytoplankton and zooplankton (protozoa, copepods, ichthyoplankton etc.). Phytoplankton abundance increases as a result of an increase in nutrient availability, in turn supporting an increase in zooplankton. Mass coral spawning events in the NWMR during March and April contribute to peaks in zooplankton abundance.

The planktonic communities of the EMBA and Operational Area are likely to be representative of the wider region. Offshore planktonic communities feature smaller taxa, whereas inshore communities are dominated by larger taxa such as diatoms. The greatest productivity is likely to be around the 200 m isobath, associated with the shelf break. Further information regarding the planktonic communities of the Scarborough Area and the NWMR are detailed in Sections 4.2 and 4.3 of Appendix H and the Scarborough OPP.

4.5.2 Benthic Habitats and Communities

The NWMR is characterised by diverse nearshore primary producer habitats such as seagrass meadows, coral reefs and mangrove forests, to offshore soft sediment seabed habitats and submerged and emergent reef systems. Benthic communities range from infauna and low density sessile filter feeders of soft sediments and deeper waters, mobile macrobenthos and diverse hard coral communities in shallower habitats. Table 4-1 in Appendix H provides further details for the habitats and biological communities found within the NWMR.

The EMBA is likely representative of the wider region, featuring sparse mobile epifauna (i.e., arthropods and echinoderms) and sessile filter feeders (sponges, soft corals etc.). Hard coral assemblages are generally found in shallower waters (< 50 m) on the seaward slopes of outer islands of the Dampier Archipelago, as well as fringing reefs around the Montebello Islands, Barrow Island, Muiron Islands and Ningaloo Reef. Regionally significant Rankin Bank and Glomar Shoal (~25 km north-east and ~78 km north of the Trunkline Project Area, respectively), are present within the EMBA, hosting diverse benthic assemblages across complex seafloor features. Glomar Shoal is designated a (Key Ecological Feature (KEF) (Table 9-1, Appendix H). Seagrass meadows and benthic macroalgae reefs are located in shallow waters surrounding the Dampier Archipelago, Muiron and Barrow islands in sheltered areas and subtidal habitats (Table 4-1, Appendix H).

The benthic communities within the Operational Area are further summarised in Table 4-6. The Trunkline Project Area is likely to feature sparse ascidians, sponges, invertebrates, infauna and burrowing organisms and octocorals, representative of the area (Table 5-2, Appendix H). No primary producer communities (hard corals, seagrass, macroalgae) are expected to occur due to the lack of light.

Offshore Borrow Ground Project Area: The Offshore Borrow Ground Project Area is likely to feature little to no biota, with anemones and crinoids accounting for less than 5% cover. Where epibenthos is present, the percentage cover of species is comparatively low (in the order of 5%), with no transects recording greater than 10% coverage in the species present. Common species present were alcyonaceans (mainly solitary soft corals), pennatulaceans (sea pens), crinoids (feather stars), asteroids (sea stars) and hydroids. No benthic primary producer habitat in the form of hard corals, macroalgae or seagrass was recorded or observed along any of the survey transects.

The benthic habitat observed is consistent with a broad scale characterisation of the Pilbara seabed undertaken by UWA and CSIRO (Pitcher et al., 2016). Additional survey work completed by CSIRO shows benthic cover at the proposed offshore borrow ground and adjacent habitat protection zone is not regionally significant, and benthic cover is lower than that identified regionally (Keesing, 2019).

Spoil Ground 5A: Surveys of Spoil Ground 5A indicated sparse coverage of ascidians, sponges, invertebrate communities, octocorals and infauna, representative of the wider NWMR (Woodside, 2009). The spoil ground has previously been used for spoil disposal from the Pluto Foundation trunkline and is therefore a pre-disturbed area.

KP 32 to KP 50 (area of proposed seabed intervention): As part of the Pluto LNG Foundation Project, drop camera surveys were completed to determine the presence and extent of any sessile benthic assemblages adjacent to the proposed trunkline route (within 1 km). The survey was completed between the State waters boundary and to a point adjacent KP 50.3 (Woodside, 2009). The seabed was characterised as fine to coarse sand with low species abundance and diversity with sparse sponges and soft corals typical of habitat on the North West Shelf. Given the seabed substrate observed in the drop camera study aligns with the geophysical and geotechnical data collected along the trunkline route, benthic communities and habitats along the proposed trunkline route are expected to be similar to those observed in the drop camera study.

KP 50 to KP 109: Between KP 52.5 and KP 109 the seabed is generally featureless with the exception of some depressions noted from the geophysical data that appear to expose the underlying calcarenite and areas where the underlying calcarenite is intermittently exposed at the seabed. The areas of calcarenite are often overlain with a thin veneer of sediments which limits the spatial area of hard exposed substrate. Seabed sediments were confirmed from the geotechnical survey as comprising carbonate sands with some silt and shell gravel. The calcarenite outcrops generally run perpendicular to the trunkline and are spread widely over the North West Shelf (Wilson, 2013). Any intersections of the isolated calcarenite outcropping identified from the geophysical data represent a very small area ($<0.01\text{km}^2$), given the 32 inch diameter of the pipeline.

KP 109 and KP 192 (Montebello AMP): The trunkline route intersects the Montebello AMP between KP 109 and KP 191.7. The seabed along the South East corner of the Montebello Islands Marine Park between KP 109 and KP 145 is generally featureless with the exception of some depressions noted from the geophysical data that appear to expose the underlying calcarenite. From KP 117.7 some calcarenite outcrops intersect the trunkline route. Keesing (2019) showed that the topography in the vicinity of the Scarborough trunkline is predominantly flat bottom with some occasional bioturbated areas, and the substrate is typically fine sands. These sites within the vicinity of the Scarborough trunkline had low numbers of sponges, whips and gorgonians and as a result, complex benthic filter feeder communities were largely absent. From KP 145 to KP 192 the seabed starts off generally featureless with the exception of some small depressions. From approximately KP 173 the calcarenite exhibits subtle northeast-southwest oriented lineations observed in the bathymetry, but a veneer of sediment is thought to cover these outcrops. From approximately KP 185 relict sandwaves are observed from the geophysics data.

An ROV survey of the trunkline route within the Montebello AMP was undertaken in 2019 (Advisian 2019b). Video imagery was collected from between one and three transects from five separate sites along the trunkline route through the Montebello Marine Park. Area 1 was located in the vicinity of the ancient coastline KEF; and Areas 4 and 5 were in the vicinity of the existing Pluto trunkline. A summary of the benthic habitat analysis of ROV footage within the Montebello AMP is provided in

Table 4-5 and an example of ROV footage is shown in Figure 4-5. Section 5.6.1 of the Scarborough OPP further describes the results from the ROV survey. The area in which the trunkline intersects the North West section of the Montebello AMP was found to be characterised by bare sandy sediments, interspersed with predominantly sparse benthic communities and epifauna. Denser areas of sponges were observed in areas identified from the bathymetry as having a more complex seabed structure.

Table 4-5: Summary of benthic habitat analysis of ROV footage within the Montebello AMP

Survey Area	Summary
1	<ul style="list-style-type: none"> • Transect 1a was located within the KEF; Transects 1b and 1c were not. No potential features of the KEF (i.e. areas of hard substrate with high biodiversity) were seen along any of the transects surveyed. • Benthic habitat along all transects were typically bare sand with various bedforms including flat bare sand, small ripples (of 2D and 3D forms) and small 'steps' (<50 cm). • Some areas of seafloor were bare, while others were covered in a light bacterial mat and others were seen to have a cover of biogenic gravel (of unidentified origin). The cover of biogenic gravel changed continuously over the course of the transects. • No moderate or high relief features or areas of consolidated hard substrate were present within any transect. • Benthic organisms (including sponges and soft corals) were present on occasion and generally occurred as single or low density aggregations of individuals. The cover of benthic organisms in ranged from 0% to ~15% (highest in Transect 1c). • Bioturbation of the seafloor was evident in all three transects indicating the presence of mobile organisms living on and within the seabed. Mobile organisms including fish, echinoderms and jellies, were also noted on the video.
2	<ul style="list-style-type: none"> • The seafloor was relatively flat and sandy with a light to high cover of unconsolidated biogenic gravel and/or organic material. Small undulations of the seabed were seen but no other regular bedforms such as sand ripples or sand waves were apparent. • No significant high relief habitat features, or areas of consolidated hard substrate, were observed in any transect. • Some areas of seafloor were relatively bare while others included a low (~5%) to high (~80%) density cover of benthic organisms. This benthic cover changed continually and often (within m's) over each transect. Benthic fauna comprised a diverse array of sponges and corals with varying forms, sizes and colours. Hydroids and cnidarians were also apparent on occasion. • Bioturbation of the seafloor in the form of small cones, craters, burrows, small and large trails was also apparent. Mobile organisms including fish, echinoderms and jellies, were also noted on the videos.
3	<ul style="list-style-type: none"> • The seafloor in Area 3 was relatively flat and sandy with a light to high cover of biogenic gravel and/or organic material over its entire length (continually changing). Small undulations of the seabed and some small sand waves were present on occasion, but no other regular bedforms such as sand ripples or sand waves were apparent. • No significant moderate or high relief habitat features were observed on the video or can be seen on the transect maps with detailed bathymetry. Any features seen are in the order of ~1 m and occur over relatively large scales. • The seabed was a mosaic of bare substrate and low (~5%) to high (~75%) density cover of benthic organisms (e.g. sponges, corals). Benthic fauna comprised a diverse array of sponges and corals with varying forms, sizes and colours. Hydroids and cnidarians were also apparent on occasion along the transect length. • Bioturbation of the seafloor in the form of small cones, craters, burrows and small and large trails was apparent. Mobile organisms including fish, echinoderms and jellies, were also noted on the videos. Fish fauna diversity was quite high, and varying sizes of fish were seen amongst the aggregations of corals and sponges and also over bare sandy seafloor.

Survey Area	Summary
4	<ul style="list-style-type: none"> • The seafloor within Area 4 was typically flat sand with a high level of biogenic gravel of unknown origin. Small mounds, waves and undulations all < 50 cm in height were seen on occasion and mainly occurred around aggregations of benthic epifauna (i.e. sponges and corals). • No significant moderate or high relief features, or significant areas of consolidated hard substrate, were present in Area 4 as could be seen on the video or transect maps. • The seafloor in Area 4 was scattered with sponges and corals of varying forms and sizes; occurring as individuals with a low-density cover (~5%) up to more dense clusters (~50%). Other benthic epifauna included echinoderms (e.g. feather stars) and cnidaria (e.g. seapens). Mobile fauna (mainly small bony fishes) were most common around the larger clusters of sponges and corals. • Areas of bare sand were present amongst the patches of epifauna; and the switch between bare sand to benthic cover changed constantly and over short distances. • Bioturbation of the seafloor in the form of small mounds and craters was evident along the entire transect length.
5	<ul style="list-style-type: none"> • The seafloor consisted of flat sand, often with an organic cover (likely bacterial or algae) or a biogenic gravel component. The seafloor showed some slight undulation in places and scour marks commonly occurred around small 'clusters' of benthic epifauna (i.e. sponges and corals). No regular bedforms such as sand ripples or sand waves were present. • No significant moderate or high relief features were present. • Benthic epifauna occurred sporadically along the entire transect length and generally occurred as diverse 'clusters' of sponges and corals. These organisms were often large and were very diverse in form. The percentage cover of benthic organisms ranged from 5% to ~40%. • Mobile fauna were common around these clumps of sponges and corals; including echinoderms (e.g. sea stars, feather stars and sea cucumbers) and small bony fishes. • Bioturbation of the seafloor was common over the entire transect length and usually occurred in the form of thin trails, small mounds or craters.

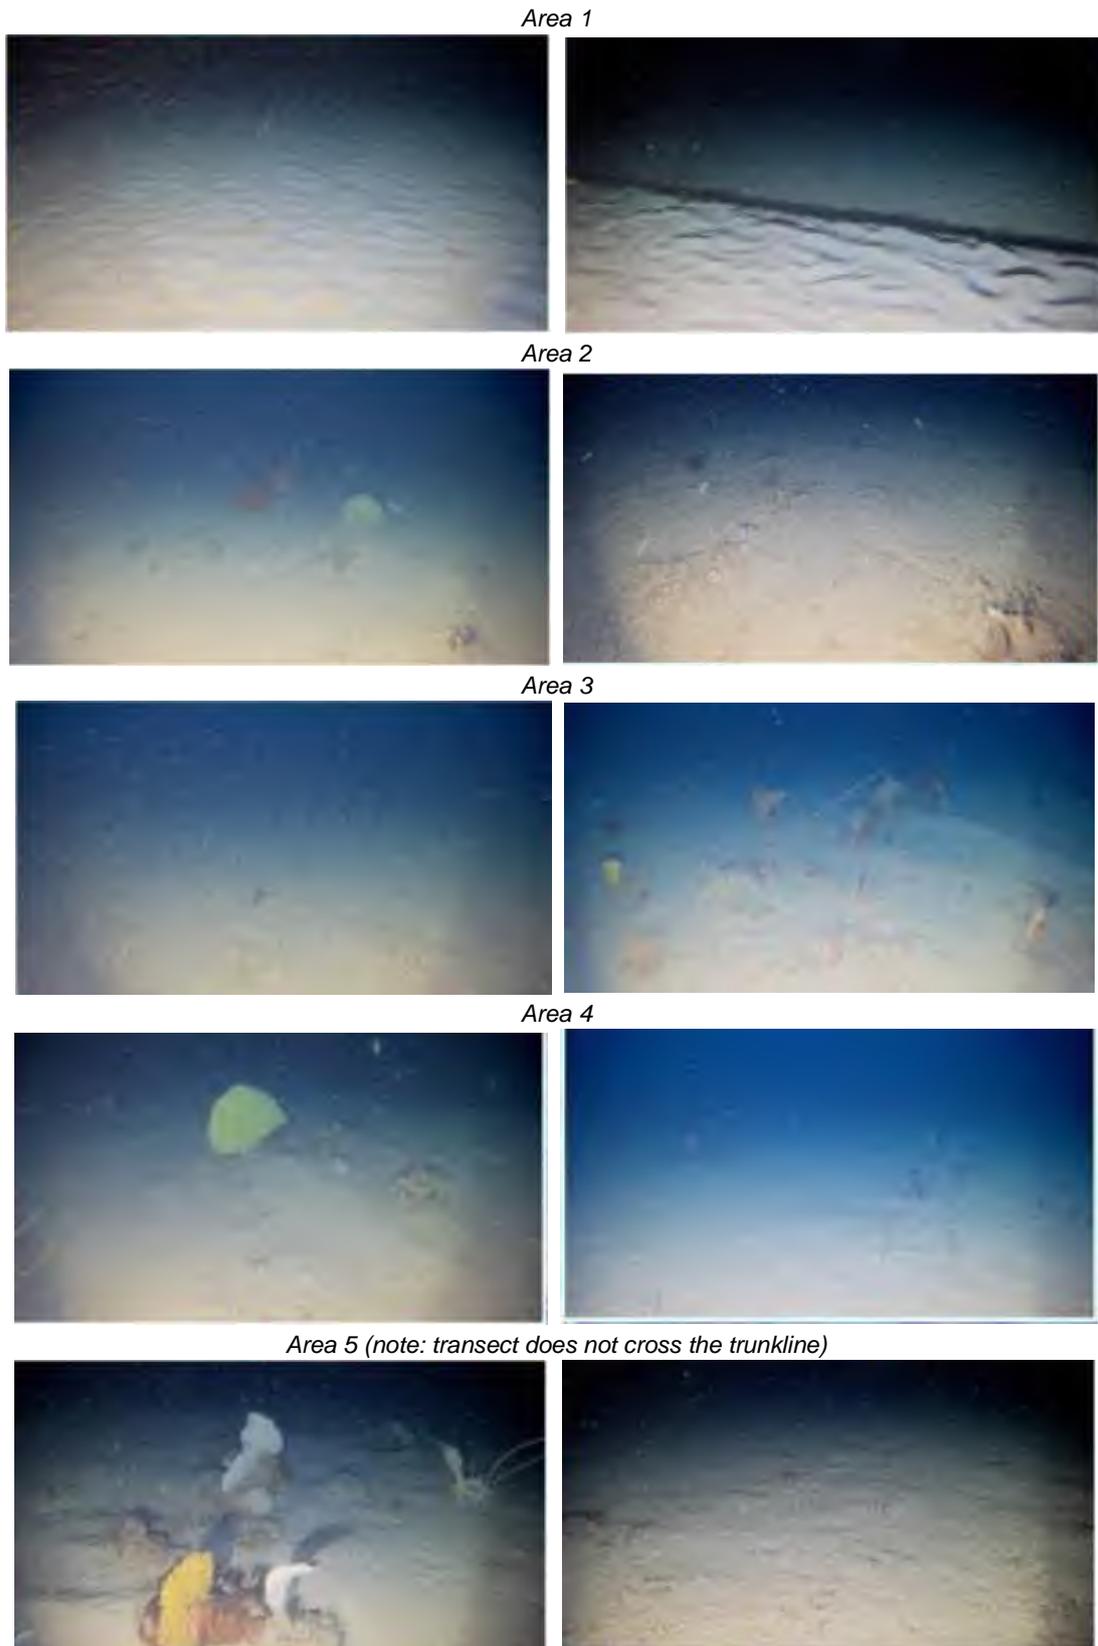

Figure 4-5: Example of ROV footage from the benthic habitat survey of the trunkline corridor within the Montebello Marine Park (photos selected from near the trunkline route)

KP 192 to Continental Slope: From KP 192 to the continental slope the seabed is generally featureless. Epifauna was most abundant on the continental shelf compared to the slope and the abundance of the fauna appeared to be inversely associated with depth, with distinct differences in the fauna on the shelf and slope. The assessment of the offshore habitats that occur on the continental shelf (<300 m water depth), have been based on ROV footage collected as part of subsea facility inspections around the Pluto field within Permit Area WA-34-L and WA-48-L. While the Pluto platform itself is located within WA-48-L, in 83 m water depth, much of the subsea infrastructure including pipelines and wellheads are in WA-34-L in ~190 m water depth. The seabed composition through these areas has been previously described as being predominantly flat and featureless and comprises thick, unconsolidated fine-grained sands. The sediments support soft sediment benthic communities dominated by infauna (including molluscs, crustaceans and worms) and isolated larger fauna (free swimming cnidarian, demersal fish and benthic crustaceans). Interestingly, the habitats containing the greatest biodiversity in these offshore environments are the habitats formed by colonising invertebrates on oil and gas subsea infrastructure including the well heads and pipelines. These habitats and the species present on these structures in the NWS of Western Australia have been recently subject to detailed quantitative and qualitative assessment (McLean et al., 2017, 2018, 2020 Bond et al., 2018a, b).

The bathymetry of the seabed increases in complexity over the continental slope and thus additional survey data has been collected over this area (Figure 4-6 and Figure 4-7). The only natural habitat on the continental slope that is not classified as soft sediment is the rock pinnacle field that lies in about 300 m water depth, approximately 360 m south of the closest part of the trunkline route (KP206) and ~3 km from the continental slope cross seabed preparation activity. Investigations in the vicinity of the pinnacle field covered an area about 1 km long x 4 km wide (Figure 4-7), but the pinnacles are isolated forms restricted to an area about 100 m long x 75 m wide, and do not constitute continuous reef. The structures provide habitat for a diverse range of epifaunal and demersal species that commonly occur across the NWMR, including a very low percentage cover of soft coral growing on top of the pinnacles.

Deep Continental Slope to PLET: Regional and site-specific studies reviewed as part of a desk top study for the OPP indicate that seabed material along the proposed Trunkline Project Area in deeper waters (and around the PLET location) is predominantly flat and featureless and comprises thick, unconsolidated fine-grained sands (Geoconsult, 2005, SKM, 2006, ERM, 2013). The low energy, soft bottom seafloor is expected to support sparse marine fauna as reported for the Exmouth Plateau. Sediments are calcareous, fine-grained and low in nutrients. Benthic communities are dominated by motile organisms, including shrimp, sea cucumbers, demersal fish and small, burrowing worms and crustaceans. No threatened species/ecological communities or migratory species were identified in previous studies (as defined under the EPBC Act).

4.5.3 Shoreline and Coastal Habitats

Coastal and shoreline habitats do not occur in the Trunkline Project Area, nor the Offshore Borrow Ground Project Area; however, they occur within the EMBA and are discussed briefly below.

The shoreline of the NWMR features tidal flats, sandy beaches and rocky shores, often exposed to high tidal variation. Coastal habitats that occur on the coastline within the EMBA include saltmarshes and mangroves around the Dampier Archipelago (Table 4-1, Appendix H).

Key habitats and ecological communities within the EMBA are identified in Table 4-6 and described in Appendix H and the Scarborough OPP.

4.5.4 Marine Fauna

The Dampier Archipelago hosts over 650 species of fish, including sawfishes, sharks, rays, as well as a wide range of marine mammals, reptiles and seabirds. The benthic and pelagic fish communities of this region are highly depth dependent, and several fish biodiversity hotspots have been identified. Inner shelf species include lizardfishes, goatfishes, trevally, angelfishes and tuskfishes. Deeper water species include deep goatfishes, threadfin bream and lizardfishes, ponyfishes, billfishes and tuna. The region also supports a number of commercial fish species including snapper, emperor, Rankin cod and bream. Resident marine mammals of the NWMR typically reside in shallower coastal waters, including bottlenose and Indo-Pacific humpback dolphins and dugongs, as well as extensive critical and biologically important habitats for marine turtles. Migratory species through the region are predominately whales and seabirds or shorebirds.

The Operational Area and wider EMBA are typically representative of the wider region. Biodiversity hotspots within the EMBA include Glomar Shoal, the outer islands of the Dampier Archipelago and the sheltered waters of Shark Bay. Table 4-6 summarises the habitats and biological communities within the EMBA, which are further detailed in Section 4.4 of Appendix H and the Scarborough OPP.

Table 4-6: Habitats and communities within the Operational Area, Zone of Influence and EMBA

Habitat/Community	Operational Area	Zone of Influence	EMBA
Habitats			
Coral	✓	✓	✓
Seagrass beds and macroalgae	-	-	✓
Mangroves	-	-	✓
Saltmarsh	-	-	✓
Communities			
Plankton	Representative of the wider NWMR, with increased abundance associated with increased primary production at the 300 m isobath on the shelf edge.		
Marine fauna	Fish biodiversity associated with benthic habitat. Typical of the NWMR, including migratory cetaceans and seabirds, resident populations of marine turtles, seabirds and shorebirds and dolphins.		
Epifauna	Generally sparse communities of soft corals, sponges, ascidians, octocorals and invertebrates. Areas of hard substrate (i.e., rock pinnacles) may feature high biodiversity of sessile epifauna by providing attachment points.	Sparse communities of sponges, anemones, crinoids, soft corals and ascidians. Some incursion into areas of higher biodiversity during winter conditions.	Predominately sparse mobile epifauna (i.e., arthropods and echinoderms) and sessile filter feeders (sponges, soft corals etc.). Increased biodiversity in nearshore fringing reefs, offshore islands and regionally significant shoals includes crustaceans, site-attached

Habitat/Community	Operational Area	Zone of Influence	EMBA
			fish, sponges, soft corals and other invertebrates.
Infauna	Bioturbating infauna, polychaetes and annelids found in areas of soft sediments.		

4.6 Protected Species

A total of 81 EPBC Act listed species considered to be MNES were identified as potentially occurring within the EMBA, of which 49 species were identified as potentially occurring within the Operational Area. Several species considered to be MNES were not included (e.g., terrestrial species occurring within the EMBA); however, species for which coastal and shoreline environments were a dominant habitat were included. The full list of marine species identified in PMST reports is provided in Appendix C.

Two conservation dependent species have also been identified with a potential to occur within the Operational Area; the scalloped hammerhead shark and the southern bluefin tuna. Species identified as potentially occurring within the Operational Area and EMBA and Biologically Important Areas (BIAs) or Habitat Critical to their Survival (Habitat Critical) that overlap the Operational Area and EMBA are listed in Table 4-7 to, and a description of species is included in Appendix H and the Scarborough OPP. Figure 4-8 to show the spatial overlap with relevant BIAs and Habitat Critical areas and the Operational Area and EMBA.

4.6.1 Fish, Sharks and Rays

Table 4-7: Threatened and Migratory fish, shark and ray species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Anoxypristis cuspidata</i>	Narrow Sawfish	N/A	Migratory	✓	✓
<i>Carcharias taurus</i>	Grey nurse shark (West coast population)	Vulnerable	N/A	✓	✓
<i>Carcharhinus longimanus</i>	Oceanic whitetip shark	Vulnerable	Migratory	✓	✓
<i>Carcharodon carcharias</i>	White shark	Vulnerable	Migratory	✓	✓
<i>Isurus oxyrinchus</i>	Shortfin mako	N/A	Migratory	✓	✓
<i>Isurus paucus</i>	Longfin mako	N/A	Migratory	✓	✓
<i>Lamna nasus</i>	Mackerel shark	N/A	Migratory	x	✓
<i>Manta alfredi</i>	Reef manta ray	N/A	Migratory	✓	✓
<i>Manta birostris</i>	Giant manta ray	N/A	Migratory	✓	✓
<i>Pristis clavata</i>	Dwarf sawfish	Vulnerable	Migratory	✓	✓
<i>Pristis zijsron</i>	Green sawfish	Vulnerable	Migratory	✓	✓
<i>Pristis</i>	Freshwater sawfish	Vulnerable	Migratory	✓	✓
<i>Rhincodon typus</i>	Whale shark	Vulnerable	Migratory	✓	✓

Table 4-8: Fish, shark and ray BIAs within the Operational Area and EMBA

Species	BIA type	Approximate distance and direction of BIA from Operational Area (km)
Whale shark	Foraging (northward from Ningaloo along 200 m isobath)	Overlaps Operational Area between about KP 72 and KP 199. Overlaps EMBA to the east
	Foraging (high density prey)	Overlaps EMBA along the Ningaloo coastline.

4.6.2 Marine Reptiles

Table 4-9: Threatened and Migratory marine reptile species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Aipysurus apraefrontalis</i>	Short-nosed seasnake	Critically Endangered	N/A	✓	✓
<i>Aipysurus foliosquama</i>	Leaf-scaled seasnake	Critically Endangered	N/A	✓	✓
<i>Caretta</i>	Loggerhead turtle	Endangered	Migratory	✓	✓
<i>Chelonia mydas</i>	Green turtle	Vulnerable	Migratory	✓	✓
<i>Dermochelys coriacea</i>	Leatherback turtle	Endangered	Migratory	✓	✓
<i>Eretmochelys imbricata</i>	Hawksbill turtle	Vulnerable	Migratory	✓	✓
<i>Natator depressus</i>	Flatback turtle	Vulnerable	Migratory	✓	✓

Table 4-10: Marine turtle BIAs within the Operational Area and EMBA

Species	BIA type	Approximate distance and direction of BIA from Operational Area (km)
Flatback turtle	Interesting (Thevenard Island, Montebello Islands, Dampier Archipelago)	Overlaps Operational Area between about KP 32 and KP 199.
	Nesting (Thevenard Island, Barrow Island, Montebello Islands, Legendre Island, Hauty Island)	Overlaps EMBA in several places. Occurs ~29 km south of KP 145, 9 km south of Offshore Borrow Ground Project Area.
	Mating (Barrow Island, Montebello Islands)	Occurs within EMBA, ~29 km south of KP 145, around Montebello Islands and Barrow Island.
	Foraging (Barrow Island, Legendre Island, Hauty Island)	Overlaps with EMBA in several places. Occurs ~65 km south of KP 145, around Barrow Island, 9 km south of Offshore Borrow Ground Project Area.
Green turtle	Interesting (North West Cape, Muiron Islands, Montebello Islands, Barrow Island)	Overlaps Trunkline Project Area at KP 32 – KP 50, and Offshore Borrow Ground Project Area. Also occurs within the EMBA around the Montebello Islands (~5 km south of KP 149), Barrow Island (~44 km south of KP 149) and around offshore fringing islands from Dampier Archipelago to Cape Range.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	BIA type	Approximate distance and direction of BIA from Operational Area (km)
	Nesting (North West Cape)	Overlaps EMBA around the offshore fringing islands from Dampier Archipelago to Cape Range, ~10 km east of KP 32 at closest point and around Montebello Islands and Barrow Island (~25 km south of KP 149).
	Foraging (North West Cape, Dixon Island, Montebello Islands, Barrow Island)	Overlaps EMBA around the offshore fringing islands from Dampier Archipelago to Cape Range, ~10 km east of KP 32 at closest point and around Montebello Islands and Barrow Island (~25 km south of KP 149). Foraging BIA ~182 km north-east is highlighted as unique to WA.
	Mating (Dampier Archipelago, Montebello Islands, Barrow Island)	Overlaps EMBA around the offshore fringing islands from Dampier Archipelago, ~10 km east of KP 32 at closest point and around Montebello Islands and Barrow Island (~25 km south of KP 149).
	Basking (Barrow Island)	Overlaps EMBA on the west coast of Barrow Island (~44 km south of KP 149).
	Aggregation (Middle and North Mangrove Island, Montebello Islands)	Overlaps EMBA, closest point is ~41 km south of KP 160.
Hawksbill turtle	Interesting (Ningaloo coast and Jurabi coast ¹ , Thevenard Island, Barrow Island, Lowendal Islands, Montebello Islands, Varanus Island)	Overlaps Trunkline Project Area from KP 32 to ~KP 53 and Offshore Borrow Ground Project Area. Overlaps EMBA at Montebello Islands and Barrow Island ~10 km south of KP 160, Thevenard Island (~131 km south of KP 180), and Cape Range (~202 km south of KP 180).
	Nesting (Ningaloo coast and Jurabi coast, Thevenard Island, Barrow Island, Varanus Island, Lowendal Islands, Dixon Island)	Overlaps EMBA around the offshore fringing islands from Dampier Archipelago, ~10 km east of KP 32 to Cape Range, Montebello Islands (~30 km south of KP 160), Barrow Island (~64 km south of KP 160).
	Foraging (De Grey River to Bedout Island, Burrup Peninsula, Cape Preston to Onslow, Dixon Island)	Overlaps EMBA at Burrup Peninsula (~10 km east of KP 32) to Onslow, Montebello Islands and Barrow Island (~30 km south of KP 160 at closest point), De Grey River to Bedout Island BIA, ~185 km north-east of Offshore Borrow Ground Project Area, is key foraging ground for all 4 species.
	Mating (Burrup Peninsular, Montebello Islands, Barrow Island)	Overlaps EMBA at Burrup Peninsula (~10 km east of KP 32), Montebello Islands and Barrow Island (~30 km south of KP 160 at closest point).
	Migration corridor (Burrup Peninsular)	Overlaps EMBA around Burrup Peninsula (~10 km east of KP 32).
Loggerhead turtle	Interesting (Ningaloo coast and Jurabi coast, Muiron Islands, Gnaraloo Bay, Montebello Islands, Lowendal Island, Dirk Hartog Island)	Overlaps Operational Area at KP 32 – KP 52. Overlaps the EMBA at ~19 km south of KP 160, surrounding the Montebello Islands and ~186 km south of KP 160 on the Ningaloo coast.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Species	BIA type	Approximate distance and direction of BIA from Operational Area (km)
	Nesting (Ningaloo coast and Jurabi coast, Muiron Islands, Gnaraloo Bay, Montebello Islands, Lowendal Island, Dirk Hartog Island, Cohen Island)	Overlaps the EMBA ~237 km south of KP 160 on the Ningaloo coast. Cohen Island BIA is ~10 km from KP 32.
	Foraging (De Grey River to Bedout Island)	De Grey River to Bedout Island BIA, ~185 km north-east of Offshore Borrow Ground Project Area, is key foraging ground for all 4 species.

Table 4-11: Habitat Critical to the survival of marine turtle species predicted to occur within the Operational Area and EMBA

Species	Genetic Stock	Nesting Locations	Approximate distance and direction from Operational Area (km)	Inter-nesting buffer	Nesting period	Hatching period
Green turtle	North West Shelf	Adele Island, Maret Island, Cassini Island, Lacepede Islands, Barrow Island, Montebello Islands (all with sandy beaches), Serrurier Island, Dampier Archipelago, Thevenard Island, Northwest Cape, Ningaloo coast	Overlaps Operational Area	20 km	Nov–Mar (peak: Dec-Feb)	Jan–May (peak: Feb–Mar)
Flatback turtle	Pilbara	Montebello Islands, Mundabullangana Beach, Barrow Island, Cemetery Beach, Dampier Archipelago (including Delambre Island and Huay Island), coastal islands from Cape Preston to Locker Island	Overlaps Operational Area	60 km	Oct–Mar (peak: Nov-Jan)	Feb–Mar
Hawksbill turtle	Western Australia	Dampier Archipelago (including Rosemary Island and Delambre Island), Montebello Islands (including Ah Chong Island, South East Island and Trimouille Island), Lowendal Islands (including Varanus Island, Beacon Island and Bridled Island), Sholl Island	Overlaps Operational Area	20 km	All year (peak: Oct–Feb)	All year (peak: Dec–Feb)
Loggerhead turtle	Western Australia	Exmouth Gulf and Ningaloo coast, Gnaraloo Bay and beaches	~200 km south-east of KP 180	20 km	Nov–Mar (peak: Jan)	Jan-May
Leatherback turtle	No overlap – nesting located in Northern Territory and North Queensland					
Olive Ridley turtle	No overlap – nesting located in Northern Australia and North Queensland

The closest known turtle nesting beaches to the Trunkline and Borrow Ground Project Areas are the islands of the Dampier Archipelago. Beaches of the Dampier Archipelago, where marine turtle nesting are summarised in Table 4-13. Rosemary Island has the most significant nesting beaches, determined as mean number of hawksbill, green and flatback turtle tracks per day (Pendoley et al., 2016) and is recognised as an internationally significant rookery for hawksbill turtles, with one of the largest nesting populations in Australia and globally (Limpus, 2009). On Rosemary Island, the majority of hawksbill nesting occurs on the north-western beaches (K. Pendoley, pers. comm.) with lower density flatback and green nesting occurring at beaches on the eastern end of the Island. Seasonality of nesting differs between flatback, green and hawksbill turtles; Table 4-12 provides a summary of the key seasonal sensitivities for protected marine reptile species identified as occurring within the Operational Area. A study by Whiting (2018) provides defined seasonality specific nesting data for Rosemary Island, and found that hawksbill turtles have a much earlier peak (October/November) compared to flatback turtles (December/January). Seasonality for green turtles was not well defined from the available data (Whiting, 2018). Given the discrete duration of surveys at Legendre Island (Biota, 2009), insufficient data is available to refine seasonality for this location.

CALM (1990) reports loggerhead turtle nesting activity on Cohen Island however, Pendoley et al. (2016) did not find evidence of loggerhead nesting activity over 20 years of track data. The northernmost key loggerhead nesting areas include the North West Cape and Muiron Islands. Any nesting activity by loggerhead turtles in the Dampier Archipelago will not represent significant rookeries for this species (PENV, 2020a). No major leatherback turtle rookeries are known to occur in Australia, with scattered nesting reported in Queensland (Limpus and MacLachlan, 1979, 1994; Limpus et al., 1984) and the Northern Territory (Hamann et al., 2006; Limpus and MacLachlan, 1994) only.

Table 4-12: Records of nesting behaviour of green, flatback and hawksbill turtles on islands of the Dampier Archipelago (CALM, 1990; Pendoley et al., 2016; Biota, 2009)

	Angel	Burru Peninsula	Conzinc	Delambre	Dolphin	Eaglehawk	East Goodwyn	East Intercourse	Elphick Nob	Enderby	Hauy	Intercourse	Keast	Lady Nora	Legendre	Rosemary	West Intercourse	West Mid Intercourse

4.6.3 Marine Mammals

Table 4-13: Threatened and Migratory marine mammal species predicted to occur within the Operational Area and EMBA

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Balaenoptera bonaerensis</i>	Antarctic minke whale	N/A	Migratory	✓	✓
<i>Balaenoptera borealis</i>	Sei whale	Vulnerable	Migratory	✓	✓
<i>Balaenoptera edeni</i>	Bryde's whale	N/A	Migratory	✓	✓
<i>Balaenoptera musculus</i>	Blue whale	Endangered	Migratory	✓	✓
<i>Balaenoptera physalus</i>	Fin whale	Vulnerable	Migratory	✓	✓
<i>Eubalaena australis</i>	Southern right whale	Endangered	Migratory	x	✓
<i>Dugong dugon</i>	Dugong	N/A	Migratory	✓	✓
<i>Megaptera novaeangliae</i>	Humpback whale	N/A	Migratory	✓	✓
<i>Orcaella heinsohni</i>	Australian Snubfin Dolphin	N/A	Migratory	✓	✓
<i>Orcinus orca</i>	Killer whale	N/A	Migratory	✓	✓
<i>Physeter macrocephalus</i>	Sperm whale	N/A	Migratory	✓	✓
<i>Sousa sahalensis (Sousa chinensis)</i>	Australian humpback dolphin	N/A	Migratory	✓	✓
<i>Tursiops aduncus</i>	Spotted bottlenose dolphin (Arafura/Timor Sea populations)	N/A	Migratory	✓	✓

It is noted that all Commonwealth waters are designated as the Australian Whale Sanctuary.

Table 4-14: Marine mammal BIAs within the Operational Area and EMBA

Species	BIA type	Approximate distance and direction from Operational Area (km)
Dugong	Breeding, nursing, calving (Exmouth Gulf and Ningaloo Reef year round).	Overlaps EMBA
	Foraging high density seagrass beds (Exmouth Gulf and Ningaloo Reef year round)	
Pygmy blue whale	Migration (Augusta to Derby, tend to pass along the shelf edge at depths of 500 m to 1000 m; appear close to coast in the Exmouth-Montebello Islands area on southern migration) Figure 4-12 (Migration timing is provided in Table 4-18)	Overlaps Trunkline Project Area between ~KP 200 and ~KP 374. Overlaps EMBA in north-east to south-west direction
	Possible Foraging (Ningaloo coast)	Overlaps EMBA
Humpback whale	Migration	Overlaps Trunkline Project Area between ~KP 32 and ~KP 145. Extends through EMBA in north-east to south-west direction out to ~100 km offshore. From North West Cape to south of Shark Bay the migration corridor is reduced to ~50 km in width
	Resting Exmouth Gulf for migration north and south)	Overlaps EMBA

4.6.3.1 Pygmy Blue Whale

The blue whale (*Balaenoptera musculus*) is currently listed as Endangered, Migratory and Cetacean under the EPBC Act and Endangered under the WA Biodiversity Conservation Act 2016 (BC Act, September 2018).

The important biological habitats for critical life stages of the pygmy blue whale life cycle are presented in the Blue Whale Conservation Management Plan (CMP) (Commonwealth of Australia, 2015) and the National Conservation Values Atlas (NCVA) (Figure 4-11). The foraging areas correspond to blue whale Biologically Important Areas (BIAs) based on foraging of varying density and likelihood and the NCVA also includes an area of offshore waters in Western Australia that represents the migratory corridor or Migratory BIA for pygmy blue whales, refer to Figure 4-12.

Thums et al. (2022) acknowledged that the majority of important migration areas for north-west Australia were encompassed by the pygmy blue whale migration BIA, as shown by 20 tracks for northbound pygmy blue whale, as presented in Figure 4-12. Furthermore, the analysis identified areas off from Ningaloo Reef to the Rowley Shoals as important for foraging (and/or breeding/resting) using the overlay of three modelled metrics (occupancy, number of whales and move persistence) by Thums et al. (2022). These include areas within and to the west of the migration BIA. The possibility that some migrating pygmy blue whales could be opportunistically foraging to the west of the migration BIA is supported by the track of one northbound individual tagged off the North West Cape in early June 2020. This tagged whale spent about 486 hours (20 days) in what appeared to be opportunistic foraging movement behaviour (Thums et al. 2022; AIMS, 2022), over an area that included time in the southern area of the Exmouth Plateau and within the migration BIA, refer to Figure 4-12. The area the whales have been shown to fan out and migrate beyond the BIA (Thums et al. (2022) is north of the Operational Area. Two southbound tracked whales also travelled predominantly within the migration BIA (refer to Figure 4-12).

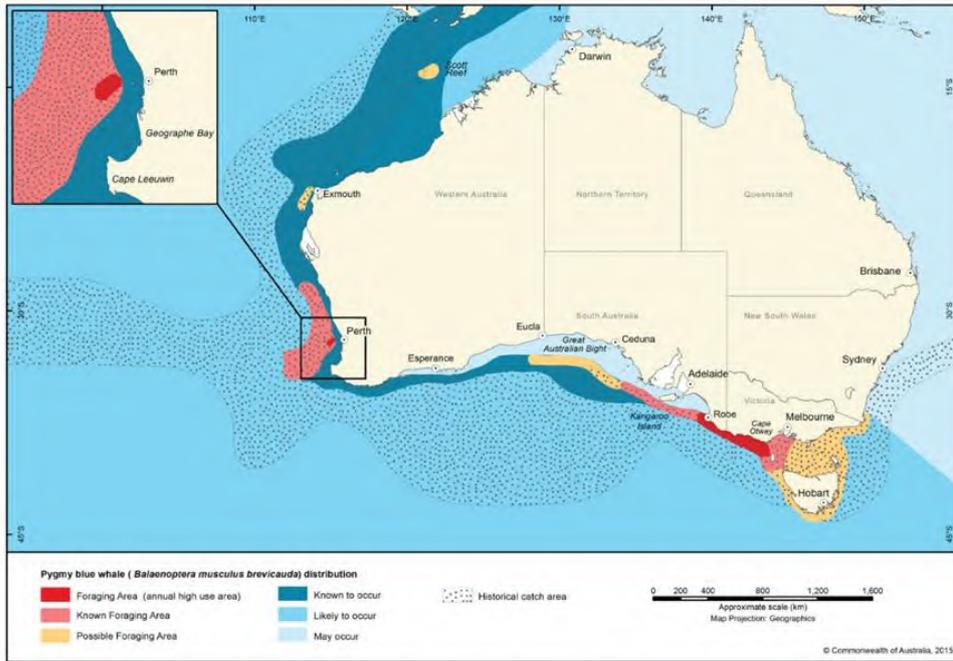

The pygmy blue whale distribution range is a spatially defined area representing presence certainty and not biologically important behaviour (e.g. breeding, foraging, migration), where pygmy blue whales are known to occur based on direct observations, satellite tagged whales or based on

acoustic detections (Commonwealth of Australia, 2015). The distribution range acknowledges the migratory movement of pygmy blue whales to the west of the Migratory BIA.

The Operational Area for the Petroleum Activities Program intersects the pygmy blue whale migration BIA (from KP200km to KP274), and also overlaps with the broader pygmy blue whale distribution range (refer to Figure 4-12). Considering this overlap, as well as the recorded presence and satellite tracking of both north and south bound tagged individuals in the Operational Area (Thums et al. (2022)), it is likely that transient individuals or small groups are occasionally in and around the Operational Area during migratory north and south seasons (April to July and October to January, respectively) (McCauley, 2011; Gavrilov et al., 2018; Thums et al., 2022). Significant numbers of pygmy blue whales are not expected to be encountered, particularly outside peak periods for northbound or southbound migrations (Figure 4-11).

The Exmouth Plateau KEF (refer to Section 4.7) is an area of localised upwelling and may be a source of food for occasional pygmy blue whale foraging. Migrating pygmy blue whales display predominantly relatively fast, directed travel (mean travel rate $2.8 \pm 0.8 \text{ km hr}^{-1}$) during the northbound peak period of May and June. This is indicating limited foraging behaviour; however it is interspersed with relatively short periods of slower speeds which may be indicative of opportunistic foraging (Thums et al., 2022). By contrast, acoustic detection (McCauley, 2011) suggests that whales are travelling faster during the southbound migration than during the northbound migration. Thums et al. (2022) also noted the rate of southbound travel was faster than on the northern migration (based on the tracks of two whales). However, short periods of putative foraging was noted for one whale.

There are limited data to indicate that the area of the Exmouth Plateau overlapped by the Operational Area (Figure 4-15) represents an area where opportunistic foraging by pygmy blue whales occurs regularly. Based on an overlap of three different metrics (occupancy, number of whales in a cell and move persistence) Thums et al. (2022) identified the most important foraging areas for pygmy blue whales is in offshore waters for north-west Australia. This included the area of the shelf edge from Ningaloo Reef to the Rowley Shoals, but this foraging area does not appear to extend out to the central portion of the Exmouth Plateau where the Operational Area is located.

Foraging Area (Annual high use area)	Blue whales are regularly observed feeding on a seasonal basis	Known to occur	Blue whales are known to occur based on direct observations, satellite tagged whales or based on acoustic detections
Known Foraging Area	Known foraging occurs in these areas but is highly variable both between and within seasons	Likely to occur	Blue whales are likely to occur based on occasional observations in the area and nearby areas
Possible Foraging Area	Evidence for feeding is based on limited direct observations or through indirect evidence, such as occurrence of krill in close proximity of whales, or satellite tagged whales showing circling tracks. Blue whales travel through on a seasonal basis, possibly as part of their migratory route	May occur	Evidence for the presence of blue whales through strandings or rare observations
		Historical catch area	Blue whales were caught during the whaling period based on whaling data

Figure 4-11: Important foraging and areas of occurrence for pygmy blue whales as presented in the Blue Whale Conservation Management Plan (Commonwealth of Australia, 2015). Note: Known to occur area in the BWCMP is the same as the distribution range presented in the National Conservation Values Atlas.

4.6.4 Seabirds and Migratory Shorebirds

Table 4-15: Threatened and migratory seabird and migratory shorebird species predicted to occur within the Operational Area and EMBA²

Species name	Common name	Threatened status	Migratory status	Potential for interaction	
				Operational Area	EMBA
<i>Actitis hypoleucos</i>	Common sandpiper	N/A	Migratory	✓	✓
<i>Anous stolidus</i>	Common noddy	N/A	Migratory	✓	✓
<i>Anous tenuirostris melanops</i>	Australian lesser noddy	Vulnerable	N/A	✗	✓
<i>Apus pacificus</i>	Fork-tailed swift	N/A	Migratory	✓	✓
<i>Ardenna carneipes</i>	Flesh-footed shearwater	N/A	Migratory		✓
<i>Ardenna pacifica</i>	Wedge-tailed shearwater	N/A	Migratory	✓	✓
<i>Calidris acuminata</i>	Sharp-tailed sandpiper	N/A	Migratory	✓	✓
<i>Calidris canutus</i>	Red knot	Endangered	Migratory	✓	✓
<i>Calidris ferruginea</i>	Curlew sandpiper	Critically Endangered	Migratory	✓	✓
<i>Calidris melanotos</i>	Pectoral sandpiper	N/A	Migratory	✓	✓
<i>Calonectris leucomelas</i>	Streaked shearwater	N/A	Migratory	✓	✓
<i>Charadrius leschenaultia</i>	Greater sand plover	Vulnerable	N/A	✗	✓
<i>Charadrius veredus</i>	Oriental plover	N/A	Migratory	✗	✓
<i>Diomedea amsterdamensis</i>	Amsterdam albatross	Endangered	Migratory	✗	✓
<i>Diomedea exulans</i>	Wandering albatross	Vulnerable	Migratory	✗	✓
<i>Falco hypoleucos</i>	Grey falcon	Vulnerable	N/A	✗	✓
<i>Fregata ariel</i>	Lesser frigatebird	N/A	Migratory	✓	✓
<i>Fregata minor</i>	Great frigatebird	N/A	Migratory	✓	✓
<i>Glareola maldivarum</i>	Oriental pratincole	N/A	Migratory		✓

² N.B. The wedge-tailed shearwater was not identified in the PMST as potentially occurring within the OA; however, given a BIA for wedge-tailed shearwater breeding partially overlaps the OA, it is considered possible that the species may be encountered within the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 4-16: Seabird and shorebird BIAs within the Operational Area and EMBA

Species	BIA type	Approximate distance and direction from Operational Area (km)
Roseate tern	Breeding (Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef)	Overlaps Operational Area from KP 32 to ~KP 58. Breeding populations occur throughout the EMBA on fringing islands of the Burrup Peninsula, Montebello Islands, North Turtle Island, Airlie Island, the Ningaloo coast and Bernier Island.
Wedge-tailed shearwater	Breeding (offshore islands of the Pilbara, Gascoyne (Muiron Islands) Breeding, foraging (Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef)	Overlaps Trunkline Project Area from KP 32 to ~KP 220, and Offshore Borrow Ground Project Area. Occurs throughout EMBA across fringing islands of Dampier Archipelago to Cape Range and to Barrow Island.
Lesser crested tern	Breeding (Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef)	Breeding populations occur in the EMBA around North Turtle Island, Lowendal Islands, and Thevenard Island.
Lesser frigatebird	Breeding (Kimberley, Pilbara and Gascoyne coasts and islands including Ashmore Reef)	Breeding population occurs in the EMBA in up to a 30 km radius from North Turtle Island
Australian fairy tern	Breeding (Pilbara and Gascoyne coasts and islands) with 5 km foraging buffer	Overlaps the Trunkline Project Area from KP 32 to ~KP 34 and directly adjacent to Offshore Borrow Ground Project Area to the south. Breeding populations occur within the EMBA around fringing islands of Burrup Peninsula, Cape Preston, Thevenard Island, Montebello Islands, Lowendal Islands and Barrow Island and Bernier and Dorre islands.
Brown booby	Breeding (Kimberley and northern Pilbara coasts and islands also Ashmore Reef) with 40 km foraging buffer	Occurs in the EMBA at North Turtle Island, 190 km north-east of Operational Area.

Table 4-17 above highlights the timing of critical life stages for key seabird and shorebird species that utilise island and mainland coastal habitats in the Dampier Archipelago. There are 42 islands, islets and rocks off the coast of Dampier and the area includes significant breeding grounds and refuge sites for a variety of bird species.

Wedge-tailed shearwater

The Wedge-tailed shearwater is listed as migratory under the EPBC Act. Section 8.2 of the Master Existing Environment (Appendix H) provides a description of Wedge-tailed shearwaters. Approximately 1 million pairs breed in Australia, most of which do so on islands in Western Australia between Rottnest Island in the south to Ashmore Reef in the north. The largest breeding populations are at the Houtman Abrolhos (600,000 pairs - Surman and Nicholson 2009), and throughout the NWS region of the NWMR, where large populations on Muiron Islands (300,000 pairs) and Serrurier Island (60,000 pairs) exist (Surman and Nicholson 2009, 2015).

Nesting occurs around the islands of the Dampier Archipelago and has been reported for Rosemary Island (Inland between Beach 7 and Hungerford Bay) (Parks and Wildlife & AMOSC 2014).

Adults are absent from their breeding colonies during the interbreeding period and return from their tropical Indian Ocean over-wintering grounds from late June onwards to re-excavate their burrows. This species is highly synchronous in timing of breeding; all eggs within a colony are laid within a ten-day period. They lay their single egg during early November, which is then incubated until the chick hatches (after 53 days) in early January. Once hatched, adults leave the burrows to forage locally during the day returning at night to feed chicks until they are ready to fledge (Nicholson 2002). Due to the high synchronicity in egg laying, fledging period is generally restricted to the first two weeks of April (Nicholson 2002).

Breeding behaviours are nocturnal in wedge-tailed shearwaters. Adults return to and depart the colony at night and fledglings depart the colony at night. In the lead up to fledging, chicks also leave their burrows to exercise their wings outside burrows.

Adults may not return to feed chicks each night; wedge-tailed shearwaters breeding on the Muiron Islands (north) undertook bimodal foraging behaviour: extensive foraging trips during the incubation period (1,200 – 1400 km) and shorter trips during chick rearing (<300 km, Cannell et al. 2019). Longer foraging trips took individuals in a NW direction offshore towards oceanic seamounts. Conversely, the shorter tended to include waters to the west and NW of the Muiron Islands (Cannell et al. 2019).

The key BIAs for NWMR are: (i) breeding (encompassing offshore and coastal islands and mainland sites) and (ii) breeding and foraging with this BIA extending west over the offshore waters of the NWS (Figure 4-14). A foraging (in high numbers BIA) is located south of Shark Bay to Geographe Bay and includes offshore waters and the Abrolhos Houtman islands.

Australian Fairy Tern

The Australian fairy tern (*Sternula nereis nereis*) is listed as vulnerable under the EPBC Act. Within Western Australia the sub species includes a migratory population with individuals occasionally migrating into the southern region of the NWMR during the winter months.

Within the NWMR, breeding occurs in small colonies between June-September on offshore islands, including Simpson Island, Barrow Island, the Montebello Islands, the Lowendal Islands, Thevenard Island, Serrurier Island, the islands in the Dampier Archipelago, Maryanne Shoals and Egret Island (Dunlop 2018; Johnstone et al 2013; Surman pers. comm.). The Australian Fairy Tern BIAs in proximity to the Operational Area are shown in Figure 4-14.

While information regarding foraging ecology of this species within the NWMR is lacking, the Australian fairy tern has been studied in South Australia. Here, the species typically forages in inshore waters and has been reported to rarely travel beyond 2 km during the breeding season (Paton and Rogers 2009). Australian fairy terns are diurnal foragers.

Roseate tern

The roseate tern (*Sterna dougalli*) is listed as migratory under the EPBC Act. There are many breeding populations for this species in the NWMR including Ashmore Reef, Bonaparte Archipelago, Lacepede Islands, Dampier Archipelago and the Lowendal Islands.

The largest roseate tern breeding colony in Western Australia is in the Houtman Abrolhos Islands (Surman and Nicholson, 2009). Large colonies breed within the Lowendal Island and Montebello Island region where there is a stronghold for this species (Higgins and Davies 1996). A large breeding colony has also been recorded on Goodwyn Island on the Dampier Archipelago (Higgins and Davies 1996). Peak breeding times across the NWMR is between May to August.

Birds are known to usually move away from breeding colonies following breeding, but their non-breeding range is not well defined (Higgins and Davies 1996). Many non-breeding roseate terns have been observed at several remote locations in the Kimberley and there are high numbers also recorded at the Eighty Mile Beach Ramsar site (Surman pers obs).

Roseate terns will forage diurnally, up to 60 km from their colonies and always over deeper shelf waters, rather than shallow coastal areas (Surman and Wooller, 2003).

Breeding BIAs across the NWMR are associated with known breeding colonies on islands, while a resting BIA has been identified at Eighty Mile Beach (Figure 4-14).

Section 8.2 of the Master Existing Environment further describes the ecology and biology of Roseate terns.

Caspian tern

The Caspian tern is listed as migratory under the EPBC Act. It is moderately common across coastlines of the NWMR and offshore islands (Johnstone et al. 2013).

Breeding occurs as solitary nests or in colonies (up to 52 breeding pairs observed) mainly on islands, including North Turtle Island, Dampier Archipelago including Enderby island, and Frazer Island, and occasionally on mainland coasts, such as Cape Preston and the Northwest Cape, from late March to early November (Johnstone et al 2013).

During breeding, adults can forage up to 60 km from the colony during this period to catch fish and meet their elevated energetic requirements at this time (Burger et al. 1996; Balance et al. 2008). The Caspian tern is a diurnal forager, with the length and frequency of foraging trips, as well as relative time spent foraging or attending chicks, changes with food resource availability (Dunlop & McNeill 2017). Caspian tern usually forage in shallow, sheltered waters, by plunge-diving for various prey species (Serventy et al. 1971).

Although foraging BIAs occur in the SWMR, no BIAs for this species have been identified in the NWMR.

Section 8.2 of the Master Existing Environment further describes the ecology and biology of Caspian terns.

4.6.5 Seasonal Sensitivities for Protected Species

Seasonal sensitivities for protected migratory species identified as potentially occurring within the Operational Area are identified in Table 4-18. Movement patterns of all protected species identified in Section 4.5.1 are described in Appendix H and the Scarborough OPP.

Table 4-18: Key seasonal sensitivities for protected migratory species identified as occurring within the Operational Area

Species	Life stage/Activity	J	F	M	A	M	J	J	A	S	O	N	D

4.7 Key Ecological Features (KEFs)

Key Ecological Features (KEFs) are not MNES, however are considered components of a Commonwealth marine area. They are considered important for a marine regions biodiversity or ecosystem-based functioning. Eight KEFs overlap the EMBA, of which three overlap the Operational Area (Figure 4-15), identified in Table 4-19, and described in detail in Section 5.5, Appendix H and the Scarborough OPP.

Table 4-19: KEFs within the Operational Area and EMBA

Key Ecological Feature	Operational Area	EMBA	Description
Exmouth Plateau	Overlaps Operational Area from KP 380 to Offshore Project Area	100% overlap with the EMBA	Water depth: 500 m – 5000 m. Unique seafloor features with regional ecological significance. Believed to affect deep water flow and associated with internal tides, contributing to localised upwelling.
Continental Slope Demersal Fish Communities	Small extent (<0.05%) transects the Trunkline Project Area at ~KP 200	21% overlap with the EMBA	High biodiversity values, hosting more than 500 fish species, 76 of which are endemic.
Ancient Coastline at 125 m depth contour	Overlaps Operational Area around KP 190. Approximately 0.03% of the KEF transects the Trunkline Project Area	30% overlap with the EMBA.	Water depths 115 m – 135 m. Provides hard benthic substrate for regionally significant biodiversity hotspots and localised upwelling. The area where the KEF transects the Trunkline Project Area is predominantly bare sand habitat supporting sparse coverage of benthic organisms.
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	~166 km south-west of KP 180	100% overlap with the EMBA	Interacts with Leeuwin Current to create localised upwellings and support aggregations of marine megafauna, migratory fish and seabirds.
Commonwealth waters adjacent to Ningaloo Reef	~210 km south-west of KP 180	70% overlap with the EMBA.	Defined as the waters contained within the Ningaloo AMP and thus shares the same ecological values and integrity.
Glomar Shoal	~62 km north of KP 32	100% overlap with the EMBA	Water depths 33 m – 77 m. Defined as a KEF due to high productivity and marine life aggregations.
Western demersal slope and associated fish communities	~875 km south-west of KP 160	1% overlap with the EMBA	Supports high biodiversity of demersal fish communities, with over 480 species described and 31 endemic to the region. Diversity attributed to overlap of ancient and extended Indo-west Pacific and temperate Australasian fauna.
Wallaby Saddle	~723 km south-west of KP 160	22% overlap with the EMBA	Water depths 4000 m – 4700 m. Unique habitat that does not occur at this size in the region. Historically significant sperm whale and baitfish aggregations and relatively enhanced biodiversity.

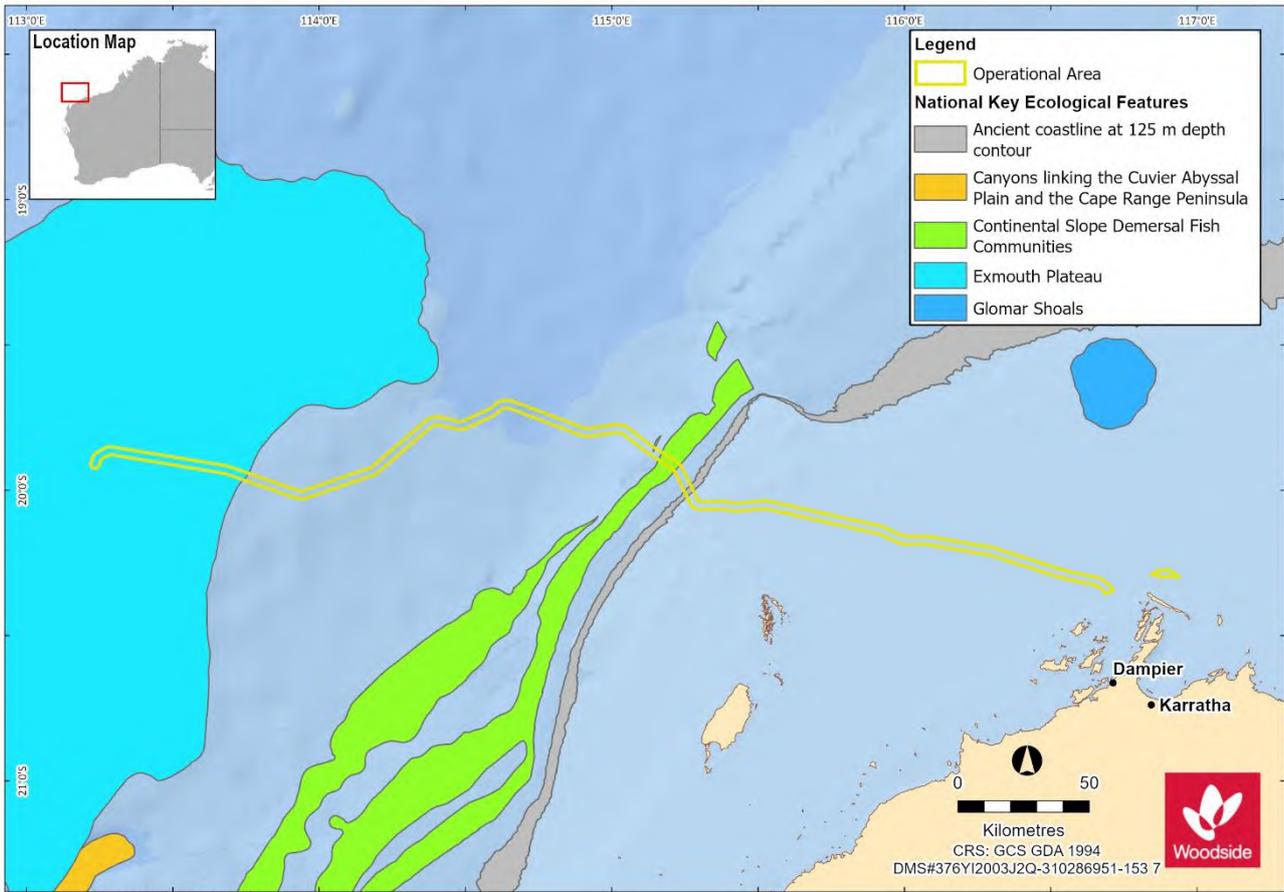

Figure 4-15: KEFs overlapping the Operational Area

4.8 Protected Places

The NWMR offshore environments contains high value or sensitive environmental assets (such as habitat and species) including Commonwealth offshore waters, as well as the wider regional context including coastal waters and habitats.

Many sensitive receptor locations are protected as part of Commonwealth and State managed areas and have been allocated conservation objectives (International Union for Conservation of Nature (IUCN) Protected Area Category) based on the Australian IUCN reserve management principles in Schedule 8 of the EPBC Regulations 2000.

Protected places within the Operational Area and EMBA are identified in Table 4-20 and presented in Figure 4-15. Appendix H and the Scarborough OPP outline the natural values and sensitivities of protected places and other sensitive areas in the Operational Area and EMBA. In addition, Table 4-21 outlines the cultural, heritage and socio-economic values of the relevant AMPs.

Table 4-20: Established protected places and other sensitive areas overlapping the Operational Area and EMBA

	Distance (km) and direction from Operational Area to protected place or sensitive area	IUCN category* or relevant park zone overlapping the Operational Area and/or EMBA
Australian Marine Parks (AMPs) overlapping EMBA		
Montebello	Overlaps Operational Area between KP 108.4 – KP 191.6	Multiple Use Zone (IUCN VI)

Table 4-21: Cultural, heritage, socio and economic values of the Montebello and Dampier Marine Parks

Value Type	Value Description
Montebello Marine Park	
Cultural Values <i>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been using and managing sea country for tens of thousands of years</i>	At the commencement of the plan, 2018, there was limited information about the cultural significance of this Marine Park. An ethnographic survey with Traditional Custodians Section 4.9.1) did not identify any cultural features or heritage values within the marine park. In addition, none were identified during consultation with Traditional Custodians (See Section 5)
Heritage values	Two known ship wrecks, Trial (wrecked 1622) and Tanami (unknown date)
Socio and economic value	Tourism, commercial fishing, mining and recreation are important activities in the Marine Park. Contribute to the wellbeing of regional communities and the prosperity of the nation.
Dampier Marine Park	
Cultural Values <i>Sea country is valued for Indigenous cultural identity, health and wellbeing. Across Australia, Indigenous people have been using and managing sea country for tens of thousands of years</i>	Specific cultural values have not been provided in the Management Plan. An ethnographic survey with Traditional Custodians Section 4.9.1) did not identify any cultural features or heritage values within the marine park. In addition, none were identified during consultation with Traditional Custodians (See Section 5)
Heritage values	No known heritage values within the park
Socio and economic value	Port activities, commercial fishing and recreation, including fishing are important activities in the Marine Park. Contribute to the wellbeing of regional communities and the prosperity of the nation.

4.9 Socio-economic Environment

4.9.1 Cultural Features and Heritage Values

4.9.1.1 Background

Woodside recognises the 'environment' for the purpose of the evaluation required under the Environment Regulations includes:

- the heritage value of places; and
- the social, economic, and cultural features of the broader environment.

In this section, the heritage value of places within the Operational Area and EMBA and the cultural features of the Operational Area and EMBA are described.

In line with The Burra Charter: The Australia ICOMOS Charter for Places of Cultural Significance (ICOMOS 2013) (Burra Charter) and associated practice notes, Woodside understands heritage value to refer to the cultural significance of a place to an individual or group. A cultural feature, by contrast, is understood to be comparable to the Burra Charter term “fabric” and refer to a place’s elements, fixtures, contents and objects which have cultural values. Although these features are

necessarily physical, the place they inhabit or comprise may have tangible and intangible dimensions (ICOMOS 2013).

Woodside has undertaken archaeological assessments and ethnographic surveys to identify potential cultural values or features that may be impacted by Scarborough activities. These works have not identified heritage places, objects or values which will be impacted by the activities planned under this EP. However, through consultation with relevant persons, Woodside recognises the deep spiritual and cultural connection to the environment³ that First Nations people hold.

4.9.1.2 First Nations peoples

As a starting point for understanding cultural features of the environment for First Nations groups, Woodside uses the existing systems, such as native title, to identify First Nations groups that may have functions, interests or activities that may be affected. To that end, Woodside identifies native title representative bodies and nominated representative entities (defined in Section 5.3), as well as native title claims, determinations and Indigenous Land Use Agreements (ILUAs) which the EMBA overlaps. Native title claims, determinations and ILUAs are defined under the Native Title Act 1993 (Cth). While acknowledging that cultural features and heritage values may exist outside of the native title framework, Woodside considers this to be the broadest extent over which First Nations groups have claimed native title rights and interests.

Native title claims are applications made to the Federal Court under the Native Title Act 1993 for a determination or decision about native title in a particular area. A claim is made by a native title claim group which asserts it holds native title rights and interests in an area of land and/or water, according to its traditional laws and customs. By making a claim, the native title claim group seeks a decision that native title exists so that its native title rights and interests are recognised by the common law of Australia. This is called a native title determination. A determination is a decision by a recognised body, such as the Federal Court or High Court of Australia, that native title either does or does not exist in relation to a particular area ([Native Title Tribunal](#)).

A requirement to establishing a positive determination of native title in court is proving that there is an organised society that occupied the land and/or waters at the time of British annexation. The requirement of an 'organised society' is set out by Justice Toohey in the historic judgment of *Mabo v Queensland (No 2)* [[1992 HCA 23](#); [\(1992\) 175 CLR 1](#) ('Mabo')]. Justice Toohey had the following to say (at 187):

it is inconceivable that indigenous inhabitants in occupation of land did not have a system by which land was utilized in a way determined by that society. There must, of course, be a society sufficiently organized to create and sustain rights and duties...

Therefore, Woodside understands that native title rights and interests are held communally by an organised society, that native title claims are understood to represent the area over which First Nations groups are claiming these rights and interests, and that native title determinations provide clarity on where native title rights and interests are found to either exist or not exist. Where native title rights or interests are determined to exist they will be held by a Registered Native Title Body Corporate (section 57, Native Title Act 1993) in trust or as agent for native title holders.

ILUAs are voluntary agreements between native title parties and other people or bodies about the use and management of land and/or waters and are registered by the Native Title Registrar in the Register of ILUAs. An ILUA can be made over areas where:

- native title has been determined to exist in at least part of the area; or

³ Definition of 'Environment' in Regulation 4 of the OPPGS (Environment) Regulations are defined as:

- a) ecosystems and their constituent parts, including people and communities; and
- b) natural and physical resources; and
- c) the qualities and characteristics of locations, places and areas; and
- d) the heritage values of places; and includes
- e) the social, economic and cultural features of the matters mentioned in paragraphs (a), (b), (c) and (d)

- a native title claim has been made; or
- where no native title claim has been made.

While registered, ILUAs operate as a contract between the parties, including relevant native title holders ([Native Title Tribunal](#)).

The Native Title Act provides for a Representative Aboriginal/Torres Strait Islander Body (Native Title Representative Body) to be recognised by the Commonwealth Minister for an area. Native Title Representative Bodies have specialist functions set out in the Native Title Act within the area for which they are the Native Title Representative Body. However, the functions of a Native Title Representative Body are such that they do not hold details on the cultural features or heritage values of an area and therefore do not inform Woodside's understanding of heritage values or cultural features.

For the activity in this EP, there are seven coastal ILUAs and five native title claims or determinations overlapping the EMBA (see Figure 4-17).

4.9.1.3 Coastally Adjacent First Nations Groups

Woodside understands that First Nations groups are keenly aware of the extent of their rights, interests and responsibilities for Country, and these are generally discrete, defined areas, including areas of sea (Smyth 2007). To identify cultural features and heritage values which may exist outside of native title claim, determination and ILUA areas, Woodside considers native title claims, determinations and ILUAs coastally adjacent to the EMBA to be an instructive means of identifying potentially relevant First Nations groups to be consulted (See Table 5-2).

That said, Woodside understands from engagement with stakeholders that extending a native title group's responsibility to areas which those groups have elected to not include in their claims or ILUAs can have significant cultural consequences for First Nations groups and individuals. This may also, over time, build expectations in the broader First Nations community that a group is responsible for maintaining environmental values in areas for which they do not hold traditional knowledge. Woodside also acknowledges that a First Nations groups relative proximity to any Operational Areas or EMBA is not necessarily a meaningful indicator of the connection of Indigenous groups to the area, and providing advice over such areas can be culturally dangerous. As a result, caution must be used when conducting broader engagement.

There are two ILUAs which overlap the proposed Borrow Ground area. Robe River Kuruma Aboriginal Corporation is party to the KM & YM ILUA which overlaps the proposed Borrow Ground. Woodside understands that this ILUA relates to the definition of the boundary between WAC and Robe River Kuruma Aboriginal Corporation's respective native title areas and does not include any cultural values relevant for to the Borrow Ground area. Wirrawandi Aboriginal Corporation is also party to the KM & YM ILUA which overlaps the proposed Borrow Ground. Woodside understands that this ILUA relates to the definition of the boundary between Wirrawandi Aboriginal Corporation and Robe River Kuruma Aboriginal Corporation's respective native title areas and does not include any cultural values relevant to the Borrow Ground area. The Kuruma Marthudunera and Yaburara and Coastal Mardudhunera ILUA overlaps the proposed Borrow Ground area, however there are no Traditional Custodian Groups specified.

A summary of native title claims, determinations and ILUAs overlapping or coastally adjacent to the EMBA is set out in Table 4-22. Claims and determinations have not been differentiated in this table, as it is acknowledged that either of these may indicate the existence of rights and interests.

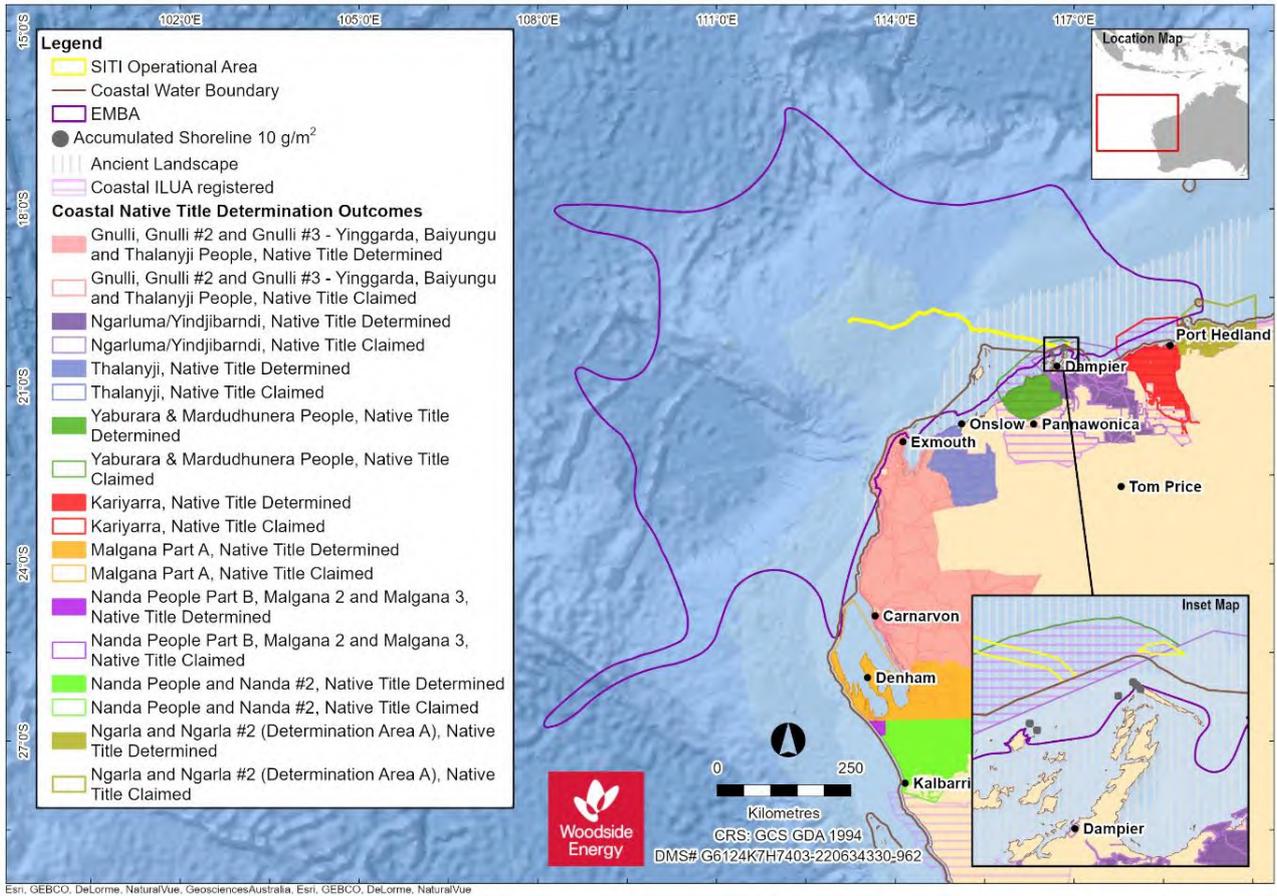

Figure 4-17: Operational Area and EMBA in relation to native title claims, determination and ILUAs

Table 4-22: Summary of Native Title Claims, Determinations and ILUAs which overlap or are coastally adjacent to the EMBA.

Claim / Determination / ILUA	Registered Native Title Body Corporate	Overlap with EMBA	Coastally Adjacent to the EMBA

4.9.1.4 Marine Parks

Woodside acknowledges that Commonwealth and State Marine Park Management Plans have sought to recognise cultural values of First Nations groups. Australian Marine Parks (AMP) describe this framework in the following way: ‘when making decisions about what can occur in marine parks and what action we will take to protect marine parks, we take values into account’. AMP summarises these values as natural values, cultural values, heritage values and socio-economic values. Woodside is triggered to undertake an assessment of cultural values within Marine Park Management Plans where the operational area or EMBA overlaps an AMP. Woodside considers the management plans of marine parks that overlap the Operational Area and the EMBA to determine whether cultural features and heritage values have been identified and whether there are specified representative bodies referenced to contact regarding potential cultural features and heritage places.

The Operational Area overlaps features of the Montebello AMP. The EMBA overlaps features of a further eight AMPs under the South-West Marine Parks Network Management Plan 2018 and North-West Marine Parks Network Management Plan 2018. The Operational Area does not overlap any State Marine Parks, however the EMBA overlaps six State Marine Parks. Where these plans specify identifiable representative bodies who may hold knowledge of heritage values or cultural features—including but not limited to Registered Native Title Bodies Corporate—these bodies are consulted (see Appendix F, Table 1). Consultation with these groups may identify heritage values and cultural features beyond those addressed in the marine park management plans. Seven identifiable representative bodies were specified for the AMPs overlapped by the EMBA (see Table 4-23).

The marine park management plans did note for the Abrolhos, Dampier, Gascoyne, Montebello, Ningaloo and Shark Bay AMPs that the Yamatji Marlpa Aboriginal Corporation (YMAC) is the relevant Native Title Representative Body, and that for Eighty Mile Beach AMP both YMAC and Kimberley Land Council (KLC) are native Title Representative bodies. Consultation with YMAC and KLC included discussion of the Traditional Custodians who may hold knowledge of heritage values or cultural features (See Appendix F, Table 1).

Table 4-23: Summary of Commonwealth and State Marine Park Management Plan EMBA overlap

Marine Park Management Plan	Operational Area Overlap	EMBA Overlap	Specified Bodies
Commonwealth Marine Park Management Plan			
Abrolhos AMP	No	Yes	No identifiable body specified.
Argo-Rowley Terrace AMP	No	Yes	No identifiable body specified.
Carnarvon Canyon AMP	No	Yes	No identifiable body specified.
Dampier AMP	No	Yes	NAC, Yindjibarndi Aboriginal Corporation.
Eighty Mile Beach AMP	No	Yes	Karajarri Traditional Lands Association, Nyangumarta Karajarri Aboriginal Corporation, Nyangumarta Warrarn Aboriginal Corporation, Wanparta Aboriginal Corporation.
Gascoyne AMP	No	Yes	No identifiable body specified.
Montebello AMP	Yes	Yes	No identifiable body specified.
Ningaloo AMP	No	Yes	No identifiable body specified.
Shark Bay AMP	No	Yes	No identifiable body specified.
State Marine Park Management Plan			
Barrow Island Marine Management Area	No	Yes	No identifiable body specified.
Barrow Island MP	No	Yes	No identifiable body specified.
Cape Range National Park	No	Yes	No identifiable body specified.

Marine Park Management Plan	Operational Area Overlap	EMBA Overlap	Specified Bodies
Montebello Islands MP	No	Yes	No identifiable body specified.
Muiron Islands Marine Management Area	No	Yes	No identifiable body specified.
Ningaloo MP	No	Yes	NTGAC.

In the management plans for all nine AMPs it is noted that “Sea country is valued for Indigenous cultural identity, health and wellbeing.” Cultural identity is understood to refer to the fact that “essence of being a 'Saltwater' person is ontological rather than merely technological. That is, it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people.” (McDonald and Phillips, 2021)

The South-West Marine Parks Network Management Plan 2018 also notes that cultural features of the Abrolhos AMP include strong stories that connect ocean and land. No impact pathway that may disrupt the preservation of stories or other intangible heritage from this Petroleum Activities Program has been identified. The plan also references artefacts located outside of the AMP and the EMBA on islands in State waters.

The North-West Marine Parks Network Management Plan 2018 also notes that cultural features of the Eighty Mile Beach AMP include traditional practices continuing today, staple foods of living cultural value and that access to sea country by families is important for cultural traditions, livelihoods and future socio-economic development opportunities. No impact pathway that may disrupt traditional practices or access to sea country from this Petroleum Activities Program has been identified. Management of cultural features within marine ecosystems, including food sources, is discussed in Section 4.9.1.4.

Both management plans for the AMPs note shipwrecks within the AMPs and overlap with World, National and Commonwealth heritage lists. These are addressed in Sections 4.9.1.4 and 4.9.1.9 below.

The Management Plan for the Ningaloo Marine Park and Muiron Islands Marine Management Area 2005 – 2015: Management Plan Number 52 (relating to the Muiron Islands Marine Management Area and Ningaloo Marine Park) notes the aesthetic values of the seascape as a cultural value and that “Panoramic vistas of turquoise lagoon waters, reefs, beaches, breaking surf and the blue open ocean beyond the reef line are major attractions of the reserves.” In particular, the plan notes that “Inappropriate structures along the coastline, on the islands and in the surrounding waters have the potential to degrade the aesthetic values of the reserves. Coastal developments and maritime infrastructure projects must therefore be planned with careful consideration of this issue.” As the Petroleum Activities Program described in this EP does not include the addition of any structures within these parks, no impacts on the aesthetic values of these parks are anticipated.

A number of management plans for the state marine parks also note Indigenous and maritime heritage within the marine parks. These are addressed in Sections 4.9.1.4 below.

4.9.1.5 Sea Country Values

‘Sea Country’ can be defined as the area of sea over which a First Nations group has interests, cultural value, connection and use. It has been noted that “the saltwater peoples of the north-west are associated with discrete clan estates or tribal areas, often referred to in contemporary Aboriginal English as ‘saltwater country’ or ‘sea country’. Country’ refers to more than just a geographical area: it is shorthand for all the values, places, resources, stories and cultural obligations associated with that geographical area.” (Smyth 2007). “Sea country is valued for Indigenous cultural identity, health and wellbeing” (DNP 2018a, 2018b). Cultural identity is understood to refer to the fact that “essence of being a 'Saltwater' person is ontological rather than merely technological. That is, it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people” (McDonald and Phillips, 2021).

In terms of seascape extent, McNiven (2004) suggests that “For those mainland groups whose exploitation of the sea was limited to littoral resources, it is likely that seascapes extended no more than c. 20–30 km out to sea, out to the horizon and the limit of human visibility. ... However, in some coastal places, clouds that can be seen well over 100 km out to sea are imbued with spiritual significance. For those groups with elaborate canoe technology, seascapes extend well over the horizon.” While there is some evidence of traditional watercraft in Australia’s North West, the recorded evidence is limited to travel across inland rivers (e.g. Barber and Jackson 2011) or travel between coastal islands (Paterson et al 2019).

Woodside recognises the potential for marine ecosystems to include cultural features as well as environmental values. The link between environmental protection and cultural heritage protection is illustrated in the Australian Government’s Indigenous Protected Areas Program. The Indigenous Protected Areas program provides for “areas of land and sea managed by Indigenous groups as protected areas for biodiversity conservation...IPAs deliver environmental benefits...Managing IPAs also helps Indigenous communities protect the cultural values of their country for future generations...” (DCCEEW, 2023). This intrinsic link concept is also described by MAC (2021) as it relates to the values of the marine environment that are of cultural importance to MAC based on engagement with their Elders and Murujuga Land and Sea Unit Rangers. Elders were clear that all living things in Mermaid Sound are connected and that Mermaid Sound and Dampier Archipelago (Murujuga) are considered one place where the entire environment and all ecosystems hold both cultural and environmental value, with these types of values (cultural and environmental) intrinsically linked (MAC, 2021 as cited in Woodside 2023a).

Cultural features of coastal areas may include marine species that may travel many thousands of kilometres through areas with similar cultural values to multiple Indigenous language groups. Some species may travel as far as 5,000 km from Antarctica to the Kimberley region of Western Australia (Double et al., 2010, 2012), passing Indigenous language groups along the entire west coast of Australia. Distribution and migratory patterns of migratory species are described in Section 4.6 and Appendix H.

Sea country values have been defined using multiple lines of evidence including:

- Desktop assessment of sea country values from publicly available sources
- Specific studies including ethnographic surveys and archaeological heritage assessments
- Consultation with First Nations groups and individuals

The process for identifying First Nations groups who may have interests and connection in Sea Country are set out in Section 4.9.1.3 and Section 5.8. The scope of advice Traditional Custodians were encouraged to provide through ethnographic surveys (see Section 4.9.1.5.2) or through project consultation was not limited by reference to any particular boundaries or limits of Sea Country.

4.9.1.5.1 Desktop Assessment of Sea Country Values

Cultural features and heritage values identified in publicly available literature

Publicly available sources were assessed for any records of previously identified Sea Country values or cultural features that may overlap with the Operational Area or EMBA. Where cultural features or Sea Country values were identified these are summarised in Table 4-24 according to the First Nations groups (where identified or inferable) who hold these values.

All cultural features and heritage values restricted to onshore locations above the highest astronomical tide (HAT) or inland waters have been excluded in Table 4-24. This is on the basis that the Operational Area does not intersect onshore sites (~30 km from Dampier), while the EMBA is predicted to extend up to HAT where there is shoreline contact (above thresholds at outer islands of the Dampier Archipelago (Lady Nora Island, Brigadier Island, Legendre Island and Cohen Island) and at Barrow Island). Where the geographical extent is not specified or unclear it has been included for completeness.

Table 4-24: Cultural features and heritage values identified in publicly available literature

First Nations Group	Features and Values	Source	Potential for overlap	
			Operational Area	EMBA
Gnulli (Baiyungu, Thalanyji, Yinggarda)	Feature: resources including marine animals. Value: traditional knowledge holds that ancestors live on the land and in the water. Therefore, people have obligations to access and care for these places (e.g., keeping them clean).	Peck on behalf of the Gnulli Native Title Claim Group v State of Western Australia [2019] FCA 2090	Possible (unspecified) Possible (unspecified)	Possible (unspecified) Possible (unspecified)
	Feature: heritage sites in the Ningaloo region include shell middens, artefact scatters, skeletal material/burial sites, camps, meeting places, hunting places and water sources. Feature: resources including gajalbu (emu), bundgurdi (kangaroo), bardurra (bush turkey), majun (marine turtles), turtle eggs, bilygurumarda (osprey), fish, shellfish and plants. Feature: mudflats, mangroves and sand dunes provide a critical breeding ground for marine and terrestrial wildlife. Value: the Ningaloo region contains cultural heritage dating back at least 32,000 years, including ceremonial Thalu sites.	DBCA 2020	No Possible (turtles, fish) No (other resources) No No Possible (unspecified)	Possible (Shoreline accumulation areas) Possible (turtles, turtle eggs, fish, shellfish) No (other resources) Possible (mangroves) Possible (unspecified, but likely refers to onshore areas outside the EMBA) Possible (unspecified, but likely due to location of EMBA)
	Value: connection to Country is important to the Traditional owners' spirituality and religion. Value: caring for Country - "The southern coastal reserves along the Ningaloo Coast are jointly managed by Traditional Owners and the DBCA. The Joint Management Body ensures that the Traditional Owners have an opportunity to make decisions about environmental management and land use". This document also includes information that is marked that cannot be copied, reproduced or used without consent.		No	Yes
	Feature: resources including mangrove crabs, gastropods, shellfish, dugong, turtle.	Morse 1993.	Possible (turtles, dugong) No (other resources from a cultural context)	Possible (all)
Kariyarra	Value: traditional knowledge recalls that a salt water serpent lives in the sea and brings fish to shore	Zaunmayr 2016	Possible (unspecified)	Possible (unspecified)

Cultural features and heritage values identified in other assessments

In addition to publicly available literature, Woodside has reviewed its own publicly available Cultural Heritage Management Plan (CHMP) which was developed in consultation with MAC for the nearshore installation of the Scarborough trunkline. The CHMP identifies a list of features which may hold heritage values. Not all features on this list, included in Table 5-7 of the CHMP, exist in the area relevant to the CHMP or in the EMBA for this EP.

The features listed in the CHMP include, at the highest level:

- A Tangible Heritage
- B Ethnographic sites
- C Intangible Heritage
- D Heritage Landscapes
- E Features with National Heritage Values
- F Features with Outstanding Universal Values
- G Submerged heritage
- H Features with values to neighbouring groups

Features described by items A to G are discussed for the purposes of this EP elsewhere in Section 4.9.1. Item H in the CHMP recognises that Traditional Custodians of Country beyond Murujuga may hold values such as those in items A-G. Given the scope of relevant persons considered under this EP (relevant persons consulted in the course of preparation of this EP have interests in the EMBA which extends well beyond Murujuga), the distinction between cultural heritage on Murujuga and beyond Murujuga is not considered meaningful. Where features were noted to exist in or near the area relevant to the CHMP, Table 4-17 below considers their relevance to the EMBA.

Table 4-25: Values identified in the Scarborough Cultural Heritage Management Plan (Woodside 2023b)

Feature		Identification in the CHMP	Relevance to the EMBA
A.1.a	Petroglyphs	Noted onshore only.	The EMBA overlaps the Ancient Landscape where these features may exist.
A.1.b	Artefact scatters	Archaeological assessment of the submerged landscape (UWA 2021) assessed the likelihood of impacting potential archaeological Indigenous heritage such as artefact scatters/middens in the nearshore or offshore Development Envelope as low to nil.	The EMBA overlaps the Ancient Landscape where these features may exist.
A.1.d	Middens		
D.3	Submerged calcarenite ridges	Calcarenite features at the edge of the continental shelf are young enough that they may include artefacts, but these features are covered by modern sediments and marine growth, and the trunkline will be installed over this. These calcarenite ridges will be crossed by the trunkline.	Exists within EMBA
A.1.b.i	Site 19675 (Tool Shed)	Noted onshore only.	Outside of EMBA
B.1	Features with spiritual values	It was concluded that ethnographic sites with spiritual values exist outside	No ethnographic sites have been identified within the EMBA.

Feature		Identification in the CHMP	Relevance to the EMBA
B.2	Features with social/cultural values	of the Development Envelope (Mott 2019, McDonald and Phillips 2021). No impacts from the Project to ethnographic sites were foreseen during these consultations. It was concluded that ethnographic sites which may have social and cultural values exist outside of the Development Envelope (Mott 2019, McDonald and Phillips 2021). No impacts from the Project to ethnographic sites were foreseen during these consultations.	
B.1.a	Songlines	It was concluded that ethnographic sites and features connected to songlines exist outside of the Development Envelope (Mott 2019, McDonald and Phillips 2021). No impacts from the Project to ethnographic sites were identified during these surveys. Woodside notes that trunklines and other infrastructure including shipping channels already exist in close proximity to the proposed trunkline route, and if there were to be any impacts to surviving songlines these would be significantly more likely to be described as qualitative (i.e. “weaken” a songline) rather than binary or absolute (i.e. destroy a songline).	Areas identified in the CHMP with connection to songlines or stories were limited to onshore locations and islands not included within the EMBA.
C.1.b	Stories		
B.2.a	Places for which access must be preserved	Noted onshore only.	Limitation of access is a relevant consideration within the EMBA.
C.1	Living culture	The continuous living culture of Murujuga is a component of the Outstanding Universal Values proposed as a justification for World Heritage Listing.	Ongoing access, connection to Country and transfer of knowledge are relevant considerations for the EMBA
C.1.a	Customs	Consultation with MAC has identified concerns about the movement of rocks to and from Country as requiring consultation with representatives of other areas.	Relevant consideration for PPA where rocks are locally sourced. Not relevant to internationally sourced rocks.
C.2.a	Animals of medicinal/food/economic value	Miscellaneous values as identified in MAC 2021.	The relevant values of MAC 2021 are considered in Section 4.9.1.5.3.
C.2.c	Plants		
C.2.c.i-vi	Plants (misc values)		
D.1	Conservation zones	Noted onshore only.	Outside of EMBA
D.4	Submerged hills	Archaeological assessment of the submerged landscape (UWA 2021) identified submerged hills which may have archaeological or other heritage values.	Exists within EMBA

Feature		Identification in the CHMP	Relevance to the EMBA
D.5.a	Rivers	<p>Archaeological assessment of the submerged landscape (UWA 2021) identified a submerged river which may have archaeological or other heritage values but confirmed that the trunkline does not cross this feature.</p> <p>Review of SSS data (Nutley 2022b) concluded that “In the middle shelf and outer shelf there were no indicators of former riverbeds, creek lines or lakes with which [any archaeological] feature may be associated.”</p>	The EMBA overlaps the Ancient Landscape where these features may exist.

4.9.1.5.2 Studies of Cultural Features and Heritage Values

First Nations Archaeological Heritage Assessment

Woodside understands that communal cultural connection may exist between Traditional Custodians and land and waters. It is understood from the onshore archaeological record that First Nations people have occupied the Australian continent for at least 65,000 years (Clarkson et al 2017) and in many places maintain a strong continuing connection that is said to extend back in First Nations cosmology to the beginning of time.

It is understood that the sea level has risen significantly during the 65,000 years of First Nations occupation, and areas that were once inhabited are now submerged on the continental shelf (Veth et al 2019; UWA 2021). Woodside also understands that, at its lowest level during First Nations occupation, sea level was between 125 m (O’Leary et al 2020, Veth et al 2019, Williams et al 2018) and 130 m below current levels (Benjamin et al 2020, Benjamin et al 2023, UWA 2021). Archaeological material preserved on the Ancient Landscape has the potential to provide further information about the earliest periods of human occupation (Veth et al 2019; UWA 2021).

Recent archaeological discoveries demonstrate that the now submerged landscape was occupied and inhabited, and can retain archaeological material from this time (Benjamin et al, 2020; Benjamin et al 2023; see Ward et al 2022 for an opposing view).

In recognition of this, Woodside considers the Ancient Landscape between the mainland and the Ancient Coastline KEF (see Table 4-19) as an area where potential First Nations archaeological material may exist on the seabed, as this covers the full extent of this possible First Nations occupation. The Operational Area intersects part of the Ancient Landscape but also extends beyond the furthest extent of the Ancient Landscape.

Archaeological material on the Ancient Landscape is a relevant matter for the proposed activity given the overlap, and potential for seabed disturbance related to planned trunkline installation activities and therefore potential for impacts to archaeological material. Woodside undertakes desktop assessments of archaeological potential, based on geophysical and bathymetric data, for any seabed disturbance at depths of less than 130 m. These assessments did not identify any archaeological sites or values in Commonwealth waters that may be impacted by the Petroleum Activities Program.

Known First Nations heritage places including archaeological sites may be protected subject to declarations under the *Aboriginal and Torres Strait Islander Heritage Protection Act 1984*, *Underwater Cultural Heritage Act 2018* or EPBC Act 1999. However, these Acts only extend protection to First Nations heritage places specified by declaration or otherwise included on a statutory list. Woodside understands that there is no First Nations archaeology known to exist anywhere within Commonwealth waters and no areas subject to declarations or prescriptions under these Acts are located within the EMBA.

For this EP, a search of DPLH's Aboriginal Heritage Inquiry System was undertaken, which showed 54 Registered Aboriginal Sites and 40 Other Heritage Places in the EMBA (see Appendix H).

Woodside has conducted extensive assessments described below (along with consultation) to adequately understand and describe the existing environment. However, if relevant new information on cultural values is received, it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.6).

Where First Nations archaeological material is identified within the EMBA, Woodside will discuss the management of this material with appropriate Traditional Custodian group(s), starting with any adjacent Native Title Body Corporate.

Existing Research and Desktop Assessment

In Australia until recently, the consideration of submerged archaeological sites has generally focused on the sub-discipline of maritime archaeology with connection to Australian Indigenous archaeology through studies of Indigenous fish-traps, whaling stations and shipwreck survivor camps. However, with the exception of Indigenous fish traps in intertidal zones, the consideration of Indigenous heritage sites submerged by post-glacial sea-level rise has only recently been considered (Mott, 2019).

There has been long and continuous occupation of the coastal Pilbara region as evidenced by scientific studies (Balme et al., 2009; McDonald et al., 2018; Veth et al., 2017). Petroglyph motifs feature a range of subject matter with many examples depicting extinct fauna and early stylistic techniques (McNickle, 1984; McDonald, 2005; Mulvaney, 2009, 2010, 2013).

In order to assess and define potential for preservation of submerged Late Pleistocene and Holocene sediment bodies that may contain preserved archaeological deposits, modelling on continental shelf development in the Dampier Archipelago has been undertaken. Analysis and modelling between the Last Glacial Maximum, through the Holocene marine transgression and up to the present day has shown that archaeological materials, if present, would most likely be evident in deposits associated with the early phases of inundation of the Dampier Archipelago, dating from around 9 to 7 ka before present (BP) (Ward et al., 2013). In contrast, the study proposes that coastal archaeology older than about 12 ka BP, when the post-glacial sea levels were below about 50 m, will have been exposed to a phase of faster tidal currents on the continental shelf, and hence eroded or poorly preserved (Ward et al., 2013). These areas of hypothesised lower preservation potential includes most of the Operational Area relevant to this EP (See Table 3-3).

A paper examining terrestrial analogy as a predictive tool for targeting submerged archaeological sites, provides several key elements to consider when examining the potential for identifying and managing submerged Indigenous heritage sites (Veth et al., 2019). Analysis of more than 2,500 known archaeological sites from the Dampier Archipelago reveals that the vast majority are rock art sites, but these are interspersed by a significant number of artefact scatters, myriad stone structures, shell middens, and quarry and reduction areas. The majority of these sites are focused on coastal and interior valleys, associated uplands, and coastal embayments. While over two thirds of sites occur on granophyre and basalt substrates, the others are located on quaternary sediments. Regional research on nearby continental islands shows that use of these environments can be expected to pre-date sea-level rise (Veth et al., 2019).

Through the Deep History of Sea Country (DHSC) project, researchers undertook a systematic and hierarchical approach to underwater investigation of the submerged landscapes at Murujuga (Dampier Archipelago). The researchers looked at the previously recorded Indigenous heritage sites from terrestrial surveys and used principles of geological, geomorphological and environmental associations to extrapolate to submerged landscapes. Where possible, the research considered submerged landscape principles as comparable but recognised that a range of factors may affect direct comparisons. A major constraint to any comparative studies is the shortage of marine stratigraphic, paleo-environmental, or geochronological data, and thus comparisons were initially divided into hard (crystalline) rock and soft (sedimentary) rock contexts, with the relative age of a

potential site or deposit based on bathymetry (i.e., depth below modern sea level) and morphological setting. These essentially inform and delineate prospective target areas for broad-scale underwater mapping (Veth et al., 2019).

The sites considered most likely to survive inundation, based on the review of existing literature, were logically the more robust forms including:

- midden and artefacts within cemented dunes, relict water holes, and beach rock deposits
- quarry outcrops, extraction pits, and associated reduction debris in fine-grained volcanic outcrops
- curvilinear stone structures and standing stones sitting on volcanic pavements and jammed into volcanic rock piles
- lag deposits of artefacts and possibly midden on hardpan in suitable landscape contexts with good preservation conditions (e.g. shallow declination shorelines in sheltered passages of the inner archipelago or on the leeward side of hard-rock/fringing reef cause-ways adjacent to the outer islands)
- small overhangs and shelters with preserved deposits, facing away from the dominant wave and wind action. (Veth et al., 2019)

Geotechnical sampling along the proposed pipeline route has shown that sediments are predominantly comprised of soft silty sands and therefore those landforms other than the first are highly unlikely to be present along the pipeline alignment. Rocks such as the dolerites, gabros and other volcanic rocks on which Murujuga rock art is found are not present in the Operational Area.

Integrated Heritage Services was engaged by Woodside to conduct an Indigenous heritage desktop investigation and initial ethnographic consultations with Traditional Custodian representatives, for the offshore and landfall component of the project (Mott, 2019). Subsequent to the finalisation of Mott (2019), the conclusions of Veth et al (2019) were tested through direct inspection with DHSC divers which led to the discovery of two locations with Indigenous underwater cultural heritage (Benjamin et al., 2020) in Flying Foam Passage and Cape Bruigeres in State waters outside the EMBA. This conclusively demonstrated the potential for underwater cultural heritage (UCH) to exist on the NW Shelf and highlighted the need to assess the potential impacts of offshore developments on submerged heritage landscapes (UWA, 2021).

MAC was consulted during the development of the Scarborough Project (Nearshore Component) Dredging and Spoil Disposal Management Plan (DSDMP) which included Commonwealth activities for full activity context (e.g., trenching and spoil disposal; and borrow ground dredging and associated backfill) that are pertinent to this EP. As a part of the DSDMP consultation, MAC advised that DHSC had identified two areas considered “culturally prospective”:

The first is the Madeline [sic] Shoals, which... is formed of the same igneous geology as the other areas of the archipelago where sub-tidal archaeological sites have been found. The second area is a 3 km wide relict submerged paleo beach barrier system that extends across the northern entrance to Mermaid Sound, over which the proposed trunk line route passes. This is an area of hard grounds... with high potential to contain Aboriginal lithic materials cemented within the deposits.

Scarborough Pipeline Cultural Heritage Assessment (UWA, 2021)

Following the recommendations of Mott (2019), Woodside engaged with the DHSC project from mid-2019. Woodside subsequently engaged researchers from the then-concluded DHSC project based at the University of Western Australia (UWA) to assess the prospectivity for archaeological sites along the Scarborough pipeline route and adjacent areas, beginning at the Burrup Peninsula and ending at the edge of the continental shelf in consultation with MAC (UWA, 2021).

The UWA Indigenous UCH assessment along the proposed Scarborough Pipeline route developed a predictive model for the potential for UCH to be located within the submerged landscapes along the Scarborough trunkline route (UWA, 2021). The study concluded that the Scarborough pipeline route is likely to have “low to nil impacts” to Indigenous archaeological values across the project footprint in Commonwealth waters (UWA, 2021).

The middle shelf landscape crossed by the proposed pipeline was determined to be of very low or no likelihood of impact to Indigenous archaeological values and “The current development envelope is the preferred pipeline route within mid shelf” (UWA, 2021). The assessment noted that “The mid shelf is flat, relatively featureless and covered by a thick layer of recent marine sediments. The absence of definable landscape features, exacerbated by marine sediment cover observed along the 300m wide survey corridor makes this 30m wide pipeline development corridor low prospectivity for any residual, in situ, surface manifestations of Indigenous heritage” (UWA 2021). Two “low relief beach ridge and beach barrier features” that were identified were considered to predate the 65,000 years of scientifically verified occupation of the Australian continent and “Therefore, they are likely to have a low prospectivity for cultural heritage being captured in these durable surfaces at formation, and similarly low potential for subsequently deposited cultural material having survived initial inundation and subsequent marine pedogenic forces.” (UWA 2021). The assessment also identified within the EMBA “two mounds which are interpreted as low relief hills of an unknown geology, each more than 15km from the proposed pipeline envelope” (UWA 2021).

Although the outer shelf possesses a highly prospective cultural landscape, the assessment concluded “Scarborough pipeline development is likely to have nil to low impact on any potential heritage values and the current development envelope is the preferred pipeline route here” (UWA, 2021). Within the EMBA, “There are several locations at the outer edge of the continental shelf where the reconstructed submerged landscapes are assessed as having high potential for significant heritage being present... These high potential landscape features are especially notable to the north of the proposed pipeline. If submerged heritage was to be encountered here, it would be of high significance, and we have identified several sections of the route where this possibility is greater than elsewhere.” For clarity, the assessment also notes that “While there are landforms and features that were identified on the seabed as having a higher probability of hosting indigenous UCH and would benefit from direct observations via ROV/AUV, these have not been identified within the proposed pipeline route.” (UWA 2021) and “The current pipeline alignment avoids several higher value landforms which increased heritage sensitivity (i.e., karst depressions, tidal channels) in proximity to the pipeline.” (UWA 2021).

The EMBA also includes areas of the inner shelf where “development proposal is likely to have nil or very low impact on any places with heritage values. The identification of more prospective submerged landscapes across this inner shelf, make the current proposal the preferred pipeline route within Mermaid Sound.” (UWA 2021). The inner shelf includes “submerged barrier systems which outcrop at the seabed.” (UWA 2021). The assessment noted these were dated “between 80,000 to 130,000 years BP and 186,000 to 245,000 years BP. Given these early ages it is unlikely that these barriers formed as an active cultural landscape and therefore these are unlikely to be prospective for encapsulated archaeological evidence. While it is possible that people may have occupied these exposed landscapes at any time in the last 65,000 years, the absence of water or other attractors associated with these identified low relief limestone-ridge landscapes lowers this potential, while their exposed nature makes for low survival chances of artefactual deposits laid on these exposed hard surfaces” (UWA 2021).

The inner shelf includes “no palaeochannels, relict waterholes, clay pan features, or igneous rock outcrops – such as can be observed in other parts of the Dampier Archipelago –that have been identified as hosting or potentially hosting cultural heritage sites” (UWA 2021). While “The palaeochannels of the Maitland River and Nicoll River are identifiable on the seabed to the south of Enderby Island and the east of the Archipelago on the inner shelf... The proposed pipeline transects neither of these palaeochannels – nor any submerged mounds/hills (i.e., features of

potential mythological significance to the Ngarda ngarli) that can be identified from the bathymetric reconstruction.” (UWA 2021).

Side Scan Sonar Review (Nutley 2022)

At the request of MAC, a review of existing side scan sonar data for the Operational Area on the Ancient Landscape was undertaken by a maritime archaeologist (Nutley 2022), with a particular but not exclusive focus on submerged fish traps. Although the remote sensing data was not targeted specifically at underwater cultural heritage when originally collected, the review noted the data was sufficient to provide a platform for assessing features that may require further investigation (Nutley 2022). This review included the barrier systems identified in UWA (2021) in the mid- and inner shelf.

This review identified numerous clusters of depressions which are “certainly naturally occurring features” and “none of them appear to be archaeological in nature” but requested further advice on what these represented to better understand the landscape and whether these were permanent features such as karsts. Woodside considers from existing data and previous investigation that these depressions in sandy sediments are a result of marine life and moving fluids. The report concluded: “No indication of stone structures such as fish traps, or hut foundations could be detected in the inner reef, middle shelf or outer shelf areas. In the middle shelf and outer shelf there were no indicators of former riverbeds, creek lines or lakes with which such feature may be associated.” (Nutley 2022).

ROV Inspection of Barrier Systems (Nutley 2023a)

MAC requested that calcarenite ridges on the inner shelf be directly inspected where the trunkline would be installed in State Waters. This installation is subject to separate approvals outside this EP, although the EMBA for activities under this EP does extend into state waters. Direct inspection in these areas was completed by ROV with the participation of a qualified marine archaeologist and representative of MAC (Nutley 2023a). No instances of potential cultural heritage material were detected during these inspections (Nutley 2023a).

The investigation “confirmed the presence of the former calcarenite, coastal barrier ridgelines that would have been exposed prior to inundation following global warming and substantial melting of the icecaps” (Nutley 2023a). It was noted that any stone tools “would have been subject to tidal movements, currents and storm waves and to have been redeposited into the ravines and valleys between the ridges. The geodetic data for the area shows that such ravines and valleys are filled with post-inundation marine sediments of up to five or more metres in depth.” (Nutley 2023a). The assessment also found “No evidence of former waterways or subsea springs or river valleys were present at the surface of the seabed.” (Nutley 2023a).

Borrow Ground Underwater Cultural Heritage Assessment (Nutley 2023b)

In State Waters, impacts to Indigenous archaeological heritage are managed under the Scarborough Project Cultural Heritage Management Plan⁴ (Woodside 2023). Although activities in Commonwealth Waters are not managed under this plan, it does include a description of Borrow Ground activities at the request of Traditional Custodians. This plan notes that “Borrow ground dredging will be limited to marine sediments (i.e., will not impact the ancient land surface where people may have lived or travelled)”. As described in Section 3.9.4 this is due to the targeted depth of dredging within the Offshore Borrow Ground.

Archaeological assessment of the borrow ground was undertaken by a maritime archaeologist (Nutley 2023b) based on previous studies, available geophysical and geotechnical data, historical research and the nature of the proposed activities in the borrow ground. This assessment noted:

The assessed risk of impact to UCH arising from the proposed dredging within the borrow field is low. This risk rating has been determined through:

⁴ available online [Scarborough Project Cultural Heritage Management Plan](#)

Geophysical and geotechnical information that indicates a relatively uniform deposit of sandy sediments across the borrow field and consisting of 1-2 m depth of coarse sand above variably cemented calcarenite.

Currently available geophysical survey data does not identify any indicators for the presence of UCH, including pre-inundation landscapes, shipwrecks or other features with cultural associations.

The assessment concluded that there is a low risk of potential impact on UCH arising from the proposed dredging activities within the Offshore Borrow Ground. However, the assessment noted that full coverage of Offshore Borrow Ground is not currently available. An additional survey is considered in Section 6.10 to address this gap. Should the data or feedback identify new information on cultural values, it will be assessed and, where appropriate, Woodside will apply its Unexpected Finds Procedure (Section 7.7), engage the MAC Heritage Management Committee (Section 7.5) and implement the Management of Change and Revision process (Section 7.15).

First Nations Ethnographic Heritage Assessment

Ethnographic surveys are a form of heritage survey conducted by anthropologists or ethnographers to understand cultural features of heritage significance and heritage values within a landscape. This is distinguished from archaeological survey (which focusses on the material remains of human culture) and consultation (which is not confined to an assessment of heritage, is not limited to values of a landscape and may be conducted without an ethnographic methodology).

Ethnographic surveys are undertaken to identify Aboriginal cultural heritage sites and values that are identifiable as tangible and intangible elements that are important to the Aboriginal people of the State, and are recognised through social, spiritual, historical, scientific or aesthetic values, as part of Aboriginal tradition.

To achieve this, an ethnographic survey is undertaken with an Aboriginal person or persons who in accordance with Aboriginal tradition, holds particular knowledge about the Aboriginal cultural heritage and has traditional rights, interests and responsibilities in respect of the Aboriginal cultural heritage (Mott 2023).

Woodside seeks to undertake ethnographic surveys where planned impacts overlap an area where First Nations group has an established cultural jurisdiction over an area of land or sea. Cultural jurisdiction is essential to ensure ethnographic survey participants “in accordance with Aboriginal tradition, hold particular knowledge about the Aboriginal cultural heritage”, and may be established through a number of mechanisms, including prescription under heritage legislation (e.g. Local Aboriginal Cultural Heritage Services under the Western Australian *Aboriginal Cultural Heritage Act 2021*), recognition through the determination of Native Title rights, or through land access agreements including ILUAs or ILUA-like agreements.

Where ethnographic surveys are requested during broader consultation in which a relevant person articulates their cultural jurisdiction, Woodside will assess this request and, where appropriate, undertake surveys. Surveys may not be appropriate, for example, where another party has established cultural jurisdiction or an adequate ethnographic survey has already been carried out over the area.

As ethnographic surveys are dependent on the participation of traditional knowledge holders, it is not possible to meaningfully conduct ethnographic surveys proactively over areas for which cultural jurisdiction is not established or unclear.

To supplement understanding of the area subject to MAC’s cultural jurisdiction, Woodside commissioned ethnographic surveys in 2019 and 2020 to support the Scarborough Project (Mott 2019, McDonald and Phillips 2021). Woodside has committed to support MAC with further ethnographic work, but MAC has not yet elected to progress this work.

An ethnographic survey may determine both the tangible and intangible cultural heritage which may be associated with cultural features. Importantly, ethnographic surveys are only one tool in identifying

cultural features and heritage values; Woodside has supplemented this work with archaeological assessments described in Section 4.9.1.5.2 and extensive consultation with Traditional Custodians described in Section 4.9.1.5.3. Typical results from ethnographic surveys may include the identification of songlines, ceremonial places such as ‘thalu’ sites for managing environmental resources, or places where activities such as birthing, initiation or other significant activities are performed. As a form of heritage survey, distinct from more general consultation, surveys were limited to discussions of the relevant landscape. However, participants were not restricted in the types of tangible and intangible cultural heritage they were encouraged to identify.

Preliminary Desktop Assessment and Ethnographic Inspection (Mott 2019)

The 2019 survey was undertaken due to the potential planned impact of offshore, nearshore and onshore activities associated with the Scarborough project within the cultural jurisdiction of Ngarda Ngarli people, traditional custodians of Murujuga. The survey was conducted with members of all five Traditional Custodian groups of Murujuga (Mardudhunera, Ngarluma, Wong-Goo-Tt-Oo, Yaburara and Yindjibarndi) invited through Prescribed Bodies Corporate for Ngarda Ngarli people (including NAC and WAC) and MAC, who met on country with heritage consultants.

The aim of this aspect of the work was “to undertake an initial ethnographic site visit to consult with traditional owners to discuss the current research undertaken by others on submerged landscapes generally, and to seek specific feedback on the nature of the proposed pipeline plans including the pipe landfall area, adjacent to a significant Aboriginal heritage site” (Mott 2019). Participants were provided with a map of the Scarborough development (Figure 4-18) and asked to identify any values in the surrounding landscape.

No cultural features or heritage values were identified in the Operational Area or EMBA through this survey (Mott 2019).

Within the recommendations arising from this work, it was advised “If any deviations from the current Project Area footprints are made, addendum desktop heritage assessment and consultation with traditional owners should be undertaken.” The desktop component of Mott (2019) related to archaeological heritage, and subsequent archaeological assessments are described in Section 4.9.1.5.2.

Consultation with Traditional Custodians for the project, including to understand the broader cultural values of the Borrow Ground, have been undertaken as described in Section 4.9.1.5.3 and Section 5.

Ethnographic Consultation (McDonald and Phillips 2021)

The 2020 survey was undertaken due to the potential planned impact of offshore, nearshore and onshore activities associated with the Scarborough project within the cultural jurisdiction of Ngarda Ngarli people, traditional custodians of Murujuga. The survey was conducted by MAC as representatives of Traditional Custodians for the onshore and nearshore aspects of the Scarborough Project. MAC appointed their preferred heritage consultants to meet on Country with the MAC Circle of Elders to discuss the project and identify any cultural values (McDonald and Phillips 2021). The resulting report is owned by MAC and was approved by the Circle of Elders prior to being provided to Woodside. Representatives from the Mardudhunera, Ngarluma, Yaburara, Yindjibarndi and Wong-Goo-Tt-Oo Peoples—all five Indigenous groups represented by MAC (MAC 2022)—participated in this survey (McDonald and Phillips 2021).

The scope of works for this survey defines the purpose of this survey as follows:

The ethnographic consultation aims at providing an understanding of the cultural heritage values associated with the submerged landscape.

Specifically, the survey and reporting will provide Woodside understanding of the cultural values within the coastal, nearshore and offshore proposed Scarborough trunkline and associated works areas.

The scope of the assessment was informed by the Scarborough project's development footprint as provided in Figure 4-19 however a landscape-scale approach was undertaken, considering heritage values that may be identified by participants well beyond this footprint. No boundary was imposed on the participants, and participants were not restricted in the types of heritage value they were encouraged to identify. As an indication of the breadth of the cultural landscape that the survey considered, cultural features and heritage values were identified more than 60km from the development footprint.

Participants were shown an introductory video explaining the key parameters of the Scarborough project including the proposed pipeline (McDonald and Phillips 2021). The survey identified ethnographic sites onshore, but these are outside the Operational Area and EMBA and scope of this EP (McDonald and Phillips 2021).

It is not appropriate or practical to request Traditional Custodians to list all ethnographic values onshore which they have not identified as potentially impacted, however some identified in the report included stories related to Eaglehawk Island and several sites at Withnell Bay several kilometres from the project footprint in State waters, outside of the EMBA and exclusively onshore. Some of these sites have spiritual connections and songlines throughout the landscape including to Cape Preston and Depuch Island. It was not proposed in the report that the Project would pose any risk to these sites or values, which are located well outside the EMBA. It was noted that some traditional knowledge of ethnographic values may have been lost through the effects of colonisation generally, and as a result of the Flying Foam Massacre in particular (McDonald and Phillips 2021).

Future Ethnographic Surveys

McDonald and Phillips (2021) represents the findings of Phase I of a planned two-part ethnographic survey, and recommends that the Phase II ethnographic survey be initiated. The second phase goes beyond industry standard by engaging with neighbouring First Nations groups to identify potential ethnographic values that traverse traditional group boundaries. Per Appendix F, Table 1, Woodside has communicated its commitment to the Phase II survey to MAC on multiple occasions, is ready to progress these at MAC’s earliest availability, and believes it has taken all reasonable steps to progress the Phase II survey. MAC has not yet elected to progress this work.

Phase I of the ethnographic survey was run by MAC, and the scope of this survey required “Full recording and significance assessment. The consultant is to provide advice as to whether there are cultural values within and nearby the footprint area...” Discussion with MAC’s then CEO has confirmed that MAC do not consider that they have failed to deliver on this scope. The survey was conducted with members of MAC’s Circle of Elders, who are recognised as cultural authorities for Murujuga, and the final report was approved by the Circle of Elders prior to being provided to Woodside.

Therefore, Woodside understands the Phase I works to adequately describe and assess the cultural, spiritual, aesthetic and social values held by Traditional Custodians for the project area and surrounding land and seascape. Woodside does not consider the Phase II works to be necessary to the construction of the Scarborough Project.

Woodside has also conducted extensive engagement with appropriate representatives as determined by MAC over the course of several years as well as a number of neighbouring Indigenous First Nations groups and representatives as detailed in Section 5. As reported in Section 4.9.1.5.3,

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

this consultation with MAC has resulted in the detailing of cultural values beyond the heritage values that may be identified through ethnographic survey, and in greater detail than the results of ethnographic survey to date. On 21 July 2023, MAC advised by letter that MAC “have no concerns at this point in time” regarding the proposed activities subject to this EP.

Beyond MAC, no Indigenous group has articulated cultural jurisdiction over any area of waters subject to impacts from planned activities. BTAC has stated that their Sea Country extends “out to the vast islands off the coast of the Pilbara, including the Monte Bello Islands, Barrow Island, and the Mackerel Islands.” These locations are outside of the extent of planned impacts. A review of publicly available literature has been undertaken to seek clarity on the extent of Sea Country for Thalanyji people in Section 7.6 and has not identified any areas recorded as Thalanyji Sea Country which overlap the extent of proposed impacts.

Woodside has offered support, through ongoing consultation, for initiatives proposed by Traditional Custodians to record Sea Country values (see Program of Ongoing Engagement with Traditional Custodians, Appendix L).

Woodside engages in ongoing consultation throughout the life of an EP. Should feedback be received (including any relevant new information on cultural values from the Phase II survey or other sources), it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.7).

4.9.1.5.3 Consultation Feedback to Inform Existing Environment

Summary of values raised during consultation

A summary of the topics/interests and values raised by First Nations groups through consultations on this Petroleum Activities Program, or raised in context of general Scarborough Project activities or other activities are provided in Table 4-18.

First Nations cultural values are communally held. This is reflected in Vision 3 of Dhawura Ngilan that “Aboriginal and Torres Strait Islander heritage is managed... according to community ownership” (Heritage Chairs of Australia and New Zealand 2021). Dhawura Ngilan also specifically notes that “Aboriginal and Torres Strait Islander... intangible knowledge systems, which are held in songlines and language, are endangered. This knowledge is held by Elders and the community...” Through consultation Registered Native Title Bodies Corporate and nominated representative corporations have identified or raised topics relating to environmental values of cultural interest. Woodside recognises the deep spiritual and cultural connection to the environment⁵ that First Nations people hold.

The Program of Ongoing Engagement with Traditional Custodians (Appendix J) provides a mechanism for ongoing dialogue between Woodside and Traditional Custodians, beyond that required by regulation 11A. The program enables Woodside to manage the potential impacts and risks to cultural values which may be identified at any time during Woodside’s activities via ongoing dialogue with Traditional Custodians. As an example, Woodside is developing a framework for ongoing consultation with BTAC and other groups (Appendix J). Should feedback be received (including any relevant new information on cultural values), it will be assessed and, where appropriate, Woodside will apply its Management of Change and Revision process (see Section 7.15).

⁵Definition of ‘Environment’ in Regulation 4 of the OPPGS (Environment) Regulations are defined as:

- a) ecosystems and their constituent parts, including people and communities; and
- b) natural and physical resources; and
- c) the qualities and characteristics of locations, places and areas; and
- d) the heritage values of places; and includes
- e) the social, economic and cultural features of the matters mentioned in paragraphs (a), (b), (c) and (d)

Table 4-26: Feedback Received via Consultation to Inform Existing Environment Description

Relevant First Nation Group /Individuals	Consultation context	Description of Value / Interest	Potential for overlap	
			Operational Area	EMBA
BTAC representing some of the Gnulli native title claimants (Baiyungu and Thalanyji people)	Raised in context of general Scarborough Project activities	Value: Cultural obligation to care for the environmental values of sea country	Possible (unspecified)	Possible (unspecified)
		Sea country extends “out to the vast islands off the coast of the Pilbara, including the Monte Bello Islands, Barrow Island, and the Mackerel Islands”	No	Possible (unspecified)
Karajarri Traditional Lands Association	No values raised	-	-	-
Kariyarra Aboriginal Corporation	Raised in context of general Scarborough Project activities	Interest: Assertion of sea rights in native title claim area <i>Interpreted as general connection to country, assertion of rights to access country and cultural obligation to care for environmental values of sea country</i>	No	Yes
Kimberley Land Council (KLC)	No values raised	-	-	-
Malgana Aboriginal Corporation	Raised in context of general Scarborough Project activities	Interest: Shark Bay environment is unique and has the largest living organism in the world	No	No
		Feature: Stromatolites Interest: Shark Bay contains stromatolites and microbial mats which are amongst the oldest living in the world.	No	No
		Interest: Seagrass For Shark Bay Malgana Aboriginal Corporation stated that they had observed a nearly 25% loss of seagrass from a hypersaline discharge into the bay	No	No
Murujuga Aboriginal Corporation representing Ngarda-Ngarli people (Mardudhunera, Ngarluma, Wong-Goo-Tt-Oo, Yaburara and Yindjibarndi)	Raised in context of Nearshore Scarborough Project activities (MAC 2021 as cited in Woodside 2023)	Value: Mermaid Sound ecosystem health	No	Possible
		Feature: Whale Value: A whale Thalu is an increase at a totemic site that brings whales into beach	Possible (whale) Possible (unspecified)	Possible (whale) Possible (unspecified)
		Value: Whales and other species of totemic importance need to be protected, including their populations, biodiversity, and migration patterns	Possible (whales) Possible (unspecified; other species)

Murujuga Aboriginal Corporation cultural values of marine ecosystems

Murujuga Aboriginal Corporation (MAC) was consulted during the development of the Scarborough Project (Nearshore Component) Dredging and Spoil Disposal Management Plan (DSDMP)⁷ which included Commonwealth activities for full activity context (e.g., trenching and spoil disposal; and borrow ground dredging and associated backfill) that are pertinent to this EP. As a part of the DSDMP consultation, MAC proactively engaged the Circle of Elders to identify places, areas and values of the marine environment that are of cultural importance. MAC prepared a report titled “*Cultural Values of the Environment for Scarborough DSDMP*” which identified values of the marine environment that are of cultural importance to MAC. This work was an outcome of consultation further described in Section 5. This work is not considered an ethnographic survey, as it did not employ ethnographic survey methodology or the participation of a qualified anthropologist or ethnographer.

No specific environmental values of cultural importance were identified within the Trunkline Project Area (KP32 to KP50) or the Borrow Ground Project Area. Rather, values were identified within Mermaid Sound, which is directly relevant for the EMBA and for specific values can be inferred within the Operational Area (refer to Table 4-21).

Further Information regarding BTAC’s Sea Country values

During consultation, BTAC, on behalf of the Thalanyji People, advised it has a cultural obligation to care for the environmental values of Sea Country (refer to Appendix F, Table 1).

In correspondence from 20 February 2023 relating to the Scarborough Project, BTAC advised that:

- BTAC seeks support from Woodside to enable BTAC to define and articulate its values on Sea Country in a manner that could be more clearly understood by the offshore sector, government, and the community. This would enable BTAC and Woodside to collaborate to develop effective management plans that can provide adequate protection to Sea Country values; and
- BTAC seeks support from Woodside to obtain technical support to review the information and provide BTAC and its members with feedback on the project risks to Sea Country and help BTAC contemplate the potential management controls that could be developed to protect its values and interests

These requests do not constitute a request for ethnographic survey. Woodside has agreed to BTAC’s request, and the resulting offer of technical support is detailed in Appendix F, Table 1. However, Woodside’s offer for technical support has not yet been accepted.

BTAC noted that this Sea Country extends “out to the vast islands off the coast of the Pilbara, including the Monte Bello Islands, Barrow Island, and the Mackerel Islands.” In the absence of further advice from BTAC, Woodside understands from this description that BTAC’s interests extend to the Montebello Marine Park Multiple Use Zone in the vicinity of the islands.

While an ethnographic survey has not been requested, a review of publicly available literature has been undertaken to seek clarity on the extent of Sea Country for Thalanyji people. This review identified a number of heritage research projects undertaken for the Montebello and Barrow Islands which acknowledge the support of BTAC (e.g., Manne and Veth 2015, Veth et al. 2017), though no information regarding Sea Country values, or the extent of Sea Country, were identified.

Publicly available heritage assessment reports elsewhere on Thalanyji Country tend to rely on established native title boundaries (e.g., Chisholm 2013) or draw on historic maps, particularly those compiled by Norman Tindale and published in 1947 (e.g., Hook et al. 2020).

An early 1940’s map by Tindale shows “Talaingji” (Thalanyji) Country as exclusively terrestrial and further west than areas typically recognised today as Thalanyji Country (Tindale 1940). This map also shows the Noala people as custodians of the Onslow area and defines Barrow and the

⁷ available online [Scarborough Project \(Nearshore Component\) Dredging and Spoil Disposal Management Plan](#)

Montebello Islands as “Mardudunera” (Mardudhunera) Country—it is unclear from the map if the boundary of Mardudhunera is proposed to represent an extent of Sea Country, or merely note that these islands are part of Mardudhunera Country.

A further refined version of this map was produced in 1974 which shows “Talandji” in a location more closely aligned with contemporary understanding of Thalanyji Country and removes the apparent extent of Mardudhunera over Barrow and the Montebello Islands (Tindale 1947). This definition of Thalanyji Country is still confined to the mainland in this map.

A more contemporary attempt at mapping traditional country is shown in The AIATSIS Map of Indigenous Australia (Horton 1996). This map similarly confines Thalanyji Country to terrestrial areas west of Onslow and leaves Barrow and the Montebello Islands unmarked as an area with “No published information available”. It is also noted that “This map is based on data collected up to 1994 and is not intended to show precise areas or boundaries” (Horton 1996).

Collective assessments of Sea Country in the Pilbara (Lincoln and Hedge 2019, YMAC et al. 2010) were also found to rely on existing native title boundaries. It is noted in the Pilbara Sea Country Plan (YMAC et al. 2010) that:

Although some differences remain, between and among native title groups, there is now a general sense that most groups have coalesced into final forms that will, in future, be the groups that exercise rights and interests in their respective areas. many of these rights and interests will relate directly to native title. however, there is also a more broadly based appreciation of the need to accept and discharge responsibilities for land and marine management within native title areas regardless of whether native title per se is affected. (YMAC et al. 2010, emphasis added).

The office of the Registrar of Indigenous Corporations records four corporations using the name Thalanyji:

- Buurabalayji Thalanyji Aboriginal Corporation
- Buurabalayji Thalanyji Aboriginal Corporation RNTBC
- Onslow Thalanyji Aboriginal Corporation
- Wurrumalu Thalanyji Aboriginal Corporation

The only currently operative organisation, and the only organisation with an identified website, is Buurabalayji Thalanyji Aboriginal Corporation RNTBC. This website states that “Thalanyji Country spreads out across the Ashburton River coastal plain south to Tubridji Point, then across to Yannarie River and upstream to Emu Creek, across the range hills of southwest Pilbara to Henry River and Cane River in the north.” (BTAC 2021) This description includes coastal areas but provides no description of the extent of Sea Country.

A search of the National Native Title Tribunal register of applications and determinations identified four historic Native Title claims with the name Thalanyji:

- Thalanyji People (WC1995/002)
- Thalanyji People #2 (WC1996/082)
- Thalanyji (WC1999/045)
- Thalanyji 2 (WC2010/004)

Most of these claims were dismissed, and Woodside makes no assessment of the merits of these claims.

The area of WC1995/002, as defined in the map forming Attachment 1 to the Native Title Application,⁸ does not include any areas of Sea Country.

WC1996/082 does not include a publicly available map on the National Native Title Tribunal website. The Native Title Application⁹ does describe the area covered by the claim, including "This country extends from the Tubridji Point on the coast south west of Onslow and tracking south to Yanarrie River." and "The area also includes the waters and associated islands between Tubridji point and Cane River. These islands were visited by Thalanyji People." The extent of this Sea Country from the coast is unclear, but would presumably include islands as distant as Airlie Island, approximately 30 km from the shore.

The area of WC1999/045, as defined in the map forming Attachment C to the Native Title Application,¹⁰ includes an area of water extending approximately 30 km from the mainland coast in encompassing a number of islands, including:

- Airlie Island
- Ashburon Island
- Bessieres Island
- Direction Island
- Flat Island
- Locker Island
- Round Island
- Serrurier Island
- Table Island
- Thevenard Island
- Tortoise Island, and
- the Twin Islands

The area also includes the south-most of the Mangrove Islands, but does not include the other Mangrove Islands.

The area of WC2010/004, as defined in the map forming Attachment C to the Native Title Application¹¹ includes localised areas of sea up to approximately 5 km beyond the coast.

Woodside has developed a robust understanding of Thalanyji Sea Country cultural values and heritage features through publicly available information (Section 4.9.1.5.1) and consultation with BTAC under Regulation 11A. Woodside considers that it has taken all reasonable and practicable steps to identify cultural features and heritage values of Thalanyji people in the EMBA.

If further guidance from BTAC is received as part of ongoing consultation which changes Woodside's understanding of the extent of Thalanyji Sea Country, Woodside's Management of Change and Management of Knowledge process with EPO 28 will be applied to manage potential impact to newly identified cultural values or features to ALARP and Acceptable levels. This estimation does not limit

the extent of consultation with BTAC or the features and values they are encouraged to identify and communicate.

4.9.1.6 Summary of cultural features and heritage values

Woodside has developed a robust understanding of cultural features and heritage values relevant to the activity through examination of publicly available information, studies and consultation with relevant persons under regulation 11A.

Table 4-18 consolidates the cultural features and heritage values identified in Section 4.9.1.6 and confirms whether there is any potential for these to exist within the Operational Area or EMBA. As previously described topics which have been raised in the context of an interest linked to the natural environment are impact and risk assessed in Section 6.7 and 6.8.

As cultural features are physical elements of a place, these can generally be assessed for impacts; where a feature is avoided, it is not impacted. Heritage values relate less to what is significant and more to why something is significant; interaction between heritage values and the Operational Area can only be reliably informed by consultation with Traditional Custodians where they are willing to share the necessary knowledge. Assessment of heritage values beyond cultural features alone is addressed in Section 6.10 subject to these caveats.

Table 4-27: Summary of cultural features and heritage values

Identified cultural features and heritage values	Context	EP Source				Potential for overlap	
		Consultation Feedback	Indigenous Archaeological Heritage Assessment	Ethnographic Heritage Assessment	Desktop Literature Assessment	Operational Area	EMBA
Archaeological Heritage and Landscapes							
Coastal/ island archaeological sites	Coastal archaeological sites include shell middens, artefact scatters, skeletal material/burial sites, camps, meeting places, hunting places and water sources.	✓	✗	✓	✓	No	Possible (shoreline accumulation only)
Petroglyphs	Petroglyphs are a form of rock art. Petroglyphs are a prominent feature particularly at Murujuga where it is found on hard, volcanic rock.	✓	✗	✓	✓	No	Possible (submerged)
Fish traps	Stone arrangements constructed in intertidal areas which fill with fish at high tide and trap them at low tide/	✓	✓	✗	✓	No	Possible (submerged)
Submerged archaeological sites	The Ancient Landscape extends between 125m and 130m below current sea level. Ancient occupation of this area may have left traces through now submerged archaeological sites.	✓	✗	✗	✓	Possible albeit unlikely (borrow ground only)	Possible
Rivers, waterholes, tidal channels and seeps	Water sources on the Ancient Landscape which may be culturally significant or archeologically prospective. Traditional knowledge retains knowledge of some water sources on the Ancient landscape and some submerged waterholes are related to a Kangaroo songline.	✗	✓	✗	✓	No	Known to occur

4.9.1.6.1 Further context: Archaeological heritage

Assessment of the Operational Area has not identified archaeological sites. Consultation with Traditional Custodians has not identified any Aboriginal cultural features or heritage values specifically associated with the trunkline route and Offshore Borrow Ground in Commonwealth Waters. The assessment of the Offshore Borrow Ground concluded that there is a low risk of potential impact on UCH arising from the activity. However, the assessment noted that full coverage of Offshore Borrow Ground is not currently available. As such, an additional survey is considered in Section 6.10 to address this.

No coastal areas or islands exist within the Operational Area. Islands do exist within the EMBA boundary, however given the EMBA is driven by an unplanned marine diesel spill there is no anticipated impact pathway from this activity to onshore archaeological sites above highest astronomical tide (HAT). No archaeological sites have been identified beyond terrestrial or intertidal areas, with the exception of two sites at Murujuga in Cape Bruguieres channel and Flying Foam Passage (Benjamin et al. 2020; Benjamin et al 2023), which are outside of the EMBA. However, it is recognised that there is the potential for submerged archaeological sites on the Ancient Landscape which is overlapped by the EMBA.

Archaeological sites identified onshore with the potential to exist in intertidal or submerged locations include petroglyphs, fish traps and artefact scatters or burials contained within sand dunes. As archaeological sites, these features have archaeological value which relates to the preservation of their fabric (i.e. the tangible features) and their context (i.e. their location and relationship to other archaeological and natural features). Archaeological sites may also have intangible dimensions (ICOMOS 2013) cultural value that exist in addition to their archaeological or scientific value and are assessed separately.

Certain landscapes have been identified as archaeologically prospective on the submerged Ancient Landscape, including:

- submerged water sources (rivers, waterholes, tidal channels and seeps) which have an increased likelihood of use or habitation as past generations used the associated resources (UWA 2021).
- submerged calcarenite ridges younger than human occupation of the continent which may have formed over and protected artefacts in situ (Veth 2019),
- prominent landscape features (e.g. hills, particularly of igneous rock formations) that may have been foci for cultural activity (UWA 2021),
- Karst depressions and other “catch points” where artefacts may accumulate following disturbances caused by inundation (UWA 2021, Nutley 2022, Nutley 2023a).

Madeleine Shoals has been specifically identified by MAC as a prospective due to its igneous rock formations which have the potential to contain petroglyphs.

4.9.1.6.2 Further context: Intangible cultural heritage

Intangible cultural heritage has been identified through consultation with First Nations people as culturally important (refer to Section 4.9.1.5.3). Cultural knowledge, as expressed through songlines, dreaming, dance and other cultural practices, can be associated with tangible objects and physical sites that are culturally important to First Nations people (Ardler 2021; Bursill et al. 2007). Intangible cultural heritage can also be embodied in the practices, representations, expressions, knowledge, uses and skills associated with physical sites (UNESCO 2003). As a result, physical features may have intangible dimensions (ICOMOS 2013).

In terms of identified cultural features and heritage values related to intangible values summarised in Table 4-27, see below some additional context:

- **Songlines:** Oral Songlines are often described by First Nations people as the law of the land and make up part of the Dreaming (Neale and Kelly 2020:30). Songlines are viewed in Western academia as a framework for relating people to land and consist of a series of invisible, interconnected routes across the landscape that mark significant sites for First Nations people (Higgins 2021:723). Songlines demonstrate First Nations peoples' strong connections to land by revealing sacred knowledge that is place-specific (Roberts 2023:5). The land's physical features are instrumental in maintaining songlines because this is how ancestral spirits journeyed through, and interacted with, the physical landscape leaving sacred knowledge behind. The interconnection between the physical and spiritual is where songlines become intrinsically tied to significant places across Country. As a result, geographical landforms are recorded within songlines and become sacred places. Such landforms can include inter alia: rocks, mountains, rivers, caves and hills (Higgins 2021:724). Songlines can become lost, fragmented or broken when there is a loss of Country or forced removal from Country (Neale and Kelly 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge.

In Australia, songlines can stretch thousands of kilometres, making up a complex and organic network of stories containing cultural knowledge of First Nations communities across the land (Neale and Kelly 2020:35). Songlines can also extend out to Sea Country and contain cultural knowledge that is tied to geographic features, atmospheric phenomena and marine plants and animals. Often songlines containing references to a seascape or Sea Country make mention of mythical events occurring around marine life, fishing areas, submerged rocks or coral. Songlines that embody seascapes can reflect how a group may relate to, or value, Sea Country—for example connections to nearby islands that they once inhabited in their songlines (Smyth and Isherwood 2016:307). Songlines can also be used as proof of long-standing connection to land and support a legal entitlement to land rights (Higgins 2021:74). Examples where songlines contain strong references to Sea Country are more common in Pacific Islander and Torres Strait Islander communities, who often refer to seascapes and skylines in their songlines in order to communicate sacred knowledge that assists in safe navigation of the ocean (Neale and Kelly 2020:83-84). The routes of any songlines in the EMBA have not been provided by Traditional Custodians through consultation.

- **Creation/dreaming sites, sacred sites and ancestral beings:** The only sources located by Woodside with detailed descriptions of the location ancestral beings or creation/ dreaming/ sacred sites placed these on land or within inland water sources such as rivers or pools. However, some ancestral beings are noted to live within or originate from the sea generally, and some creation stories talk to the creation of features from or in the sea. Additionally, every place on shore or at sea must be assumed to have been created on some level in First Nations cosmology.
- **Cultural obligations to care for Country:** Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. In the literature reviewed by Woodside, caring for Country was noted to include, but is not limited to, maintenance of the physical environment and ecosystem. It may also have cultural, spiritual and ritual dimensions such as caring for ancestral beings or ensuring cultural safety. Thalu are places where increase ceremonies are performed to enhance or maintain populations of plants, animals or phenomena. All mentions of active ceremonial sites were confined to onshore locations, though the values may extend offshore where e.g., a thalu relates to marine species populations.
- **Knowledge of Country/customary law and transfer of knowledge:** Knowledge of and familiarity with the features of Sea Country is itself a value. The inherent potential for restricted or secret knowledge makes this difficult to assess even through consultation with Traditional Custodians. However, aspects such as limitations on access to sites or disruption/relocation of First Nations communities may have implications for the preservation of First Nations knowledge. Further,

connection to Country may be damaged where people are displaced or disrupted (e.g., during colonisation) or where there is a loss of technical skills or environmental knowledge (McDonald and Phillips, 2021). Transfer of knowledge includes continuing traditional practices to pass on practical skills. This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

- **Connection to Country:** Describes the multi-faceted relationship between First nations people and the landscape, which is envisioned as having personhood and spirit. It is also an aspect of personal identity for many First nations people. In the case of Sea Country this can mean identifying as a Saltwater person, where “essence of being a 'Saltwater' person is ontological... it is about how people relate spiritually to the sea and engage with spiritual forces that created it, the marine flora and fauna and people” (McDonald and Phillips, 2021).
- **Access to Country, including Sea Country:** Is necessary for the continuation of other values including caring for Country and the transfer of traditional knowledge. Being on Country can be an important way of expressing or maintaining connection to Country (Australian Indigenous HealthInfoNet n.d.). Access is also a value in its own right, as a continuation of traditional Sea Country access and use.
- **Kinship systems and totemic species:** Individuals may have kinship to specific species (Smyth 2008, Juluwarlu 2004) and/or a responsibility to care for species (Muller 2008). Kinship arises from totemic associations within First Nations “skin group” systems. It is forbidden for an individual to kill or eat a species who is from the same “skin group” (Juluwarlu 2004). They may also have certain obligations linked to the discussion of caring for Country below. It is assumed that marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that “skin group” from hunting or eating that same species (Juluwarlu 2004).
- **Resource collection:** A number of marine species are identified through consultation and literature as important resources, particularly as food sources. In addition to their immediate value as sustenance, the gathering and preparation of these resources is informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations.

4.9.1.6.3 Further context: Marine ecosystems and species

First Nations people have raised through consultation that they have a general interest in environmental management and ecosystem health (i.e., natural environment interest), where a group/individual was seeking further information about potential impacts and risks from the Petroleum Activities Program on marine species and benthic communities in the Operational Area and EMBA. This includes marine mammals, marine reptiles, fish, seabirds, plankton, benthic and shoreline habitats and marine parks, which are described in context of their distribution and populations in Section 4.5 and 4.6, with further details in Appendix I (Master Existing Environment).

In terms of identified cultural features and heritage values related to marine ecosystems and species summarised in Table 4-27, see below some additional context:

- **Marine mammals:** Whales, and in particular humpback whales, have been identified through consultation with First Nations people as culturally important species, with totemic importance including their populations, biodiversity, and migration patterns. Cultural ceremonies associated with communicating with dolphins have also been raised by MAC through consultation and dugongs predominantly as a resource. Details pertaining to whales, dugongs and dolphins, their distribution, migration patterns and populations are described in Section 4.6.3, with further details in Appendix I (Master Existing Environment).
- **Marine reptiles:** Turtles and sea snakes have been identified through consultation with First Nations people as culturally important species, with turtles identified as a resource. First Nations people that identify marine reptiles as species of totemic importance or integral to songlines may

place high cultural value on their protection. No marine reptiles-related songlines have been identified as per Section 4.9.1.6.2 that have the potential to interact with the PAA or EMBA. Note the only songline related to marine reptiles (turtles) was shared by MAC, and was geographically restricted from Fortescue to Withnell Bay, in Mermaid Sound (MAC 2021). Cultural knowledge of turtles at a population level (turtle migration, behaviour and the related marine environment) may all be important in ensuring the continuation of cultural functions and activities that remain valuable to First Nations people (Fijn 2021:47; Delisle et al.2018). Details pertaining to marine reptiles, their distribution, and populations are described in Section 4.6.2, with further details in Appendix I (Master Existing Environment).

- **Fish and Cephalopods:** Fish and squid have been identified through consultation with First Nations people as a culturally important species, with fish generally being identified as a resource. First Nations may identify cultural values associated with fish species as important to maintaining both tangible (physical cultural sites) and intangible (cultural knowledge) cultural heritage. Tangible cultural heritage associated with fish can include important cultural sites such as midden sites, fish traps and thalu sites. While the octopus is an important totem to Ngarla People and features in the creation story of Solitary Island. There are increase ceremonies / rituals for species of squid and octopus to enhance or maintain populations. Thalu are places where these increase ceremonies are performed. Details pertaining to fish and cephalopods are described in **Section 4.6.1**, with further details in Appendix I (Master Existing Environment).
- **Seabirds:** Seabirds, and in particular shags, have been identified through literature as a culturally significant species (Malgana Land and Sea Management et al. (2021), as well as a resource (seabird eggs; Smyth 2007). Details pertaining to seabirds and migratory shorebirds are described in Section 4.6.4, with further details in Appendix I (Master Existing Environment).
- **Benthic habitats:** Through consultation, First Nations groups identified benthic habitats as valuable for their ecological values, including corals attracting fish and seagrass providing shelters for fauna, as well as an important resource for dugongs. Additionally, coral is valued by MAC for its aesthetic values. Details pertaining to benthic habitats and communities, including their distribution, are described in Section 4.5.2, with further details in Appendix I (Master Existing Environment).
- **Shoreline habitats:** Through consultation, First Nations groups identified shoreline habitats as valuable for their ecological values, including mangroves for providing shelter to marine invertebrates, which are identified resources, and potential nursery for turtles. Literature also notes that mangroves are also valued for the flora and fauna they are associated with and support (Commonwealth of Australia 2002) and Smyth (2007) reports that mangrove seeds are used as a resource by Ngarda-Ngarli. Details pertaining to shoreline and coastal habitats, including their distribution, are described in Section 4.5.3, with further details in Appendix I (Master Existing Environment).

4.9.1.7 Historic Sites of Significance

There are no known sites of historic heritage of significance within the Operational Area. Appendix H describes heritage sites within the EMBA.

4.9.1.8 Historic Underwater Heritage

A search of the Australasian Underwater Cultural Heritage Database, which records all known Maritime Cultural Heritage (shipwrecks, aircraft, relics and other underwater cultural heritage) in Australian waters does not contain records of sites within the Operational Area, nor within 10 km of the Operational Area. The Montebello Marine Park contains two known shipwrecks protected under the Underwater Cultural Heritage Act 2018: the Trial (wrecked in 1622, the earliest known shipwreck in Australian waters) and Tanami (unknown date) (Director of National Parks, 2018).

A review of existing side scan sonar data for the Operational Area on the Ancient Landscape was undertaken by a maritime archaeologist (Nutley 2022), with a particular but not exclusive focus on submerged fish traps. Although the remote sensing data was not targeted specifically at underwater cultural heritage when originally collected, the review noted the data was sufficient to provide a platform for assessing features that may require further investigation (Nutley 2022).

This review identified numerous clusters of depressions which are “certainly naturally occurring features” and “none of them appear to be archaeological in nature” but requested further advice on what these represented to better understand the landscape and whether these were permanent features such as karsts. Woodside was able to confirm from existing data and previous investigation that these depressions in sandy sediments are a result of marine life and moving fluids.

Review of the Side Scan Sonar of the seabed along the trunkline route identified one feature that was initially considered a possible shipwreck but based on texture and sharpness of the image was ultimately assessed to be a natural feature. Review of this data did not identify any evidence of the recorded wrecks or other maritime heritage within the Development Envelope.

Archaeological assessment of the borrow ground was undertaken by a maritime archaeologist (Nutley 2023b) based on previous studies, available geophysical and geotechnical data, historical research and the nature of the proposed activities in the borrow ground. This assessment noted:

From the above analysis, the assessed risk of impact to UCH arising from the proposed dredging within the borrow field is low. This risk rating has been determined through:

Geophysical and geotechnical information that indicates a relatively uniform deposit of sandy sediments across the borrow field and consisting of 1-2m depth of coarse sand above variably cemented calcarenite.

Currently available geophysical survey data does not identify any indicators for the presence of UCH, including pre-inundation landscapes, shipwrecks or other features with cultural associations.

The assessment concluded that there is a low risk of potential impact on UCH arising from the proposed dredging activities within the Scarborough Trunkline borrow ground. However, the assessment noted that full coverage of multibeam echo sounder and sidescan sonar data is not currently available. Recommended mitigation measures were proposed to address this limitation and are assessed in Section 6.7.2.

4.9.1.9 World, National and Commonwealth Heritage Listed Places

No listed world, national or Commonwealth heritage listed places overlap the Operational Area, however several occur within the EMBA (Table 4-20) including:

- Ningaloo Coast (WHA)
- Shark Bay (WHA)
- Ningaloo coast (natural) (NHP)

- Dampier Archipelago (Indigenous) (NHP)
- Shark Bay (natural) (NHP)
- Ningaloo Marine Area – Commonwealth waters (CHP)
- Learmonth Air Weapons Range Facility (CHP).

Table 10-1 of Appendix H and the Scarborough OPP outline the values and sensitivities of these places.

The Murujuga Cultural Landscape was also added to Australia's World Heritage Tentative List in 2020 and the World Heritage nomination dossier was submitted for consideration in 2023. The boundaries of the cultural landscape, Outstanding Universal Values are yet to be finalised.

4.9.2 Commercial Fisheries

A number of Commonwealth and State fishery management areas are located within the Operational Area and EMBA. The Annual Fishery Status Reports published by the Australian Bureau of Agricultural and Resource Economics and Sciences (ABARES) were used to identify if Commonwealth managed fisheries have fished within the Operational Area and EMBA in the last 5 years. FishCube data were also requested from the WA Department of Primary Industries and Regional Development (DPIRD) for the most recently available 5-year period of fishery catch and effort data (2018-2022) to analyse the potential for interaction with State managed fisheries within the Operational Area and EMBA (DPIRD, 2022). Data was reviewed from the last 5 years as a subset of past fishing effort. This was deemed an appropriate period to represent potential future fishing effort over the lifecycle of this EP (4 year). In addition, any impacts to fish are expected to be temporary in nature (See Section 6.7 and Section 6.8) and therefore not extending beyond the life of the EP. This information was used to determine relevant fisheries for consultation who may be impacted by the proposed petroleum activities. Table 4-28 provides an assessment of the potential interaction and Appendix H and the Scarborough OPP provide further detail on the fisheries that have been identified through desk-based assessment and consultation (Section 5). Figure 4-20, Figure 4-21, and Figure 4-22 shows fisheries identified as having a potential interaction with the Petroleum Activities Program.

Table 4-28: Commonwealth and State commercial fisheries overlapping the Operational Area and EMBA

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Commonwealth Managed Fisheries			
North West Slope Trawl Fishery	✓	✓	The North West Slope Trawl Fishery management area overlaps the Operational Area and the EMBA. Fishery Status Report 2022 indicates current fishing effort is concentrated from Barrow Island to Broome, and occurred within the Operational Area and the EMBA (ABARES, 2021). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the Operational Area and EMBA.
Western Deepwater Trawl Fishery	✓	✓	The Western Deepwater Trawl Fishery management area overlaps the Operational Area and the EMBA. Fishery Status Report 2022 indicates current fishing effort is concentrated between Shark Bay and Cape Range, and occurred within the EMBA (ABARES, 2021). Fishery Status Reports indicate most recent activity within the Operational Area occurred in the 2016 - 2017 season (ABARES, 2021). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Western Tuna and Billfish Fishery	x	✓	The Western Tuna and Billfish Fishery management area overlaps the Operational Area and the EMBA. The Western Tuna and Billfish Fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. Fishery Status Report 2022 indicates current fishing effort is concentrated between Carnarvon and Albany, and occurred within the EMBA (ABARES, 2021). Fishing Status Reports indicated no fishing efforts occurred in the Operational Area in the last 5 years. Accordingly, Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Southern Bluefin Tuna Fishery	x	x	The Southern Bluefin Tuna Fishery management area overlaps the Operational Area and the EMBA. The Southern Bluefin Tuna Fishery spans the Australian Fishing Zone, however since 1992, the majority of Australian catch has concentrated in south-eastern Australia (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activities Program.
Western Skipjack Tuna Fishery	x	x	The Western Skipjack Tuna Fishery management area overlaps the Operational Area and the EMBA. The Western Skipjack Tuna Fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The Fishery is not currently active and no fishing has occurred since 2009 (ABARES, 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activities Program.
State Managed Fisheries			
Pilbara Line Fishery	✓	✓	The Pilbara Line Fishery licensees are permitted to operate anywhere within Pilbara waters (Newman et al., 2021), overlapping the EMBA. The fishery is active in the EMBA, with eleven 60 NM Catch and Effort System (CAES) blocks reporting up to five licences across the 2017 – 2022 seasons (DPIRD, 2022). The Operational Area overlaps 60 NM CAES blocks 19130, 19140, 19150, 20130, 20140 and 20160. FishCube data for the Pilbara Line Fishery is not provided at the 10 NM scale, therefore it is uncertain if the effort reported in the 60 NM CAES blocks 20160 and 19150 overlaps with the Operational Area, however given the extent of the Operational Area, Woodside considers it a possibility that interactions with the fishery may occur.
Pilbara Fish Trawl (Interim) Managed Fishery	✓	✓	The Pilbara Fish Trawl (Interim) Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery has remained consistently active in the EMBA over the last 5 years, with six 60 NM CAES blocks reporting up to four vessels across each season between 2017 – 2022 (DPIRD, 2022). The fishery is active across the Operational Area with one 10 NM CAES blocks reporting up to four vessels active between the 2017 – 2022 seasons (DPIRD, 2022). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and the EMBA.
Specimen Shell Managed Fishery	✓	✓	The Specimen Shell Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery is active across the EMBA with ten 60 NM CAES blocks reporting up to six licences active between the 2017 – 2022 seasons (DPIRD, 2022). The fishery is active across the Operational Area with one 10 NM CAES blocks reporting less than three vessels active between the 2017 – 2019 seasons (DPIRD, 2022). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and the EMBA.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Marine Aquarium Fish Managed Fishery	✓	✓	The Marine Aquarium Fish Managed Fishery management area overlaps the Operational Area and EMBA. The fishery is active across the EMBA with eight 60 NM CAES blocks reporting up to six licences active between the 2017 – 2022 seasons (DPIRD, 2022). The fishery is active across the Operational Area with two 10 NM CAES blocks reporting up to four vessels active between the 2017 – 2022 seasons (DPIRD, 2022). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and the EMBA.
Pilbara Crab Managed Fishery	✓	✓	The Pilbara Crab Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery has remained consistently active in the EMBA over the last 5 years with two 60 NM CAES blocks reporting less than three licences across 2017 – 2022 seasons (DPIRD, 2022). FishCube data for the Pilbara Crab Fishery is not provided at the 10 NM scale, therefore it is uncertain if the effort reported in the 60 NM CAES blocks overlaps with the Operational Area. However, given the extent of the Operational Area, Woodside considers it a possibility that interactions with the fishery may occur.
Pilbara Trap Managed Fishery	✓	✓	The Pilbara Trap Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery is active across the EMBA with thirteen 60 NM CAES blocks reporting up to three vessels active between the 2017 – 2022 seasons (DPIRD, 2022). FishCube data for the Pilbara Trap Fishery is not provided at the 10 NM scale, therefore it is uncertain if the effort reported in the 60 NM CAES blocks overlaps with the Operational Area. However given the extent of the Operational Area, Woodside considers it a possibility that interactions with the fishery may occur.
Mackerel Managed Fishery (Area 2 and Area 3)	✓	✓	The Mackerel Managed Fishery management area overlaps the Operational Area and the EMBA. The fishery is active across the EMBA with fifteen 60 NM CAES blocks reporting up to six vessels active between the 2017 – 2022 seasons (DPIRD, 2022). The fishery is active across the Operational Area with ten 10 NM CAES blocks reporting up to three vessels active between the 2017 – 2022 seasons (DPIRD, 2022). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and the EMBA.
Western Australian Sea Cucumber Fishery	✓	✓	The Western Australian Sea Cucumber Fishery management area overlaps the Operational Area and the EMBA. The FishCube data reported three CAES blocks overlapping the EMBA (DPIRD, 2022). Fishing effort was reported by less than three vessels across the 2017 – 2022 seasons (DPIRD, 2022). The fishery is active across the Operational Area with one 10 NM CAES blocks reporting less than three vessels active between the 2018 – 2019 seasons (DPIRD, 2022). Accordingly, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and the EMBA.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Nickol Bay Prawn Managed Fishery	✓	✓	The Nickol Bay Prawn Managed Fishery management area overlaps the Operational Area and the EMBA. FishCube data reports fishing effort occurs within the EMBA across seven 60 NM CAES blocks, reporting up to 8 licences across the 2017 – 2022 seasons (DPIRD, 2022). FishCube data reported active fishing by less than three vessels in 2017 – 2018 season in the 10 NM CAES block 202164 that overlaps the Operational Area. Accordingly, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and the EMBA.
West Coast Deep Sea Crustacean Managed Fishery	x	✓	The West Coast Deep Sea Crustacean Managed Fishery is permitted to fish in waters deeper than the 150 m isobath overlapping the Operational Area and EMBA. The fishery has remained consistently active in the EMBA between the 2017 – 2022 seasons with ten 60NM CAES blocks overlapping the EMBA reported less than 3 vessels with active fishing effort (DPIRD, 2022). The FishCube data reported no active fisheries at 10 NM overlapping the Operational Area (DPIRD, 2022). Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Onslow Prawn Managed Fishery	x	✓	The Onslow Prawn Managed Fishery management area overlaps the Operational Area and the EMBA. FishCube data reports fishing effort occurs within the EMBA across five CAES blocks reporting less than three licenses across 2018 – 2022 seasons (DPIRD, 2022). The FishCube data reported no active fisheries at 10 NM overlapping the Operational Area (DPIRD, 2022). Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Exmouth Gulf Prawn Managed Fishery	x	✓	The Exmouth Gulf Prawn Managed Fishery management area overlaps the EMBA. The fishery has remained consistently active in the EMBA between the 2017 – 2022 seasons with two 60NM CAES block overlapping the EMBA reporting up to six vessels with active fishing effort (DPIRD, 2022). Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Shark Bay Scallop Managed Fishery	x	✓	The Shark Bay Scallop Managed Fishery management area overlaps the EMBA (DPIRD 2022). FishCube data reports fishing effort occurs within the EMBA across one CAES blocks reporting up to fourteen licenses across 2017 – 2018 season (DPIRD, 2022). FishCube data reported no active fisheries at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2022). Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Shark Bay Crab Managed Fishery	x	✓	The Shark Bay Crab Managed Fishery management area overlaps the EMBA (DPIRD 2022). FishCube data reports fishing effort occurs within the EMBA across one CAES blocks reporting up to twenty licenses across 2017 – 2022 seasons (DPIRD, 2022). FishCube data reported no active fisheries at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2022). Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Shark Bay Prawn Managed Fishery	x	✓	The Shark Bay Prawn Managed Fishery management area overlaps the EMBA (DPIRD 2022). FishCube data reports fishing effort occurs within the EMBA across one CAES blocks reporting up to eighteen licenses across 2017 – 2022 seasons (DPIRD, 2022). FishCube data reported no active fisheries at 10 NM CAES blocks overlapping the Operational Area

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
			(DPIRD, 2022). Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Open Access in the North Coast, Gascoyne Coast and West Coast Bioregions	x	✓	There is no publicly available information on the extent of the management area for the Open Access Fishery, however FishCube data reports fishing effort occurs within the EMBA across one CAES blocks reporting less than three licenses across 2017 – 2019 seasons (DPIRD, 2022). FishCube data reported no active fisheries at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2022). Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
West Coast Rock Lobster Fishery	x	✓	The Western Rock Lobster Fishery management area overlaps the EMBA (DPIRD 2022). FishCube data reports fishing effort occurs within the EMBA across two CAES blocks reporting up to three licenses across 2017 – 2020 seasons (DPIRD, 2022). FishCube data reported no active fisheries at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2022). Woodside considers there to be potential for interaction with this fishery and the Petroleum Activities Program within the EMBA.
Gascoyne Demersal Scalefish Fishery	x	✓	The Gascoyne Demersal Scalefish Fishery management area overlaps the EMBA (DPIRD 2022). FishCube data reports fishing effort occurs within the EMBA across five CAES blocks reporting up to twelve licenses across 2017 – 2022 seasons (DPIRD, 2022). FishCube data reported no active fisheries at 10 NM CAES blocks overlapping the Operational Area (DPIRD, 2022). Woodside considers it a possibility that interactions with the fishery may occur in the EMBA.
Abalone Managed Fishery	x	x	The Abalone Managed Fishery management area overlaps the Operational Area and the EMBA. FishCube reported no fishing effort within the EMBA and Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activities Program.
Land Hermit Crab Managed Fishery	x	x	The Land Hermit Crab Managed Fishery management area overlaps the EMBA where shoreline contact is predicted. FishCube reported no fishing effort within the EMBA where shoreline contact has been modelled. Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activities Program.
West Coast Demersal Gillnet Managed Fishery	x	x	The West Coast Demersal Gillnet Managed Fishery management area overlaps the EMBA. FishCube reported no fishing effort within the EMBA and Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activities Program.
South West Coast Salmon Managed Fishery	x	x	The South West Coast Salmon Fishery management area overlaps the Operational Area and EMBA. FishCube data reported no fishing effort occurs north of the Perth metropolitan area (DPIRD, 2022). Accordingly, no fishing effort occurs within the EMBA and Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activities Program.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fishery	Potential for interaction		
	Operational Area	EMBA	Description
Pearl Oyster Managed Fishery	x	x	The Pearl Oyster Managed Fishery management area overlaps the EMBA. However, FishCube data reported no fishing effort within the Operational Area or EMBA in the last five years (2017 – 2022) (DPIRD, 2022). Accordingly, Woodside considers there to be no potential for interaction with this fishery and the Petroleum Activities Program.
Charter based commercial operators			
Tour Operators	✓	✓	<p>Fishing Tour Operators are permitted to operate across WA state waters and are required to report monthly logbook records of client fish catches. FishCube data reports consistent fishing effort across fourteen 60 NM CAES blocks that overlap the EMBA (DPIRD 2022). Fishing effort was reported by up to twenty vessels across the 2017 – 2022 seasons (DPIRD, 2022).</p> <p>FishCube data reports consistent fishing effort across seventeen 60 NM CAES blocks that overlap the Operational Area (DPIRD 2022). Fishing effort was reported by up to four vessels across the 2017 – 2022 seasons (DPIRD, 2022).</p> <p>FishCube data indicate tour operator fishing effort highest around Ningaloo and Muiron Islands, Shark Bay and at Barrow Island and the Montebello Islands. Accordingly, Woodside considers it a possibility that interactions with the fishery may occur within the Operational Area and the EMBA.</p>

4.9.3 Traditional Fisheries

Due to the depth of the majority of the Operational Area, there is unlikely to be any traditional fisheries, with exception of shallower depths in the Trunkline Project Area near the State waters boundary. The coastal waters of the Dampier Archipelago, as well as the Montebello Islands, Ningaloo Reef and Barrow Island within the EMBA have a known history of traditional fishing.

4.9.4 Tourism and Recreation

Tourism activities may occur in the Operational Area close to the Dampier Archipelago. However, the Operational Area is located far from most tourism activities in the NWMR. Recreational fishing may occur throughout the EMBA, primarily in continental shelf waters, around offshore islands and near shoreline areas. Dolphin and turtle watching tours may occur near the Dampier Archipelago within the EMBA. Cruise ships operate within the EMBA. Dive sites are located in a number of locations within the EMBA including Montebello Islands, and Rowley Shoals.

4.9.5 Commercial Shipping

The Australian Maritime Safety Authority (AMSA) has introduced a network of marine fairways across the NWMR off WA to reduce the risk of vessel collisions with offshore infrastructure. It is noted that a number of these fairways intersect with the Operational Area; the nearest shipping fairway is approximately 1 km to the north-west of the Operational Area (Figure 4-23).

Commercial shipping traffic is high within the NWMR, with vessel activities including commercial fisheries, tourism such as cruises, international shipping and oil and gas operations. There are 12 ports adjacent to the NWMR, including the major ports of Dampier, Port Hedland and Broome, which are operated by their respective port authorities. The State waters adjacent to the easternmost point of the Trunkline Project Area falls within the boundaries of the Pilbara Ports Authority, within which the ports of Dampier and Port Hedland lie. Vessel tracking data suggest shipping is concentrated to the east of the Operational Area where increased vessel traffic will be associated with ports servicing the resource industry at Barrow Island, Onslow and Dampier (Section 11.8, Appendix H).

The Port of Dampier overlaps the EMBA (Figure 4-23) through the Dampier Archipelago and is a major industrial port in the north-west of WA. It is currently one of the world's largest bulk export port by tonnage and services the petrochemical, salt, iron ore and natural gas export industries. It is also the departure point for day cruises through the Dampier Archipelago.

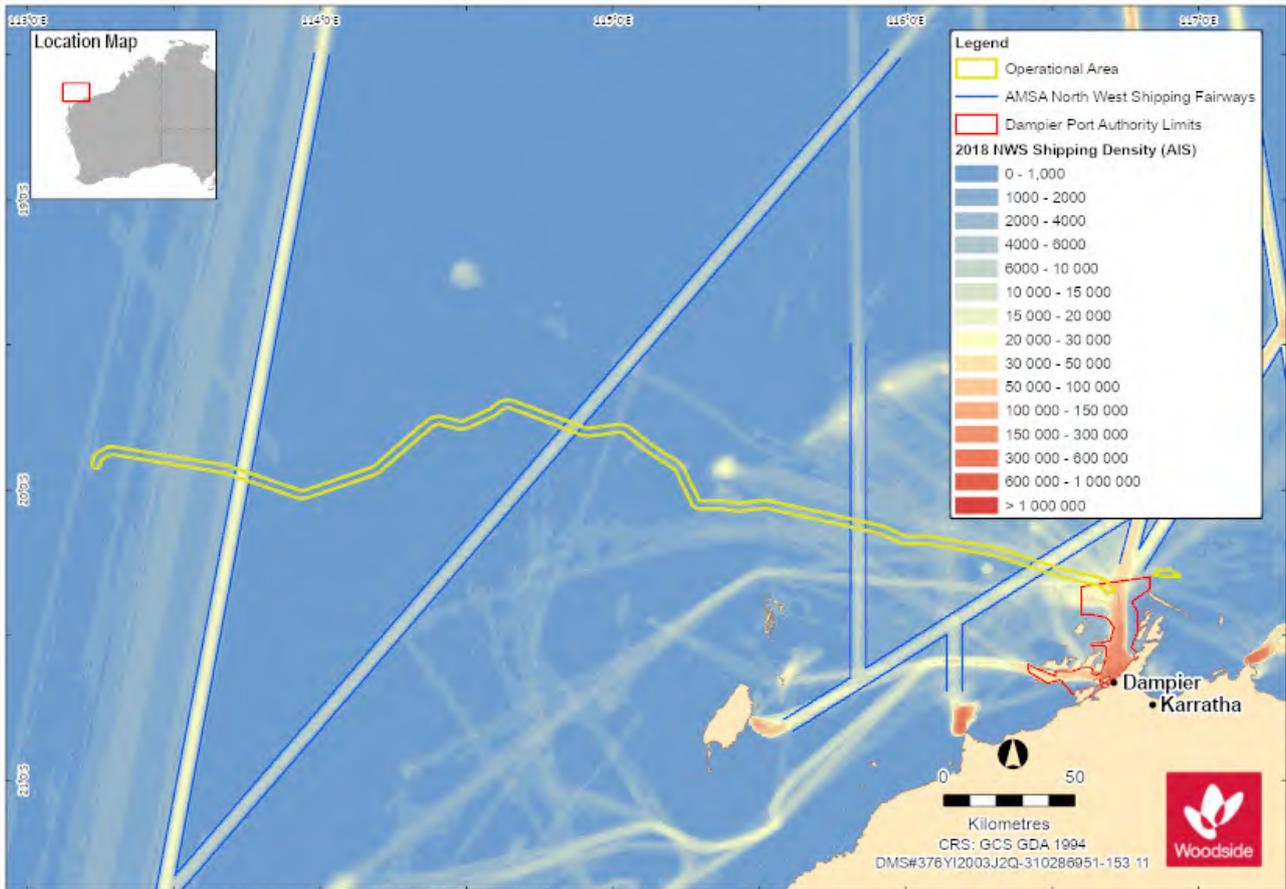

Figure 4-23: Vessel density map for the Operational Area and EMBA, derived from AMSA satellite tracking system data (vessels include cargo, LNG tanker, passenger vessels, support vessels, and others/unnamed vessels)

4.9.6 Oil and Gas

The Operations Area is located within the Exmouth Plateau area of the Northern Carnarvon Basin. There are a number of petroleum titles held by various title holders within the EMBA. The Trunkline Project Area intersects several existing oil and gas pipelines (Table 3-8) and several facilities are located within 50 km of the Operational Area (Table 4-29; Figure 4-24).

Table 4-29: Other oil and gas facilities located within 50 km of the Operational Area

Facility Name and Operator	Distance and direction from Operational Area to facility
Pluto Platform - Woodside	2 km north
Wheatstone Platform - Chevron	10 km north
Stag Platform - Jadestone	5 km south
Reindeer Platform - Santos	15 km north
Goodwyn Platform - Woodside	48 km north
Campbell Platform and Sinbad platform (Varanus hub) - Santos	50 km south

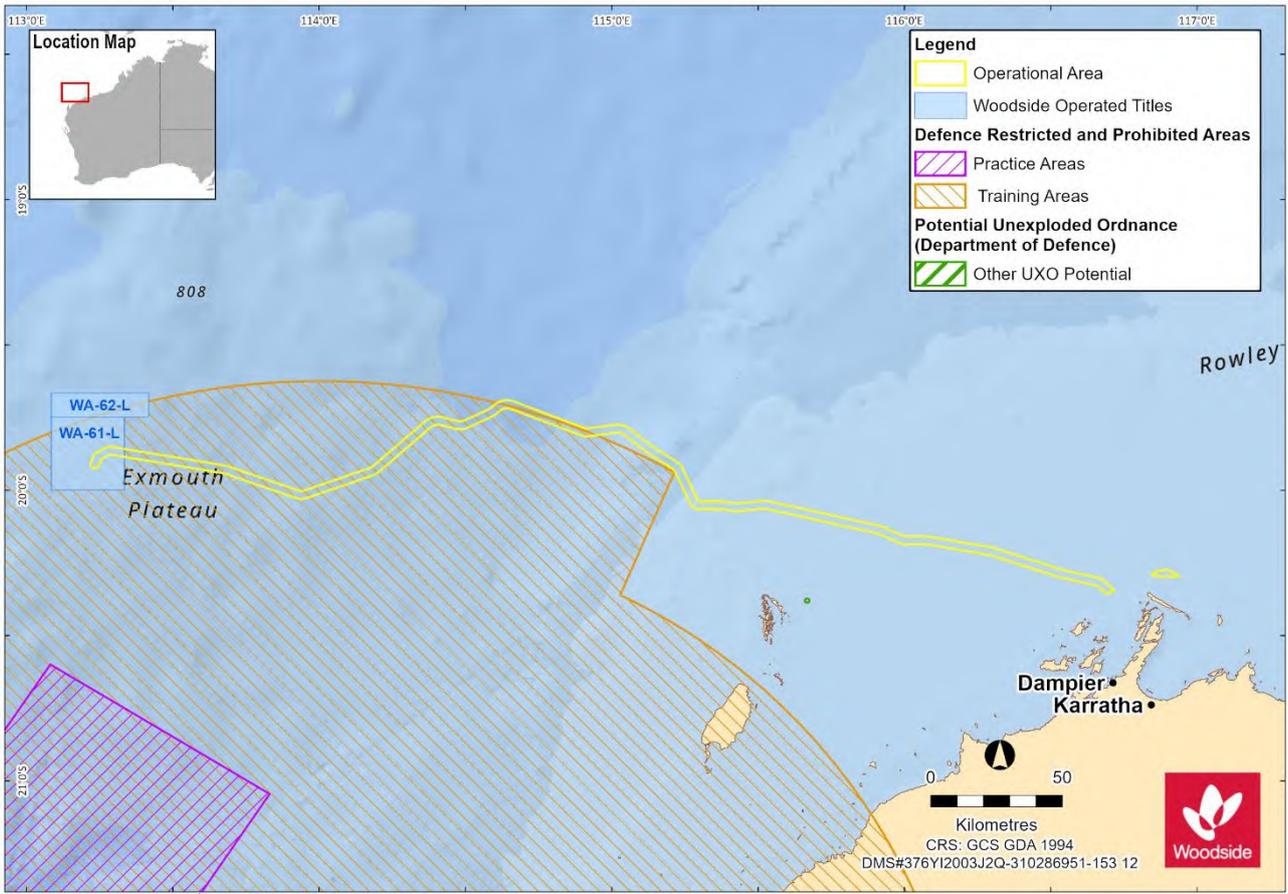

Figure 4-25: Defence areas within the Operational Area

5 CONSULTATION

5.1 Summary

Woodside consults relevant persons in the course of preparing an EP in accordance with regulation 11A of the Environment Regulations. Woodside acknowledges that consultation is designed to ensure that relevant persons are identified and given sufficient information and a reasonable period to allow them to make an informed assessment of the possible consequences of the proposed activity on them and, to ensure that titleholders can consider and adopt appropriate measures in response to the matters raised by relevant persons. Consistent with regulation 3 of the Environment Regulations, consultation also supports Woodside's objective to ensure that the environmental impacts and risks of the activity are reduced to ALARP and an acceptable level.

Woodside acknowledges that a titleholder's approach to consultation must be informed by both the Environment Regulations and the findings of the Full Federal Court in the *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193 (Tipakalippa Appeal) (see Section 5.5.2 and 5.5.1) delivered on 2 December 2022.

For this PAP, Woodside has considered both the Operational Area and the broader EMBA in undertaking consultation (see further discussion in Section 5.2). The broadest extent of the EMBA has been determined by reference to the highly unlikely event of a hydrocarbon release resulting from the Petroleum Activities Program (see Section 4).

Woodside's consultation methodology is divided into three parts:

- The first section (Section 5.2 to 5.7) provides an overview of Woodside's consultation methodology for its EPs, including how we apply regulation 11A(1) of the Environment Regulations to identify relevant persons.
- The second section (Section 5.8) explains Woodside's application of the consultation methodology and Woodside's assessment of relevant persons for this EP.
- The third section (Section 5.9) details the:
 - Opportunities provided to persons or organisations to be aware of Woodside's proposed EP and participate in consultation, including individual Traditional Custodians.
 - Consultation information provided to relevant persons, feedback received and Woodside's assessment of the merits of objections or claims.

Engagement with persons or organisations that Woodside chose to contact who are not relevant persons for the purposes of regulation 11A(1) of the Environment Regulations (see Section 5.4.3).

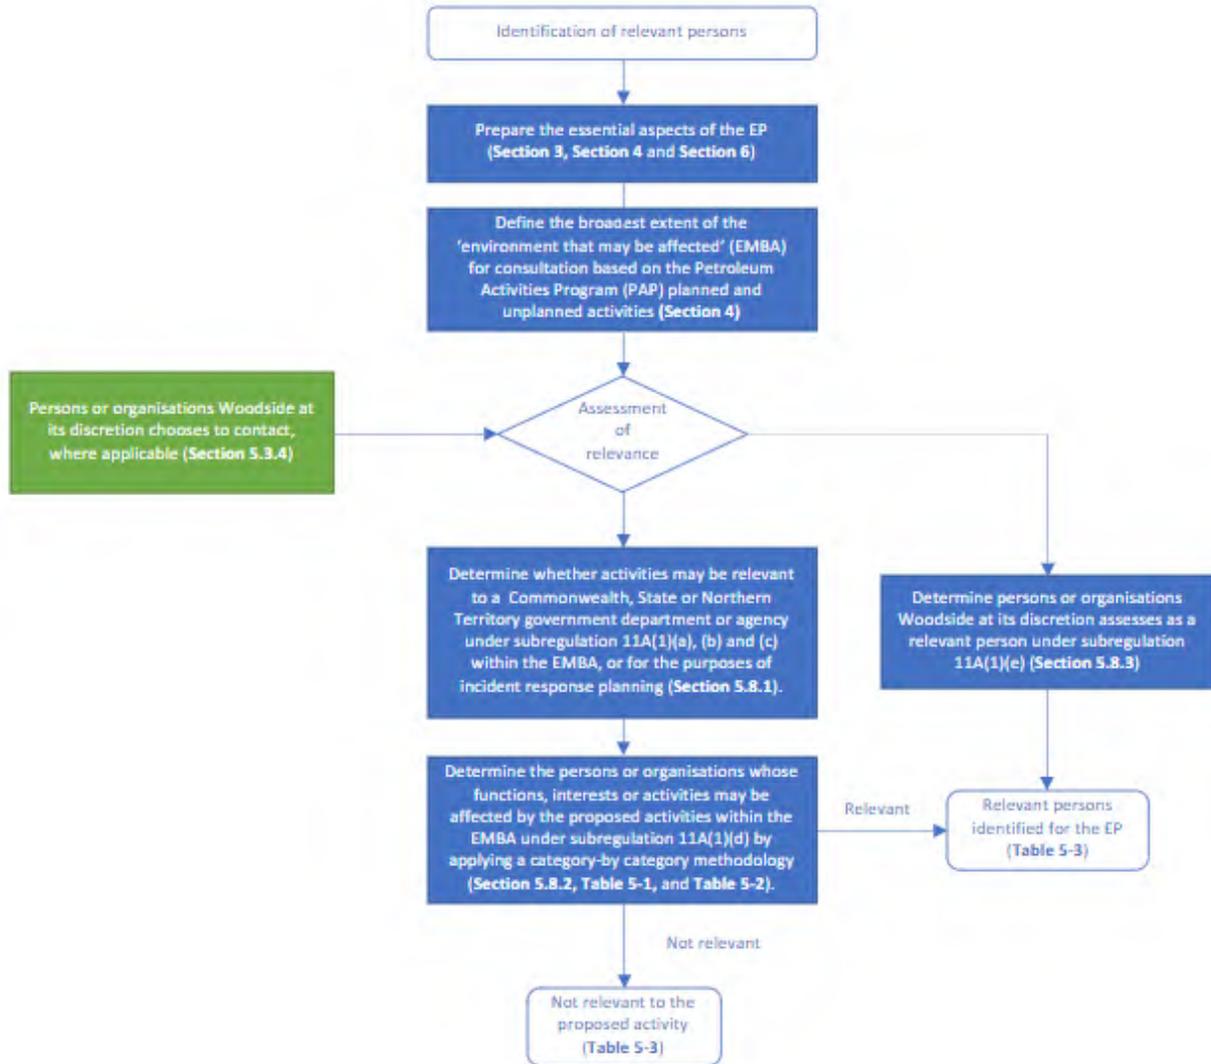

Figure 5-1: Overview of Woodside’s methodology to identify relevant persons

5.2 Consultation – General Context

Woodside has a portfolio of quality oil and gas assets and more than 30 years of operating experience. We have a strong history of working with local communities, the relevant regulators and a broad range of persons and organisations to understand the potential risks and impacts from our proposed activities and to develop appropriate measures to manage them.

The length of time that we have operated in Commonwealth and State waters, and the history of continued engagement with a wide range of persons and organisations enables Woodside to develop an extensive consultation list to inform its consultation process. This consultation list is not used as a definitive list of persons to consult, but rather, assists Woodside as an input to its understanding of relevant persons with whom to consult on a proposed petroleum activity. The information in the consultation list has been captured from years of experience, it contains insights relating to the type of information particular persons or organisations want to receive during consultation, the appropriate method of consultation for relevant persons and includes appropriate contact details, which are reviewed and updated periodically.

Woodside acknowledges NOPSEMA's Guideline on *Consultation in the course of preparing an environment plan* (12 May 2023) as well as recent judicial guidance in the Tipakalippa Appeal (in the Full Federal Court's decision in *Santos NA Barossa Pty Ltd v Tipakalippa* [2022] FCAFC 193) on the intent of consultation as follows:

- At paragraph 54 of the appeal decision: ... provide a basis for NOPSEMA's considerations of the measures, if any, that a titleholder proposes to take or has taken to lessen or avoid the deleterious effect of its proposed activity on the environment, as expansively defined.
- At paragraph 89 of the appeal decision: ...its purpose is to ensure that the titleholder has ascertained, understood and addressed all the environmental impacts and risks that might arise from its proposed activity. Consultation facilitates this outcome because it gives the titleholder an opportunity to receive information that it might not otherwise have received from others affected by its proposed activity. Consultation enables the titleholder to better understand how others with an objective stake in the environment in which it proposes to pursue the activity perceive those environmental impacts and risks. As the Regulations expressly contemplate, it enables the titleholder to refine or change the measures it proposes to address those impacts and risks by taking into account the information acquired through the consultations. Objectively, the scheme intends that this is likely to improve the minimisation of environmental impacts and risks from the activity.
- The Tipakalippa Appeal has also been further considered in the context of specific methods for consultation with First Nations relevant persons (Section 5.5.1).

In order to undertake consultation, Woodside has developed a methodology for identifying relevant persons, in accordance with regulation 11A(1) of the Environment Regulations (Section 5.3). This methodology reflects NOPSEMA's recent guideline and demonstrates that, in order to meet the requirements of regulation 10A (criteria for EP acceptance) when preparing the EP, Woodside understands:

- our planned activities in the Operational Area, being the area in which our planned activities are proposed to occur (see Section 3.5) and
- the geographical extent to which the environment may be affected (EMBA) by risks and impacts from our activities (unplanned) (identified in Section 4.1 and assessed in Section 6.8).

Woodside has undertaken consultation in the course of preparing this EP in compliance with regulation 11A of the Environment Regulations, which requires a titleholder to:

- consult with each of the following (a relevant person) in the course of preparing an environment plan:
 - each Department or agency of the Commonwealth to which the activities to be carried out under the environment plan, or the revision of the environment plan, may be relevant;
 - each Department or agency of a State or the Northern Territory to which the activities to be carried out under the EP, or the revision of the EP, may be relevant;
 - the Department of the responsible State Minister, or the responsible Northern Territory Minister;
 - a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP, or the revision of the EP; and
 - any other person or organisation that the titleholder considers relevant (regulation 11A(1)).
- give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on their functions, interests or activities (regulation 11A(1)(2));
- allow a relevant person a reasonable period for the consultation (regulation 11A(1)(3)); and

- tell each relevant person that the titleholder consults with, that the relevant person may request that particular information it provides in the consultation not be published and any information subject to such a request is not to be published (regulation 11A(1)(4)).

Further, Woodside seeks to carry out consultation in a manner that:

- is consistent with the principles of ecologically sustainable development (ESD) set out in section 3A of the EPBC Act – see Section 2;
- is intended to reduce the environmental impacts and risks from the activity to ALARP and an acceptable level;
- seeks to ensure that the environmental impacts and risks of the activity will be of an acceptable level;
- is intended to minimise harm to the relevant person and the environment from the proposed petroleum activities and to enable Woodside to consider measures that may be taken to mitigate the potential adverse environmental impacts that the petroleum activity may otherwise cause;
- is collaborative; Woodside respects that for a relevant person, consultation is voluntary. Where the relevant person seeks to engage, Woodside collaborates with the relevant person with the aim of seeking genuine and meaningful two-way dialogue; and
- provides opportunities for relevant persons to provide feedback throughout the life of the EP through its ongoing consultation process (refer to Section 5.7 and Section 7.17.2.1)

An overview of Woodside's consultation approach is outlined below at Figure 5-2 below:

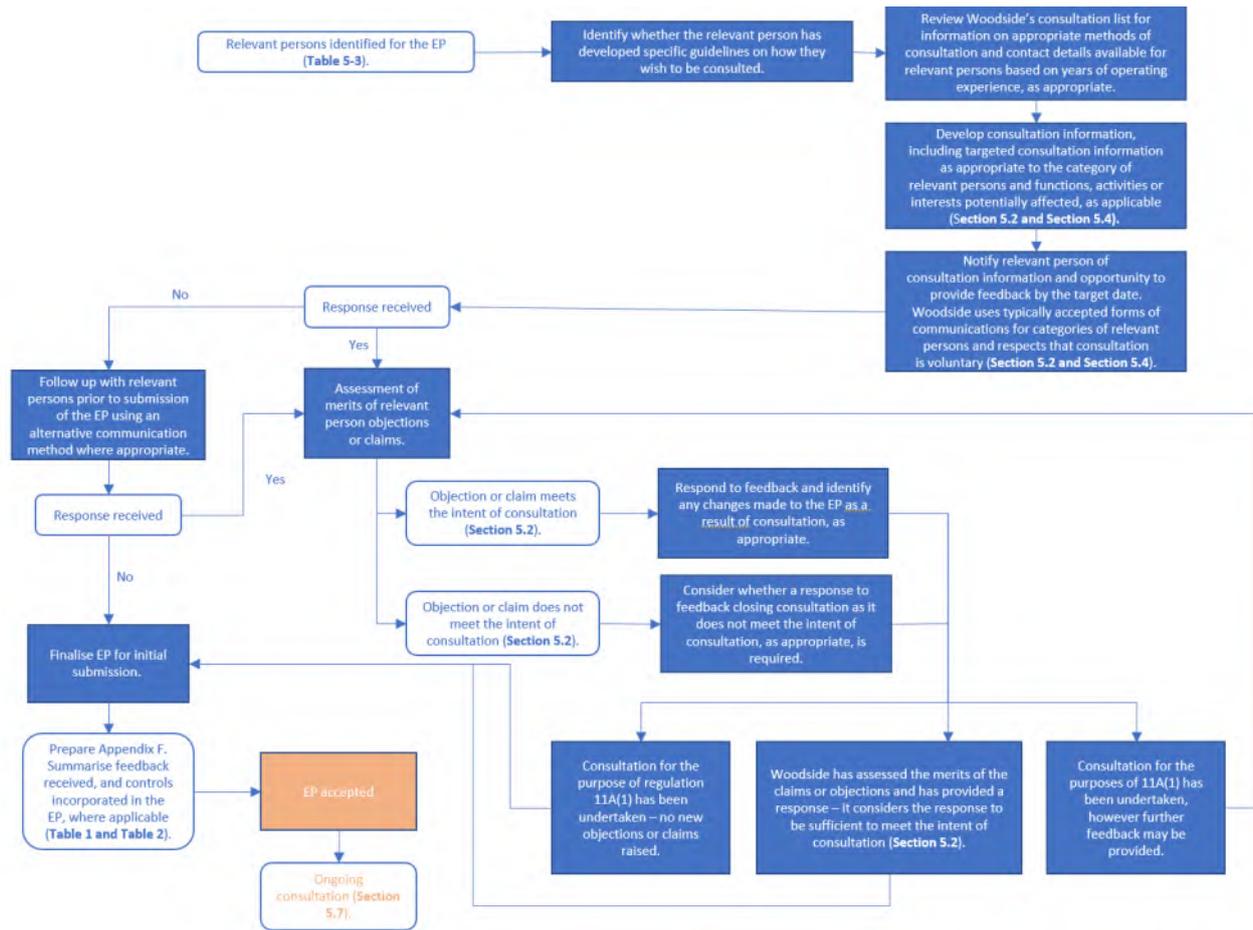

Figure 5-2: Overview of Woodside’s consultation approach

The methodology for consultation for this activity has been informed by various guidelines and relevant information for consultation on planned activities, including:

5.3 Identification of Relevant Persons for Consultation

5.3.1 Regulations 11A(1)(a), (b) and (c)

The relevant inquiry for determining relevant persons within the description of regulations 11A(1)(a) and (b) is whether the activities to be carried out under the EP may be relevant to one of the government departments or agencies in those regulations. These government departments and agencies are listed in Table 5-3: Assessment of relevance below. In accordance with regulation 11A(1)(c), Woodside consults with the department of the relevant State Minister, which for this EP is the Department of Mines, Industry Regulation and Safety (DMIRS).

5.3.2 Regulation 11A(1)(d)

In order to identify a relevant person for the purposes of regulation 11A(1)(d), the meaning of “functions, interests or activities” needs to be understood. In regulation 11A(1)(d), the phrase “functions, interests or activities” should be construed broadly and consistently with the objects of the Environment Regulations (regulation 3) and the objects of the EPBC Act (section 3A).

In developing its methodology for consultation, Woodside acknowledges that the guidance on the definition of functions, interests and activities is as follows in accordance with NOPSEMA’s *GL2086 – Consultation in the course of preparing an environment plan* guideline (May 2023):

Functions	Refers to a power or duty to do something.
Interests	Conforms to the accepted concept of ‘interest’ in other areas of public administrative law and includes any interest possessed by an individual whether or not the interest amounts to a legal right or is a proprietary or financial interest or relates to reputation.
Activities	Broader than the definition of ‘activity’ in Regulation 4 of the Environment Regulations and is likely be directed to what the relevant person is already doing.

As discussed in Section 5 and Section 5.2, Woodside's methodology for determining 'relevant persons' for the purpose of regulation 11A(1)(d) of the Environment Regulations includes consideration of:

- whether a person or organisation has functions interests or activities that overlap with the Operational Area and EMBA; and
- whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities.

5.3.3 Regulation 11A(1)(e)

In addition to assessing relevance under regulation 11A(1)(d), Woodside has discretion to categorise any other person or organisation as a relevant person under regulation 11A(1)(e).

5.3.4 Persons or Organisations Woodside Chooses to Contact

In addition to undertaking consultation with relevant persons under regulation 11A(1) there are persons or organisations that Woodside chooses to contact, from time to time, in relation to a proposed activity. For example, these are persons or organisations:

- that are 'not relevant' pursuant to regulation 11A(1) but that Woodside has chosen to seek additional guidance from, for example, to inform the correct contact person that Woodside should consult, or engage with;
- that are 'not relevant' pursuant to regulation 11A(1) but have been contacted as a result of consultation requirements changing or updated guidance from the Regulator; and
- where it is unclear what their functions, interests or activities are, or whether their functions, interests or activities may be affected. In this circumstance, engagement is required to inform relevance under Woodside's methodology. Woodside follows the same methodology for assessing a person or organisations relevance as it does during its initial assessment (as described in Figure 5-1 and Section 5.8). The result of Woodside's assessment of relevance during the development of the EP is outlined at Table 5-3.

Engagement undertaken with persons or organisations Woodside assessed as not relevant but chose to contact are summarised at Appendix F, Table 2.

5.4 Consultation Material and Timing

Regulation 11A(2) provides that a titleholder must give each relevant person sufficient information to allow the relevant person to make an informed assessment of the possible consequences of the activity on the functions, interests or activities of the relevant person. Regulation 11A(3) provides that the titleholder must allow a relevant person a reasonable period for the consultation.

As set out in Section 5.2, Woodside notifies relevant persons, of the proposed activities, respecting that consultation is voluntary (for the relevant person) and collaborates on a consultation approach where further engagement is sought by the relevant person. Woodside understands that the consultation process should be appropriate for the category of relevant persons and that not all persons or organisations will require the same level of engagement. Woodside recognises that the level of engagement is dependent on the nature and scale of the Petroleum Activities Program. Woodside recognises published guidance for good practice consultation relevant to different sectors and disciplines (see Section 5.2). Woodside's methodology for providing relevant persons with sufficient information as well as a reasonable period of time to provide feedback is set out in this section.

5.4.1 Sufficient Information

Woodside produces a Consultation Information Sheet for each EP (Appendix F, reference 1.1 and 2.1). This is provided to relevant persons and organisations and is also available on Woodside's website for interested parties to access and to provide feedback on. The Consultation Information Sheet typically includes a description of the proposed petroleum activity, the Operational Area where the activity will take place, the timing and duration of the activity, a location map of the Operational Area and EMBA, a description of the EMBA, relevant exclusion zones as well as a summary of relevant risks and mitigation and/or management control measures relevant to the proposed petroleum activity. It also sets out contact details to provide feedback to Woodside.

Woodside recognises that the level of information necessary to assist a person or organisation to understand the impacts of the proposed activity on their functions, interests or activities may vary and, also may depend on the degree to which a relevant person is affected. For example, Woodside considers that relevant persons who may be impacted by planned activities in the Operational Area, for example as a result of temporary displacement due to exclusion zones, may require more targeted information relevant to their functions, interests or activities. Woodside also acknowledges NOPSEMA's brochure entitled *Consultation on offshore petroleum environment plans information for the community*, which advises consultees that they may inform titleholders that they only want to be consulted in the very unlikely event of an oil spill.

Woodside places advertisements in a selected local, state and national newspaper. This typically includes the name of the EP Woodside is seeking feedback on, an overview of the activity, the consultation feedback date and the ways in which a person or organisation can provide feedback. Advertising in the local paper in the area of the activity is also consistent with the public notification process under section 66 of the *Native Title Act* for native title applications. Woodside typically aligns advertisement feedback timeframes with the timing described below. Feedback received is assessed in accordance with Section 5.8 to determine relevance and evidenced in Appendix F, Table 1 as appropriate.

Woodside utilises a range of tools to provide sufficient information to relevant persons, which may include one or more of the following:

- Consultation Information Sheet available on Woodside's website;
- Summary Consultation Information Sheet, presentations or summaries specific to a particular relevant person group;
- subscription available on Woodside's website to receive notification of new Consultation Information Sheets for Woodside EPs;
- emails;
- letters;
- phone calls;
- face-to-face meetings (virtual or in person) with presentation slides or handouts as appropriate;
- Maps outlining a persons or organisations defined area of responsibility in relation to the proposed activity, for example a fisheries management area or defence training area; and
- community meetings, as appropriate.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that in line with the intent of consultation (see Section), the threshold for genuine two-way engagement is met via information on incorporation of controls, where applicable, being provided to the relevant person to ensure the relevant persons understand how their input has been considered in the development of the EP.

Woodside communicates with relevant persons in different ways. Woodside recognises that as part of genuine two-way dialogue, these forms of communication may evolve, including for example due to changes to organisation representation, as relationships are further established, or an alternative form of communication is expressed by a person or organisation. Woodside acknowledges that there might be limitations in how it can consult with relevant persons.

Typical forms of communications for categories of relevant persons are set out below.

Category of relevant person	Typically accepted form of communication
Government departments / agencies – marine	Woodside applies NOPSEMA’s guideline for engagement with Commonwealth government departments or agencies in line with <u>GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023</u> by using email for its consultation unless another form of communication is requested.
Government departments / agencies – environment	
Government departments / agencies – industry	
Commercial fisheries and peak representative bodies	<p>Commonwealth commercial fisheries: Email is used as the primary form of communication with Commonwealth commercial fisheries in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.</p> <p>State commercial fisheries and recreational marine users: The Western Australian Department of Primary Industries and Regional Development (DPIRD) has responsibility for managing the <i>Fish Resources Management Act 1994</i> and <i>Aquatic Resources Management Act 2016</i>, which limits the provision of contact details from the register to the name and business address of licence holders. Alternative forms of communication are at the licence holder’s discretion. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.</p> <p>Peak representative bodies: Email is used as the primary form of communication with commercial fishery and recreational marine user peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.</p>
Recreational marine users and peak representative bodies	
Titleholders and Operators	Email is used as the primary form of communication between titleholders and operators in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.
Peak industry representative bodies	Email is used as the primary form of communication with peak representative bodies in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.
Traditional Custodians and nominated representative corporations	The forms of communication that Woodside engages in are often bespoke and applied on a case-by-case basis and as appropriate to, or as requested by the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used where requested.
Native Title Representative Bodies	The forms of communication that Woodside engages in are often bespoke and applied on a case-by-case basis and as appropriate to the specific group, such as email, phone calls, meetings and community forums. Other forms of communication are used where requested.
Historical heritage groups or organisations	NOPSEMA’s guideline (<u>GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023</u>) for engagement with government departments or agencies is used as a reference for Woodside’s approach for communicating with historical heritage groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.
Local government and recognised local community	Local government: NOPSEMA’s guideline (<u>GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area – January 2023</u>)

<p>reference/liaison groups or organisations</p>	<p>for engagement with local government is used as a reference for Woodside’s approach for communicating with historical heritage groups or organisations. Community reference/liaison groups and chambers of commerce: Email is used as the primary form of communication with local community reference/liaison groups or organisations in the ordinary course of business. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.</p>
<p>Other non-government groups or organisations</p>	<p>Email is used as the primary form of communication with Other non-government groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.</p>
<p>Research Institutes and Local conservation groups or organisations</p>	<p>Email is used as the primary form of communication with research institutes and local conservation groups or organisations. Other forms of communication, such as phone calls, and meetings and/or presentation briefings are used where requested.</p>

Information which is provided to relevant persons for the purposes of consultation on this EP is summarised at Appendix F, Table 1.

Appendix F, Table 2 sets out the information which is provided to persons or organisations that are not relevant for the purposes of regulation 11A but which Woodside has chosen to contact (see Section 5.3.4).

When engaging in consultation, Woodside notifies relevant persons that, in accordance with regulation 11A(4), the relevant person may request that particular information the person or organisation provides in the consultation not be published and that information subject to that request will not be published.

5.4.2 Reasonable Period for Consultation

Woodside seeks to consult in order to support preparation of its Environment Plan. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity.

Woodside recognises that information may need to be provided to relevant persons in an iterative manner during the consultation process. Woodside considers that in line with the intent of consultation (see Section 5.2), the threshold for genuine two-way engagement is met via engagement on incorporation of controls, where applicable, being provided to the relevant person so that the relevant person understands how their input has been considered in the development of the Environment Plan.

Woodside has allowed a reasonable period for relevant persons, including Traditional Custodian relevant persons, to participate in consultation for this Environment Plan. The consultation period for this Environment Plan spans almost 2 years, from initial commencement of Woodside’s consultation period in August 2021, to submission of this Environment Plan, in October 2023.

The consultation period under this Environment Plan greatly exceeds benchmark periods under other relevant legislative processes:

- Consultation under Regulation 11B of the Regulations sets out a public consultation period of 30 days.
- The Department of Mines and Petroleum “Guidelines for Consultation with Indigenous People by Mineral Explorers” directs a period of 21- 30 days of consultation with traditional owners.
- Guidance taken from the previous *Aboriginal Cultural Heritage Act 2021—Consultation Guidelines* (Government of Western Australia, 2023) suggests that up to 12 weeks may be a reasonable period of time to allow identification, contact, and response, from First Nations peoples (subject to any alternative timeframe being agreed through co-design of consultation).

This extended period of consultation demonstrates that Woodside has provided a “reasonable period” for consultation in accordance with regulation 11A(3). Commentary in the Tipakalippa Appeal judgment limits consultation to a process that must be capable of being discharged within a reasonable time:

“it must be taken to be the regulatory intention that the consultation requirement cannot be one that is incapable of being complied with within a reasonable time...”

Woodside seeks feedback in order to support preparation of its Environment Plan. What constitutes a reasonable period for consultation is considered on a case-by-case basis, with reference to the person being consulted and the nature, scale and complexity of the activity.

Woodside's typical approach is as follows:

- advertising in a selected local, state and national newspapers to give persons or organisations the opportunity to understand the activity and identify whether their functions, interests or activities may be affected;
- providing consultation materials directly to identified relevant persons as well as persons who are not relevant but Woodside chose to contact (see Section 5.3.4), and providing a target date for feedback. Woodside acknowledges that feedback may be received from relevant persons following the target date;
- acknowledging that the way in which Woodside provides consultation information may vary depending on the relevant person or organisation and, may depend on the degree to which a relevant person or organisation is affected. Different consultation processes may be required for relevant persons and organisations depending on the information requirements;
- following up with relevant persons prior to EP submission. Where possible, Woodside will endeavour to use an alternative method of communication to contact the relevant person; and
- engaging in two-way dialogue with relevant persons or organisations where feedback is received.

Appendix F, Table 1 and Table 2 sets out a history of consultation and demonstrates that a reasonable period of consultation has been afforded for each relevant person.

Woodside considers that the “reasonable period” of consultation for this Environment Plan has been provided and the consultation under regulation 11A is complete.

As detailed in Section 5.7 and Section 7.15, if comments and feedback are received after the Environment Plan has been submitted, Woodside will consider those comments and update controls as appropriate, at all stages during the life of the Environment Plan, as per Woodside's ongoing consultation approach.

5.4.3 Discharge of Regulation 11A

The Full Federal Court made clear in the Tipakalippa Appeal that consultation should be approached in a “reasonable”, “pragmatic” and “not so literal” way, so that consultation obligations were capable of being met by titleholders (Section 5.5.1). Consultation is a “real world activity” and must be capable of reasonable discharge. The Full Federal Court referred to Native Title cases as an illustration that reasonable limits should be applied to consultation efforts to ensure the process is workable.

When the titleholder demonstrates that it has provided sufficient information and a reasonable period for consultation, the regulation 11A consultation requirements are met. Meeting these requirements is the evaluative judgment to determine reasonable satisfaction of the consultation obligation, and as such, the regulator uses its discretion to determine if these criteria are met. The nature of the person being consulted, and their function, interest and activity that may be affected, will inform the manner of consultation and the reasonable period to be afforded.

The titleholder is not required to obtain consent from a consultee to engage in the activity or confirmation from a consultee that consultation is complete. A titleholder is required to provide an opportunity to consult.

The Federal Court has commented that a “reasonable opportunity” for consultation must be afforded to relevant persons. A reasonable opportunity may not be every opportunity requested and is limited to reasonable opportunities to consult.

Woodside has completed all practicable and reasonable steps to discharge its consultation obligations. Woodside has provided sufficient information and a reasonable period of time to enable relevant persons to make an informed assessment of the possible impacts and risks of the activity on their functions, interests or activities, and sufficient time to provide relevant feedback for Woodside to assess relevant persons' claims and action the assessment and response. Woodside has also provided a reasonable opportunity for relevant persons to engage in genuine two-way dialogue on environmental impacts and concerns.

Woodside has discharged its duty under regulation 11A. Woodside considers that consultation under regulation 11A is complete.

Appendix F, Table 1 and Table 2 of this Environment Plan sets out the history of consultation under regulation 11A. To the extent a relevant person says that it has further information to share or claims that consultation under regulation 11A has not completed Appendix F, Table 1 and Table 2 provide reasons specifically why Woodside considers consultation under regulation 11A has been met in relation to that relevant person.

5.5 Context of Consultation Approach with First Nations

To comply with regulation 11A, Woodside identifies and consults Traditional Custodians whose functions, interests or activities may be affected by the activities under an Environment Plan.

5.5.1 Approach to Methodology – Woodside’s Interpretation of Tipakalippa

Woodside has implemented a consultation methodology consistent with regulation 11A and guidance provided in the Tipakalippa Appeal (Section 5.2). Woodside’s consultation methodology allows for a sufficiently broad capture of Traditional Custodian relevant persons, provides for informed consultation, follows cultural protocols and allows a reasonable opportunity for consultation with Traditional Custodians whose functions, interests and activities may be affected by the activity described in this Environment Plan (Section 5.5.2.1 to 5.5.2.3.)

Woodside notes the Full Federal Court discussed several Native Title Act 1993 (Cth) (NTA) cases in response to a submission made in that case that a requirement under regulation 11A to consult “each and every” relevant person would be “unworkable”. The reference to native title cases dealt with how decision-making processes under the NTA requiring “all” members of a group to be contacted for communal approval are interpreted by courts in a “reasonable”, “pragmatic” and “not so literal” way, and how obligations to consult “each and every” person under regulation 11A should be interpreted in a similarly pragmatic way so that consultation is workable. The reference to NTA authorities was made by analogy:

"It can be seen that the terms of [the native title legislation] are somewhat absolute – “all”. However, [the native title legislation] has consistently been construed in a way that is not so literal ... The cases concerning [the native title legislation] ... have reiterated ... that [the native title legislation] does not require that “all” of the members of the relevant claim group be involved in the decision. The key question will be whether a reasonable opportunity to participate in the decision-making process has been afforded by the notice for a relevant meeting."

“We consider the authorities in relation to processes under the NTA to be illustrative of how a seemingly rigid statutory obligation to consult persons holding a communal interest may operate in a workable manner” (emphasis added).

“there is no definition of what constitutes “consultation for the purpose of ref 11A... A titleholder will need to “demonstrate” to NOPSEMA that what it did constituted consultation appropriate and adapted to the nature of the interests of the relevant persons” (emphasis added).

It is clear from the Court's statement in relation to consultation with organisations that a Titleholder will have some decisional choice in identifying which natural person(s) are to be approached, how the information will be given to allow the "relevant person" to assess the possible consequence of the proposed activities on their functions, interests or activities, and how the requisite consultation is undertaken. Woodside takes this to mean that consultation is not fixed to a rigid process, and indeed, will need to be adapted so that it is informed by the relevant person or group. Woodside has met its regulation 11A requirements through its consultation methodology (Section 5.5.2).

Consistent with the Tipakalippa Appeal, Woodside considers NTA-style “full group” meetings are not the only way for there to be compliance with regulation 11A in relation to Traditional Custodian relevant persons. Nominated representative corporations (such as the Prescribed Bodies Corporates (PBCs) established under the NTA) have a designated role of representing the views of their own member Traditional Custodians. They have established methods for engaging with their own members. Woodside will not undermine the purpose and authority of nominated representative corporations by requiring full group meetings where the nominated representative corporations have not requested engagement of members via full group meetings. We do not consider it appropriate for titleholders to direct or challenge the nominated representative corporations on how to engage with their members.

Woodside’s approach described below demonstrates that sufficient information and a reasonable opportunity is provided to individual Traditional Custodians to provide feedback on Woodside activities beyond the opportunity provided to nominated representative corporations.

5.5.2 Consultation Method

Woodside’s First Nations team has extensive expertise in engaging and working with First Nations organisations and individuals, including having worked within the Commonwealth native title and cultural heritage systems and state and territory cultural heritage and land rights systems, for several decades. The team understands the complexities of making information accessible to groups and individuals and engaging in accordance with First Nations groups’ established channels of communication and methods of consultation. The First Nations team exercises its professional judgement and is deeply respectful of long-standing relationships (where in place) when considering consultation with First Nations groups. The First Nations team’s approach is also informed by the established systems of recognition for First Nations groups and their nominated representative corporations within particular jurisdictions.

For example, the methodology for engaging with First Nations groups in the Northern Territory (not relevant for this EP) tends to centre around engagement through Aboriginal land councils (under the Aboriginal Land Rights (Northern Territory) Act 1976 (Cth)) as well as community meetings that target clan groups where they do not have PBCs or other nominated representative corporations to represent them. By contrast, recognition for First Nations groups and their nominated representative corporations in Western Australia falls under the Native Title Act 1993 (Cth) because the vast majority of the Western Australian coastline is settled under the native title regime. This means that the methodology and process for consultation in Western Australia places greater emphasis on, but is not limited to Native Title Representative Bodies and PBCs.

Native title determinations provide certainty about the appropriate Traditional Custodian groups that have the cultural authority to speak for country adjacent to the EMBA, and also help Woodside to

identify Traditional Custodian persons and groups asserting Traditional Custodianship. The Full Court in the Tipakalippa Appeal explicitly endorsed methods of consultation with groups of relevant persons that are appropriate and adapted to the characteristics of groups. Woodside's consultation methodology is adapted and appropriate to the recognised systems of communal interests in Western Australia.

In Western Australia (relevant for this EP), Woodside has sought to follow the established, effective and respectful means of communication used by Native Title Representative Bodies and nominated representative corporations (including PBCs) with their respective First Nations communities. Woodside follows these processes for the appropriate broad capture of individuals' awareness of our activities, to self-identify (Section 5.5.2.2), and to provide feedback to inform the management of environmental impacts and risks.

Using these tools, Woodside communicates information about Environment Plans by:

- advertising in relevant newspapers. This encourages self-identification, by advertising proposed activities widely through newspapers that have national and intra-state circulation, i.e., Koori Mail, National Indigenous Times, The West Australian;
- creating carefully considered Consultation Summary Sheets with information developed by an Indigenous member of the First Nations Team to remove jargon and provide relevant information for people to have informed understandings about the activities;
- direct contact through nominated representative corporations;
- utilising social media (ie. Facebook/Instagram), texts and emails. These mediums are the preferred communication methods used by Traditional Custodians throughout Western Australia and on that basis used by Native Title Representative Bodies and other government agencies and industry, to engage with Traditional Custodians or call meetings. First Nations woman, Professor Bronwyn Castle through 10 years of research found "Social media is an intrinsic part of daily life. The use of Facebook is around 20 per cent higher [among First Nations people] than the national average across all geographical locations" (Social media mob: being Indigenous online, Professor Bronwyn Carlson (2018));
- For ongoing consultation post regulation 11A consultation, Woodside introduced a Program of Ongoing Engagement with Traditional Custodians which sets out the commitment to ongoing engagement and support to care for and manage country, including Sea Country. The program was developed in response to Traditional Custodian feedback;
- Woodside has members of its First Nations team who are based in Karratha and Roebourne and who serve as on-Country points of contact for First Nations organisations and individuals. These team members have broad local knowledge and established, on-the-ground relationships within communities. This helps contribute to positive outcomes including encouraging First Nations attendance and involvement at Woodside's information sessions and Community roadshows. Team members on the ground engage in a great deal of preparatory work including by distributing information and providing notice to the community to support First Nations attendance at information sessions and Community roadshows;
- From the commencement of engagement with Traditional Custodians, Woodside seeks direction on how they prefer to be consulted and has consulted accordingly. Consultation processes that are informed by Traditional Custodians and co-designed on a case-by-case basis and includes their direction as to cultural protocols, structure of consultation and whom to appropriately consult with (such as elders).
- Holding meetings on country at a place and time agreed with the Traditional Custodians and offering and providing financial assistance for meeting expenses (as appropriate);

- Providing information specifically designed to be easily understood, to reach all relevant people, and give a reasonable period of time for those people to make an informed assessment of the possible consequences of the proposed activity on them.

5.5.2.1 Identification of Relevant Persons

In order to undertake consultation, Woodside has developed a methodology for identifying all relevant persons, in accordance with regulation 11A(1) of the Regulations (Section 5.2 and 5.3).

Specific to Woodside's approach for identifying relevant Traditional Custodians, Woodside's First Nations Communities Policy and consultation approach is guided by Traditional Custodians by directing consultations through their nominated representative corporation. This has been implemented by Woodside through consultation with a nominated representative corporation where that corporation has advised Woodside that it acts as the representative body for a Traditional Custodian group and has requested that Woodside engage with it as the representative body for that Traditional Custodian group.

Woodside asks nominated representative corporations (such as PBCs) and Native Title Representative Bodies to identify individuals that should be consulted, and enables individuals to self-identify in response to national and local advertising, social media and community engagement opportunities (Section 5.5.2.3 and 5.9.1). Where there is a nominated representative corporation for an area, unless directed by the nominated representative corporation, Woodside does not directly approach individuals for consultation, because this has the potential to undermine the role of the nominated representative corporations. Approaching individuals directly is a practice that is no longer considered acceptable because of divisions it has been shown to cause in communities. In addition to asking for the identification of individuals, Woodside also asks nominated representative corporations to distribute consultation information to whomever the nominated representative corporations deem appropriate including members of the nominated representative corporations who are communal rights holders.

Having said this, as set out in further detail in Section 5.5.2.2 below, individuals are also given the opportunity to self-identify, consult and provide their own feedback on the proposed activity. When approached in this way, Woodside will engage individuals as relevant persons and will also (subject to any confidentiality or cultural restrictions) advise the nominated representative body of the consultation where it relates to cultural values. These methods of consultation are consistent with requirements for notification under the Native Title Act 1993 (Cth), such as under the future act provisions (section 29), which requires notification of the Native Title Representative Body, the PBC (or nominated representative) and notification through newspapers. The notification process has been selected as a respectful, practical and pragmatic analogue for consultation with First Nations peoples, rather than requiring members to be notified via a formal authorisation process which aims to seek, from members, authorisation of agreements and native title/compensation claims under the Native Title Act 1993 (Cth) .

In this consultation, Woodside requested nominated representative corporations to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their members. However, Woodside recognises that the process is voluntary and that it cannot compel nominated representative corporations (such as PBCs) to do so. Woodside also recognises that it would not be appropriate to seek to audit the nominated representative corporations for compliance with any member consultation request.

5.5.2.2 Opportunity to Self-identify and Identifying Other Individuals

Woodside requests nominated representative corporations and the Native Title Representative Bodies to identify other individuals to consult with or individuals who may seek to self-identify for a proposed activity. Woodside also advertises broadly through Indigenous, national and local advertising, social media and community engagement opportunities (as described in Section 5.9.1) to provide individuals with an opportunity to consult. Woodside does not directly approach individuals for consultation, as this undermines the role of the nominated representative corporations (Section

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.5.2.1). Woodside's approach to providing individual Traditional Custodians the opportunity to self-identify and consult for an Environment Plan is as follows:

- Woodside applies the principles of self-determination when consulting with Traditional Custodians by consulting through the Traditional Owners' authorised representative entities.
- Recognising the function of a PBC to represent communal interests and manage cultural values, Woodside requests that the information provided to representative entities is provided to their members but Woodside recognises the process is voluntary and Woodside cannot compel them to do so nor seek to audit the representative entities for compliance with any request
- Representative entities cannot provide membership details to Woodside due to individual confidentiality requirements.
- Woodside requests advice as to who else Woodside should be consulting but recognises the process is voluntary and cannot compel nominated representative corporations to provide this information.
- Modern Indigenous engagement practises rely on the building and maintaining of respectful relationships. Most nominated representative corporations to date have requested the building of that relationship, where one is not already in place.
- While Woodside has, in some cases, approached individual directors and elders outside of this process due to requirements imposed in Environment Plan consultation, this approach is considered inappropriate by modern Indigenous engagement standards, fundamentally undermining the authority of the authorised representative entity and can be detrimental to the relationship.

For this proposed activity, Woodside requested nominated representative corporations (including PBCs) and Native Title Representative Bodies to identify any potential individual relevant persons for consultation, and to distribute consultation materials to their member base. However, Woodside recognises the process is voluntary and it cannot compel them to do so nor seek to audit the representative entities for compliance with any request. Woodside has not been directed to engage individual Traditional Custodians by nominated representative corporations for this proposed activity. Woodside has nevertheless provided reasonable opportunity for individual Traditional Custodians to engage in consultation through appropriate and adapted consultation methods.

5.5.2.2.1 Sufficient Information

Woodside recognises that the information sufficient to allow a person or organisation to make an informed assessment of the possible consequences of the proposed activity on their functions, interests or activities may vary and also may depend on the degree to which a relevant person is potentially affected.

Woodside produces a Consultation Information Sheet for each Environment Plan which is provided to relevant persons and organisations to provide the opportunity for feedback on the activity (Section 5.4.1). In response to Traditional Custodians' feedback, Woodside has tailored effective consultation methods for its activities, specifically designed for Traditional Custodians, so that information is provided in a form that is readily accessible and appropriate. The targeted Consultation Summary Sheet (as described in Section 5.9.1) developed and reviewed by Indigenous representatives so that content is appropriate to the intended recipients, is then provided to relevant Traditional Custodian groups. Phone calls are made to provide context to the consultation.

Where face to face consultation meetings are requested, Woodside coordinates engagement at the Traditional Custodians' location of choice (where practicable) and with their nominated attendees. Key project personnel, environmental and First Nations relations experts are typically present to enable effective communication and prompt response to questions. Materials for these sessions incorporate visual aids such as photos, maps and videos, and plain language suitable for people with a non-technical background.

Woodside has sought to provide sufficient information to individual members of nominated representative corporations (such as PBCs) by providing information to representative bodies and suggesting dissemination with members. However, Woodside recognises consultation is voluntary and it cannot compel them to do so nor would it be appropriate to seek to audit the representative entities for compliance with any request.

5.5.2.3 Reasonable Period for Consultation

Woodside seeks to consult in order to support preparation of its Environment Plan. Woodside recognises that what constitutes a reasonable period for consultation should be considered on a case-by-case basis, with reference to the nature, scale and complexity of the activity (Section 5.4.2.)

5.5.2.4 Discharge of Regulation 11A

In relation to Traditional Custodian relevant persons (and all relevant persons), Woodside has discharged its duty under regulation 11A. Woodside considers that consultation under regulation 11A is complete (Section 5.4.3).

5.6 Providing Feedback and Assessment of Merit of Objections or Claims

There are a number of ways in which feedback can be provided. Feedback can be provided through the Woodside feedback email or via the Woodside feedback toll free phone line as outlined in the Consultation Information Sheet and the Woodside website. Where appropriate, consultation may also be supported by phone calls or meetings. An Environment Plan feedback form is also available on Woodside's website enabling stakeholders to provide feedback on proposed activities, or to request additional information.

Woodside consults widely on its EPs and notes that feedback is received in various forms. Feedback that is considered inappropriate or that puts the environment, health, safety or wellbeing of Woodside employees or operations at risk will not be tolerated. Woodside respects people's rights to protest peacefully and lawfully but actions that put the environment, health, safety or wellbeing of Woodside employees or operations at risk go beyond those boundaries.

Woodside accepts feedback and engages in consultation in order to achieve the aims set out in Section 5.2. Woodside recognises that there are persons and organisations that take a view that Woodside's operations and/or growth projects should be stopped or at least delayed as far as possible. Whilst Woodside assesses the merits of objections or claims received, it acknowledges NOPSEMA's guidance in its brochure entitled *Consultation on offshore petroleum environment plans information for the community*, which states that relevant persons are free to respond on any matter and raise any concern, however this may not be able to be considered if it is outside the scope or purpose of the environment plan and approval process, for example, statements of fundamental objection to offshore petroleum activities or information containing personal threats or profanities.

Feedback from relevant persons is reviewed and an assessment of the merits is made of information provided as well as objections or claims about the adverse impact of each activity to which the EP relates. This might, for instance, be done through a review of data and literature and for relevance to the nature and scale of the activity outlined in the EP. Consistent with the aim of consultation in Section 5.2, Woodside will consider information received when reviewing and designing measures to put in place to minimise harm to relevant persons and where reasonable or practical to further manage impacts and risks to ALARP and acceptable levels.

Woodside considers feedback during consultation from relevant persons and other persons Woodside chose to contact (see Section 5.3.4). This information is summarised in Appendix F, Table 1 and Table 2 of the EP and includes a statement of Woodside's response, or proposed response, if any, to each objection and claim.

In accordance with regulation 9(8) of the Environment Regulations, sensitive information (if any) in an EP, and the full text of any response by a relevant person to consultation under regulation 11A, must be contained in the sensitive information part of the plan and not anywhere else in the plan.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

5.7 Ongoing Consultation

Consultation can continue to occur during the life of an EP, including after an EP has been accepted by NOPSEMA.

As per Woodside’s ongoing consultation approach (refer to Section 7.17.2), feedback and comments received from relevant persons continue to be assessed and responded to, as required, throughout the life of an EP, including during its assessment and once accepted, in accordance with the intended outcome of consultation (as set out in Section 5.2).

Should consultation feedback be received following the acceptance of an EP that identifies a measure or control that requires implementation or updates to meet the intended outcome of consultation (see Section 5.2), Woodside will apply its Management of Change and Review process as appropriate (see Section 7.15).

5.8 Woodside’s Methodology to Identify Relevant Persons

5.8.1 Identification of Relevant Persons Under Regulation 11A(1)(a), (b) and (c)

Woodside’s methodology for identifying relevant persons under regulations 11A(1)(a), (b) and (c) is as follows:

- Woodside considers the defined responsibilities of each of the departments and agencies to which the activities in the EMBA to be carried out under the EP may be relevant. This list of relevant department and agencies is formulated by reference to the responsibilities of the government departments as set out on their websites, in NOPSEMA’s *GL1887 – Consultation with Commonwealth agencies with responsibilities in the marine area guideline* (January 2023), which describes where the Department is a relevant agency under the Environment Regulations, as well as experience and knowledge that Woodside has gained from years of operating in relation to the departments and agencies which Woodside has historically consulted over the years. This list is revised from time to time, for example, for the purposes of to accommodating government restructures, renaming of departments, shifting portfolios and/or to account for new agencies that might arise.
- Woodside has categorised government department or agency groups as follows:

Government departments / agencies – marine	Agencies with legislated responsibilities for use of the marine environment.
Government departments / agencies – environment	Agencies with legislated responsibilities for the protection of the marine environment.
Government departments / agencies – industry	The legislated Department of the responsible Commonwealth, State or Northern Territory Minister for Industry.

- Woodside considers each of the responsibilities of the departments and agencies and determines whether those responsibilities overlap with potential risks and impacts specific to the proposed petroleum activity in the EMBA. The assessment is both activity and location based.
- Woodside acknowledges the roles and responsibilities of government departments and agencies acting on behalf of various industry participants. For example, AMSA – Marine Safety is responsible for the safety of vessels and the seafarers who are operating in the domestic commercial shipping industry and AHO is responsible for maritime safety and Notices to Mariners. To undertake the Petroleum Activities Program in a manner that prevents a substantially adverse effect on the potential displacement of marine users, Woodside therefore consults AMSA – Marine Safety and AHO on its proposed activities. Woodside considers each of the responsibilities of the departments and agencies and determines those that would either be involved in the incident response itself or in relation to the regulatory or decision-making capacity with respect to planning for the unlikely event of a worst-case hydrocarbon release

incident response specific to the Petroleum Activities Program. Feedback received, if any, is assessed in accordance with the intended outcome of consultation (as set out in Section 5.2).

- The list of those government departments and agencies assessed as relevant is set out in Table 5-3.

Feedback received, if any, is assessed in accordance with the intended outcome of consultation (as set out in Section 5.8) and summarised at Appendix F, Table 1 and Table 2 as appropriate to the relevance assessment.

Woodside does not consult with departments or agencies with interests that do not overlap with risks and impacts specific to the proposed petroleum activity in the EMBA or would not be involved in incident response planning. For instance, in this EP, Woodside has not consulted with the department for the Minister of the Northern Territory because there is no overlap given that the proposed activities are in Commonwealth waters offshore of Western Australia.

5.8.2 Identification of Relevant Persons Under Regulation 11A(1)(d)

Relevant persons under regulation 11A (1)(d) are defined as a person or organisation whose functions, interests or activities may be affected by the activities to be carried out under the EP, or a revision of the EP. In identifying relevant persons, Woodside considers:

- the planned activities to be carried out under this EP (described in Section 3); and
- the EMBA by unplanned activities (identified in Section 4 and assessed in Section 6).

To identify relevant persons who fall within regulation 11A(1)(d), Woodside adopts the following methodology, and then undertakes consultation with relevant persons which is set out further in Section 5.8.

- As a general proposition, Woodside assesses whether a person or organisation is a relevant person having regard to:
 - whether a person or organisation has functions interests or activities or that overlap with the PAA and EMBA; and
 - whether a person or organisation's functions, interests or activities may be affected by Woodside's proposed planned or unplanned activities.
- This assessment will include applying professional judgement, knowledge and current literature.
- Further, to assist in identifying the full range of relevant persons, Woodside considers the impacts and risks associated with its proposed activities and considers the broad categories of relevant persons who may be affected by the activities. For this EP, the broad categories are identified in Table 5-1 below and identification methodology applied as set out in Table 5-2.
- The list of those persons or organisations assessed as relevant and persons or organisations Woodside chose to contact is set out in Table 5-3.
- Feedback received, if any, is assessed in accordance with the intended outcome of consultation (as set out in Section 5.2) and applying the categories of relevant persons methodology outlined in Table 5-2, as appropriate.
- Feedback from relevant persons is summarised at Appendix F, Table 1. Feedback from persons assessed as not relevant but whom Woodside chooses to contact or self-identified and Woodside assessed as not relevant are summarised at Appendix F, Table 2.

Table 5-1: Categories of relevant persons

Category	Explanation
Commercial fisheries and peak representative bodies	Commonwealth or State Commercial Fishery with a fishery management plan recognised under the Commonwealth <i>Fisheries Management Act 1991</i> (Cth) and Western Australian <i>Fish Resources Management Act 1994</i> (WA), which may be amended from time to time. Commonwealth peak fishery representative bodies are identified by AFMA. WAFIC is the peak representative body for state fishers in Western Australia.
Recreational marine users and peak representative bodies	Charter boat, tourism and dive operators identified by DPIRD specific to the location of the proposed activity. Representative bodies are the recognised peak organisation(s) for recreational marine users.
Titleholders and Operators	Registered holder of an offshore petroleum title or GHG title governed by the <i>OPGGGS Act</i> and associated regulations.
Peak industry representative bodies	Recognised peak organisation(s) for the oil and gas sector.
Traditional Custodians (individuals and/or groups/entity)	Traditional Custodians are First Nations Australians who hold cultural rights and interests, or have cultural functions or perform cultural activities over particular lands and waters. Where a First Nations person, group or entity self-identifies and/or asserts cultural rights, interests, functions or activities they will be included in the definition of Traditional Custodian for the purpose of this Environment Plan.
Nominated Representative Corporations	Nominated representative corporations are Traditional Custodians' nominated representative institutions such as Prescribed Body Corporates (PBC). PBCs are established under the Native Title Act 1993 by Traditional Custodians to represent their entire Traditional Custodian group (defined broadly by reference to descents from an ancestor set who were known to be the Traditional Custodians at the time of European colonisation) and their interests including, among other things, management and protection of cultural values.
Native Title Representative Bodies	A Representative Aboriginal/Torres Strait Islander Bodies (RATSIB) is a regional organisation appointed under the Native Title Act 1993 (NTA) with prescribed functions, set out in Part 11 of the Native Title Act 1993, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies.
Historical heritage groups or organisations	Legislated or government enlisted groups or organisations responsible for the management of marine heritage.
Local government and recognised local community reference/liaison groups or organisations	Local government governed by the <i>Local Government Act 1995</i> (WA) which is responsible for representing the local community. Recognised local community reference/liaison group or organisation in relation to oil and gas matters.
Other non-government groups or organisations	Non-government organisation with public website material targeting the proposed activity.
Research Institutes and local conservation groups or organisations	Research institutes are government or private institutions that conduct marine or terrestrial research. Local conservation groups are local non-government organisation that regularly conduct conservation activities focused on the local environment or wildlife.

Table 5-2: Methodology for identifying relevant persons within the EMBA undertaken under subcategory 11A(1)(d) – by category

Category	Relevant person identification methodology
<p>Commercial fisheries (Commonwealth and State) and peak representative bodies</p>	<p>Woodside assesses relevance for commercial fisheries (Commonwealth and State) and their representative bodies using the following next steps in its methodology:</p> <ul style="list-style-type: none"> • Defining the parameters having regard to timing, location and duration of the proposed petroleum activity. • Confirming whether the EMBA overlaps with the fisheries management area (i.e. the spatial area the fishery is legally permitted to fish in) (see Section 4.9.2). • Woodside acknowledges WAFIC’s consultation guidance¹² (accessed on 2 February 2023), that titleholders develop separate consultation strategies for significant unplanned events (for example oil spill) where titleholders can demonstrate the likelihood of such events occurring is extremely low. WAFIC’s guidance is that consultation on unplanned events resulting in an emergency scenario should only be undertaken if an incident occurs (see Appendix J). • For Commonwealth and State commercial fisheries, Woodside assesses the potential spatial and temporal extent for interaction with the fishery by reviewing AFMA ABARES and DPIRD Fishcube data within the Operational Area and EMBA (see Section 4.9.2). <p>Assessment of relevance:</p> <ul style="list-style-type: none"> • State commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.9.2) are assessed as relevant to the proposed activity. Woodside acknowledges WAFIC’s consultation guidance¹ (see above) and applies this by: <ul style="list-style-type: none"> - directly consulting fishery licence holders that are assessed as having a potential for interaction in the Operational Area; and - consulting fisheries that are assessed as having a potential for interaction in the EMBA via WAFIC. • Commonwealth commercial fisheries that have been assessed as having a potential for interaction within the Operational Area or EMBA (see Section 4.9.2) are assessed as relevant to the proposed activity. • If Woodside has identified that a Commonwealth or State fishery is a relevant person, then Woodside also consults the fisheries relevant representative body. For example, WAFIC represents the interests of State fisheries in Western Australia. If a state fishery is identified as relevant, Woodside would also identify WAFIC as relevant. Recognised Commonwealth fishery representative bodies are identified by AFMA via its website. WAFIC is the only recognised state fishery representative body.
<p>Recreational marine users and peak representative bodies</p>	<p>Woodside assesses relevance for recreational marine users and peak representative bodies using the following next steps in its methodology:</p> <ul style="list-style-type: none"> • From Woodside knowledge and operating experience, knowledge of recreational marine users in the area. This assessment is both activity and location based. • Defining the parameters having regard to timing, location and duration of the proposed petroleum activity. • Assessing the potential spatial and temporal extent for interaction with recreational marine users by reviewing DPIRD Fishcube data to assess whether there has been activity within the EMBA in the past 5 years. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> • Recreational marine users that have been active in the past 5 years within the EMBA are assessed as relevant to the proposed activity. Woodside is provided with the contact details of charter, boat tourism and dive operators specific to the region of the EMBA by DPIRD to consult with the relevant persons. • If Woodside has identified recreational marine users as relevant persons, then Woodside also consults identified peak recreational marine user representative bodies. For example, Recfishwest represents the interests of recreational fishers.

¹² [Consultation Approach for Unplanned Events - WAFIC](#)

Category	Relevant person identification methodology
	<p>These representative bodies are identified via Woodside’s existing consultation list, which is updated as appropriate via advice from known groups and DPIRD.</p>
<p>Titleholders and Operators</p>	<p>Woodside assesses relevance for other titleholders and operators using the following next steps in its methodology:</p> <ul style="list-style-type: none"> • Using WA Petroleum Titles (DMIRS-011) to determine overlap with other Titleholders or Operators permit areas within the EMBA. • From Woodside knowledge and operating experience, knowledge of other operators in the area. • Woodside produces a map showing the outcome of this assessment. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> • Titleholders and Operators whose permit areas are identified as having an overlap within the EMBA are assessed as relevant.
<p>Peak industry representative bodies</p>	<p>Woodside assesses relevance for peak industry representative bodies using the following next steps in its methodology:</p> <ul style="list-style-type: none"> • Review of peak industry representative bodies responsibilities that Woodside actively participates in, with consideration of overlap between industry focus area and Woodside’s proposed activities within the EMBA. • Review of Woodside’s existing consultation list. • Website search to identify whether any additional peak industry representative bodies have been created whose responsibilities may overlap with Woodside’s proposed activities within the EMBA. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> • Peak industry representative bodies whose responsibilities are identified as having an overlap with Woodside’s proposed activities within the EMBA are assessed as relevant.
<p>Traditional Custodians (individuals and/or groups/entity) and Nominated Representative Corporations</p>	<p>Consistent with its understanding of the matters discussed in Section 4.9.1 and 5.5 to identify Traditional Custodian groups or individuals, Woodside:</p> <ul style="list-style-type: none"> • Uses existing systems of recognition to identify First Nations groups who overlap or are coastally adjacent to the EMBA (for example, recognition provided under native title or cultural heritage legislation, or marine park management plans, or identification by other First Nations groups or entities) (Section 4.9.1). • Notifies and invites consultation with First Nations people through their nominated representative corporation (for example PBCs); or, in the case of native title, and where appropriate, the Native Title Representative Body (Section 5.5.2.1). • Requests the nominated representative body to forward the notifications and invitations to consult to their members (members are individual communal rights holders) (Section 5.5.2.1) • Requests advice as to other First Nations groups or individuals that should be consulted (Section 5.5.2.1) • Requests the nominated representative body to provide consultation materials to its members (Section 5.5.2.2.1) • Advertises widely so as to invite self-identification and consultation by First Nations groups and/or individuals (Section 5.5.2.2.1) <p>Further detail to Woodside’s methodology is as follows.</p> <p>Woodside uses the databases of the National Native Title Tribunal (Section 4.9.1):</p> <ul style="list-style-type: none"> • to understand whether there are any Native Title Claims (historical or current) or determinations overlapping or coastally adjacent to the EMBA; • to understand whether there are any relevant Indigenous Land Use Agreements (ILUA), registered with the National Native Title Tribunal that overlap or are adjacent to the EMBA that may identify Traditional Custodians or representative bodies to contact regarding potential cultural values. <p>Where there is a positive determination of native title, contacting the PBC or, where their representative is a Native Title Representative Body contacting the Native Title Representative Body.</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	<p>Where appropriate, contacting the relevant Native Title Representative Body to request a list of any First Nations groups asserting Traditional Custodianship over an area of coastline adjacent to the EMBA.</p> <p>Review of Commonwealth and State Marine Park Management Plans that overlap the EMBA which may identify Traditional Custodians or representative bodies to contact regarding potential cultural values.</p> <p>In the WA context, any Aboriginal Corporation appointed as a Local Aboriginal Cultural Heritage Service (LACHS) under the Aboriginal Cultural Heritage Act 2021 for an area that overlaps the EMBA.</p> <p>First Nations groups or individuals identified by a Traditional Custodian, nominated representative corporation, Native Title Representative Body.</p> <p>Request to the PBC to distribute Woodside consultation materials through its membership. Woodside is unable to contact this membership through any other means.</p> <p>Woodside has a number of public notification and information sharing processes by which individual Traditional Custodians can become aware of the proposed activity, its risks and impacts, and self identify.</p> <p>Individuals that consider their functions, interests or activities may be affected by a proposed activity must self-identify for each Environment Plan. Woodside does not presume that self-identification for an activity, covered by another Environment Plan, automatically means that an individual/s functions, interest and activities may be affected by other activities where EMBA's overlap. This decision is for the individual to make. The public notification, information sharing, and consultation processes Woodside puts in place enables Traditional Custodians to become aware of proposed activities, assess any risks and impacts to their values, and enable individuals to self-identify.</p> <p>Assessment of relevance:</p> <ul style="list-style-type: none"> Traditional Custodian groups, entities or individuals and Nominated Representative Corporations who are identified through the above methodology and overlap or are coastally adjacent to the EMBA are assessed as relevant.
Native Title Representative Bodies	<p>Woodside assesses relevance for Native Title Representative Bodies using the following steps in its methodology (Section 4.9.1):</p> <ul style="list-style-type: none"> A Representative Aboriginal/Torres Strait Islander Bodies (RATSIB) is a regional organisation appointed under the Native Title Act 1993 (NTA) with prescribed functions set out in Part 11 of the Native Title Act 1993, which relate to: facilitation and assistance; certification; dispute resolution; notifications; agreement making. They are also known, and referred to here, as Native Title Representative Bodies. Review of National Native Title Tribunal RATSIB areas that overlap or are coastally adjacent to the EMBA. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> Where the area for which a Native Title Representative Body is recognised under the Native Title Act 1993, overlaps with the EMBA or is coastally adjacent to the EMBA, Woodside will assess the Native Title Representative Body as relevant.
Historical heritage groups or organisations	<p>Woodside assesses relevance for groups or organisations whose responsibilities are focused on historical heritage using the following next steps in its methodology:</p> <ul style="list-style-type: none"> Using the Australasian Underwater Cultural Heritage Database to assess any known records Maritime Cultural Heritage sites (shipwrecks, aircraft and relics) within the EMBA (Section 4.9.1). <p>Assessment of relevance:</p> <ul style="list-style-type: none"> Where there is a known underwater heritage site (shipwrecks, aircraft and relics) within the EMBA, the relevant group or organisation that manages the site will be assessed as relevant.
Local government and recognised local community reference/liaison groups or organisations	<p>Woodside assesses relevance for local government and recognised local community reference/liaison groups or organisations using the following next steps in its methodology:</p> <ul style="list-style-type: none"> Review of Woodside maps (developed based on data from the WA Local Government, Sport and Cultural Industries My Council database and WA Local Government Association (WALGA) Local Government Directory maps) to assess

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Category	Relevant person identification methodology
	<p>any overlap between the local government’s defined area of responsibility and the EMBA.</p> <ul style="list-style-type: none"> • Woodside hosts regular community reference/liaison group meetings. Members represent a cross-section of the community and local towns interests. Representatives are from community and industry and generally include, Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, Industry representative bodies, Community and industry organisations. Woodside considers these reference/liaison groups to be the appropriate recognised representatives of the local community for the oil and gas sector. • Woodside reviews the community reference/liaison group’s terms of reference to determine its area of responsibility and any overlap with the EMBA. For example, the Exmouth Community Liaison Group’s area of responsibility in relation to Woodside’s operational, development and planning activities, is defined in the terms of reference as the Exmouth sub-basin. Comparatively, the Karratha Community Liaison Group’s area of responsibility is the Pilbara region (i.e. onshore). <p>Assessment of relevance:</p> <ul style="list-style-type: none"> • The local government whose defined area of responsibility overlaps the EMBA is assessed as relevant. • The community reference/liaison group whose defined area of responsibility overlaps the EMBA is assessed as relevant and consulted collectively via the relevant reference/liaison group.
Other non-government groups or organisations	<p>Woodside assesses relevance for other non-government groups or organisations using the following next steps in its methodology:</p> <ul style="list-style-type: none"> • Review of Woodside’s existing consultation list. • Website search of registered non-government groups or organisations (i.e. registered with an Australian Business Number (ABN) and publicly available contact information) that may have public website material specific to the proposed activity at the time of development of the EP. • Organisation has a publicly available mission statement (or purpose) that clearly describes their collective functions, interests or activities. • Review of current website material to identify targeted information which demonstrates functions, interests or activities relevant to the potential risks and impacts associated with planned activities. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> • Registered non-government groups or organisations with current targeted public website material specific to the proposed activity at the time of developing the EP and who have demonstrated functions, interests or activities relevant to the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2) will be assessed as relevant.
Research institutes and local conservation groups or organisations	<p>Woodside assesses relevance for research institutes and local conservation groups or organisations using the following next steps in its methodology:</p> <ul style="list-style-type: none"> • Review of Woodside’s existing consultation list. • Website search for research institutes that may operate within the EMBA. This assessment is both activity and location based. • Website search for local conservation groups or organisations that regularly conduct conservation activities within the EMBA. <p>Assessment of relevance:</p> <ul style="list-style-type: none"> • Where there is known research being undertaken by a research institute within the EMBA, the research institute that is conducting the research will be assessed as relevant. • Local environmental conservation groups who regularly conduct conservation activities or have demonstrated conservation functions, interests or activities within

Category	Relevant person identification methodology
	the EMBA are assessed as relevant. This assessment is both activity and location based.

5.8.3 Identification of Relevant Persons Under Regulation 11A(1)

Woodside adopts a case-by-case approach for each EP to assess relevance under regulation 11A(1)(e).

5.8.4 Assessment of Relevant Persons for the Proposed Activity

The result of Woodside’s assessment of relevant persons in accordance with regulation 11A(1) is outlined at Table 5 and Appendix F, Table 1.

Persons or organisations that Woodside assessed as not relevant but nonetheless chose to contact at its discretion in accordance with Section 5.3.4 or self-identified and Woodside assessed as not relevant are summarised at Table 5-3 and Appendix F, Table 2.

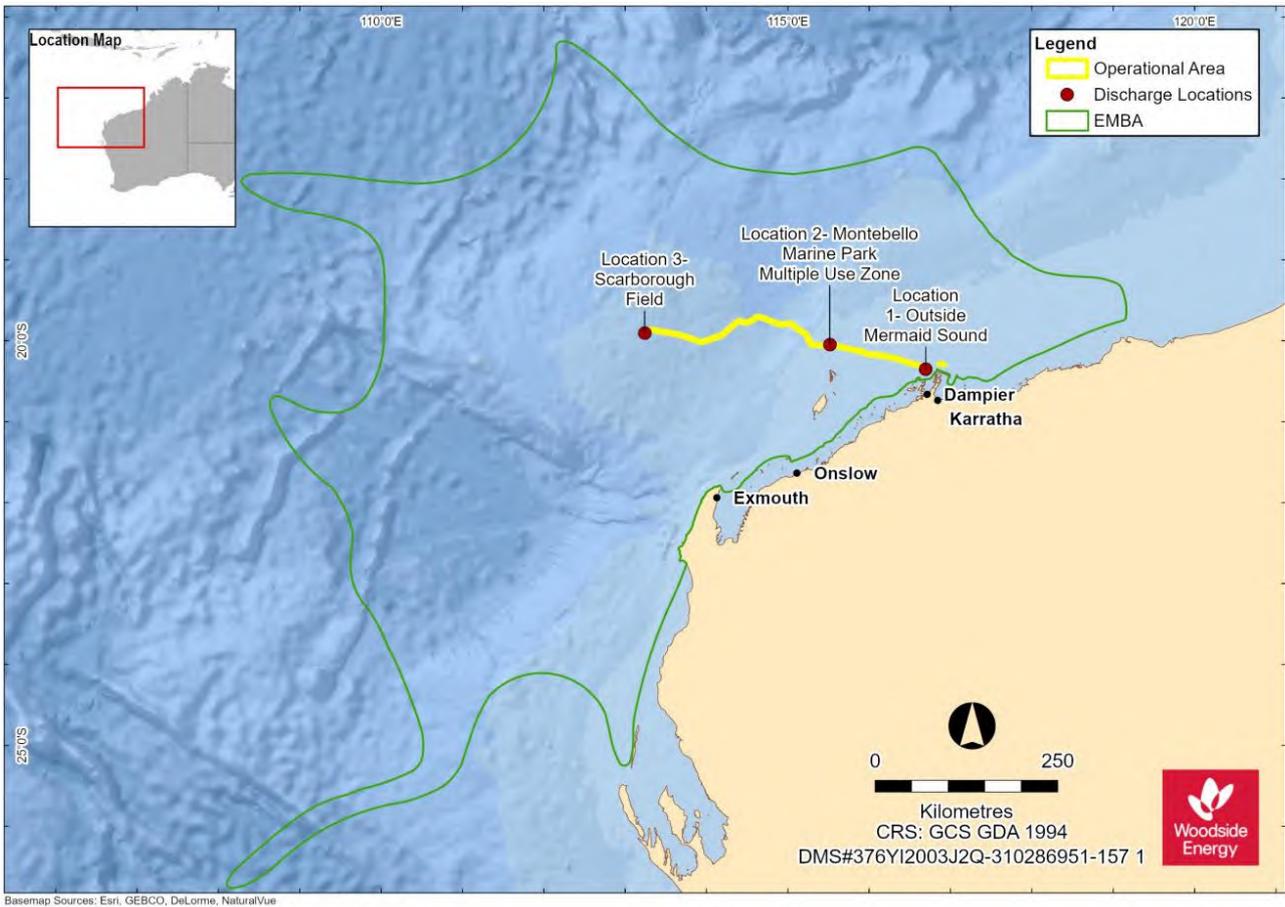

Figure 5-3: Operational Area and EMBA for this Environment Plan.

Table 5-3: Assessment of relevance

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Commonwealth and WA State Government Departments or Agencies – Marine			
Australian Border Force (ABF)	Responsible for coordinating maritime security	Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a). ABF’s responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Australian Fisheries Management Authority (AFMA)	Responsible for managing Commonwealth fisheries	Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a). The North West Slope and Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA. AFMA’s responsibilities may be relevant to the activity as the North West Slope and Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA.	Yes
Australian Hydrographic Office (AHO)	Responsible for maritime safety and Notices to Mariners	Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a). AHO’s responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Australian Maritime Safety Authority (AMSA) – Marine Safety	Statutory agency for vessel safety and navigation	Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a). AMSA – Marine Safety’s responsibilities may be relevant to the activity as there are proposed vessel activities.	Yes
Australian Maritime Safety Authority (AMSA) – Marine Pollution	Legislated responsibility for oil pollution response in Commonwealth waters	Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a). AMSA – Marine Pollution’s responsibilities may be relevant to the activity as the proposed activity has a hydrocarbon spill risk which may require AMSA response in Commonwealth waters.	Yes
Department of Agriculture, Fisheries and Forestry (DAFF) – Fisheries	Responsible for implementing Commonwealth policies and programs to support agriculture,	Woodside has applied its methodology for ‘Government departments / agencies – marine’ under regulation 11A(1)(a).	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
(formerly DAWE)	fishery, food and forestry industries	The North West Slope and Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA. DAFF – Fisheries' (formerly DAWE) responsibilities may be relevant to the activity as the North West Slope and Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA.	
Department of Defence (DoD)	Responsible for defending Australia and its national interests.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 11A(1)(a). DoD's responsibilities may be relevant to the activity as defence training areas lie within the EMBA.	Yes
Department of Primary Industries and Regional Development (DPIRD)	Responsible for managing State fisheries	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 11A(1)(b). Marine Aquarium Managed Fishery, Mackerel Managed Fishery (Area 2 and 3), Pilbara Crab Managed Fishery, Specimen Shell Managed Fishery, Nickol Bay Prawn Managed Fishery, Western Australian Sea Cucumber Fishery, Pilbara Trawl Fishery, Pilbara Trap Fishery, Pilbara Line Fishery, West Coast Deep Sea Crustacean Managed Fishery and Onslow Prawn Managed Fishery are active in the Operational Area. Exmouth Gulf Prawn Managed Fishery, Gascoyne Demersal Scalefish Fishery, Shark Bay Crab Managed Fishery, Shark Bay Prawn Managed Fishery, Shark Bay Scallop Managed Fishery, West Coast Rock Lobster Managed Fishery, West Coast Deep Sea Crustacean Managed Fishery and Onslow Prawn Managed Fishery are active in the EMBA. DPIRD's responsibilities may be relevant to the activity as the government department responsible for State fisheries.	Yes
Department of Transport (DoT)	Legislated responsibility for oil pollution response in State waters	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 11A(1)(b). The proposed activity has a hydrocarbon spill risk, which may require DoT response in State waters.	Yes
Department of Planning, Lands and Heritage (DPLH)	Responsible for state level land use planning and management, and oversight of Aboriginal cultural heritage and built heritage matters.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 11A(1)(b). There is known Maritime Cultural Heritage overlapping the EMBA.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Pilbara Ports Authority	Responsible for the operation of the Port of Dampier.	Woodside has applied its methodology for 'Government departments / agencies – marine' under regulation 11A(1)(b). The proposed activity has the potential to impact Pilbara Ports Authority's responsibilities as the Operational Area and EMBA overlaps the Pilbara Ports Authority's area of responsibility.	Yes
Commonwealth and WA State Government Departments or Agencies – Environment			
Department of Agriculture, Fisheries and Forestry (DAFF) – Biosecurity (marine pests, vessels, aircraft and personnel) (formerly DAWE)	DCCEEW administers, implements and enforces the Biosecurity Act 2015. The Department requests to be consulted where an activity has the potential to transfer marine pests. DCCEEW also has inspection and reporting requirements to ensure that all conveyances (vessels, installations and aircraft) arriving in Australian territory comply with international health regulations and that any biosecurity risk is managed. The Department requests to be consulted where an activity involves the movement of aircraft or vessels between Australia and offshore petroleum activities either inside or outside Australian territory.	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(a). DAFF – Biosecurity's (formerly DAWE) responsibilities may be relevant to the proposed activities in the EMBA in the prevention of introduced marine species.	Yes
Department of Climate Change, Energy, the Environment and Water Agriculture (DCCEEW) (formerly DAWE)	Responsible for implementing Commonwealth policies and programs to support climate change, sustainable energy use,	Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(a). DCCEEW's (formerly DAWE) responsibilities may be relevant to the proposed activities in the EMBA as there are potential environmental impacts from the proposed activity.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
	<p>water resources, the environment and our heritage.</p> <p>Administers the Underwater Cultural Heritage Act 2018 in collaboration with the States, Northern Territory and Norfolk Island, which is responsible for the protection of shipwrecks, sunken aircraft and other types of underwater heritage and their associated artefacts in Commonwealth waters.</p>	<p>There are known Maritime Cultural Heritage overlapping the EMBA.</p>	
<p>Director of National Parks (DNP)</p>	<p>Responsible for the management of Commonwealth parks and conservation zones.</p>	<p>Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(a).</p> <p>DNP's responsibilities may be relevant to the activity as DNP requires an awareness of activities that occur within AMPs, and an understanding of potential impacts and risks to the values of parks (NOPSEMA guidance note: N-04750-GN1785 A620236, June 2020). Titleholders are required to consult DNP on offshore petroleum and greenhouse gas exploration activities if they occur in, or may impact on the values of marine parks, including where potential spill response activities may occur in the event of a spill (i.e. scientific monitoring).</p>	<p>Yes</p>
<p>Ningaloo Coast World Heritage Advisory Committee (NCWHAC)</p>	<p>Supports the DBCA to manage the Ningaloo Coast World Heritage Area.</p>	<p>Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(a).</p> <p>The proposed activity has the potential to impact NCWHAC's responsibilities as the EMBA overlaps the Ningaloo Marine Park.</p>	<p>Yes</p>
<p>Department of Biodiversity, Conservation and Attractions (DBCA)</p>	<p>Responsible for managing WA's parks, forests and reserves to achieve wildlife conservation and provide sustainable recreation and tourism opportunities.</p>	<p>Woodside has applied its methodology for 'Government departments / agencies – environment' under regulation 11A(1)(b).</p> <p>The EMBA for the proposed activities overlap WA parks, forests or reserves.</p> <p>Activities have the potential to impact marine tourism in the EMBA.</p>	<p>Yes</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Commonwealth and State Government Departments or Agencies – Industry			
Department of Industry, Science and Resources (DISR) (formerly DISER)	Department of relevant Commonwealth Minister.	Required to be consulted under regulation 11A(1)(a).	Yes
Department of Mines, Industry Regulation and Safety (DMIRS)	Department of relevant State Minister	Required to be consulted under regulation 11A(1)(c).	Yes
Commonwealth Commercial fisheries and representative bodies			
North West Slope and Trawl Fishery	Commonwealth commercial fishery	Woodside has applied its methodology for ‘Commercial fisheries (Commonwealth and State) and peak representative bodies’ under regulation 11A(1)(d). The fishery overlaps the EMBA and has been active in the EMBA within the last 5 years.	Yes
Southern Bluefin Tuna Fishery	Commonwealth commercial fishery	Woodside has applied its methodology for ‘Commercial fisheries (Commonwealth and State) and peak representative bodies’ under regulation 11A(1)(d). Although the fishery overlaps the EMBA it has not been active in the EMBA within the last 5 years. Woodside does not consider that the proposed activity will present a risk to licence holders, given since 1992, the majority of Australian catch has concentrated in south-eastern Australia. (Patterson et al., 2022). In addition, given fishing methods by licence holders for species fished in this fishery (Australia has a 35% share of total global allowable catch of Southern Bluefin Tuna, which is value-added through tuna ranching near Port Lincoln (South Australia), or fishing effort in New South Wales (Australian Southern Bluefin Tuna Industry Association).	No
Western Deepwater Trawl Fishery	Commonwealth commercial fishery	Woodside has applied its methodology for ‘Commercial fisheries (Commonwealth and State) and peak representative bodies’ under regulation 11A(1)(d). The fishery overlaps the EMBA and has been active in the EMBA within the last 5 years.	Yes
Western Skipjack Fishery	Commonwealth commercial fishery	Woodside has applied its methodology for ‘Commercial fisheries (Commonwealth and State) and peak representative bodies’ under regulation 11A(1)(d).	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		<p>Although the fishery overlaps EMBA, it has not been active in the EMBA within the last 5 years.</p> <p>Woodside does not consider that the activity will present a risk to licence holders, given the fishery spans the Australian Fishing Zone west of Victoria and the Torres Strait. The Fishery is not currently active and no fishing has occurred since 2009 (Patterson et al., 2022). In addition, interactions are not expected given the species' pelagic distribution fishing methods for species fished by licence holders.</p>	
Western Tuna and Billfish Fishery	Commonwealth commercial fishery	<p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).</p> <p>The fishery overlaps the EMBA and has been active in the EMBA within the last 5 years.</p>	Yes
Commonwealth Fisheries Association (CFA)	Represents the interests of commercial fishers with licences in Commonwealth waters	<p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).</p> <p>The North West Slope and Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA.</p> <p>CFA's functions, interests or activities may be relevant to the activity as the North West Slope and Trawl Fishery, Western Deepwater Trawl Fishery and Western Tuna and Billfish Fishery are active in the EMBA.</p>	Yes
Australian Southern Bluefin Tuna Industry Association (ASBTIA)	Represents the interests of the Southern Bluefin Tuna Fishery and Western Skipjack Fishery	<p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).</p> <p>The Southern Bluefin Tuna Fishery has been assessed as not relevant to the proposed activity. As the peak representative body for the Southern Bluefin Tuna Fishery, the ASBTIA has also been assessed as not relevant.</p> <p>Woodside has provided information to the ASBTIA at its discretion in line with Section 5.3.4 on AFMA advice that it expects all Commonwealth fishers who have entitlements to fish within the proposed area to be consulted, which can be through the relevant fishing industry associations.</p>	No
Tuna Australia	Represents the interests of the Western Tuna and Billfish Fishery	<p>Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).</p> <p>The Western Tuna and Billfish Fishery is active in the EMBA.</p> <p>Tuna Australia's functions, interests or activities may be relevant to the activity as the Western Tuna and Billfish Fishery is active in the EMBA.</p>	Yes

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Pearl Producers Association (PPA)	Peak representative organisation of The Australian South Sea Pearling Industry, with members in Western Australia and the Northern Territory	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). The Pearl Oyster Managed Fishery has been assessed as not relevant to the proposed activity. As the peak representative body for the Pearl Oyster Managed Fishery, the PPA has also been assessed as not relevant.	No
State Commercial fisheries and representative bodies			
Marine Aquarium Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years.	Yes
South West Coast Salmon Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). Although the fishery overlaps the Operational Area and EMBA, the fishery has not been active in the Operational Area or EMBA within the last 5 years. Woodside does not consider that the activity will present a risk to licence holders, given fishers are active south of Perth and from the beach (previous WAFIC advice).	No
Mackerel Managed Fishery (Area 2 and 3)	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years.	Yes
Pilbara Crab Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years.	Yes
West Coast Deep Sea Crustacean Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years.	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
Specimen Shell Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years.	Yes
Onslow Prawn Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years.	Yes
Pearl Oyster Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). Although the fishery overlaps the Operational Area and EMBA, the fishery has not been active in the Operational Area or EMBA within the last 5 years. Woodside does not consider that the activity will present a risk to licence holders given fishing methods and location for species fished by licence holders (fishing effort is mostly focussed in shallow coastal waters of 10-15 m depth, with a maximum depth of 35 m) (Lulofs et al. 2002).	No
Nickol Bay Prawn Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years.	Yes
WA North Coast Shark Managed Fishery	State commercial fishery	The WA North Coast Shark Fishery (WANCSF) management area extends from longitude 114°06'E to 123°45'E (Patterson et al., 2021). However, fishing activity has not been reported by this fishery since the 2008-2009 fishing season (Patterson et al., 2021). Accordingly, Woodside considers there to be no potential for interaction with this fishery within the EMBA.	No
Western Australian Sea Cucumber Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d). The fishery overlaps the Operational Area and EMBA and has been active in the Operational Area and EMBA within the last 5 years.	Yes
Exmouth Gulf Prawn Managed Fishery	State commercial fishery	Woodside has applied its methodology for 'Commercial fisheries (Commonwealth and State) and peak representative bodies' under regulation 11A(1)(d).	Yes

		Titleholder or Operator's permit areas overlaps the EMBA.	
National Energy Resource Australia (NERA) Collaborative Seismic Environment Plan Project (CSEP) acting for a consortium of operators	Titleholder or Operator	Woodside has applied its methodology for 'Additional Persons' and 'Titleholders and Operators' under regulation 11A(1)(d). During the course of preparing the EP, NERA CSEP self-identified and requested to be consulted. Titleholder or Operator's permit areas overlaps the EMBA.	Yes
Peak Industry Representative bodies			
APPEA	Represents the interests of oil and gas explorers and producers in Australia.	Woodside has applied its methodology for 'Peak Industry Representative bodies' under regulation 11A(1)(d). APPEA's responsibilities are identified as having an intersect with Woodside's planned activities in the EMBA.	Yes
Traditional Custodians and nominated representative corporations			
Murujuga Aboriginal Corporation (MAC)	Representative Aboriginal Corporation	Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 11A(1)(d). MAC is the Nominated Representative Corporation under the Burrup and Maitland Industrial Estates Agreement (BMIEA), which is coastally adjacent to the EMBA and underpins land access for the onshore component of the Scarborough Project. The EMBA does not overlap the Murujuga National Park. MAC was established to represent the members of competing Native Title claims over Murujuga, collectively known as the Ngarda Ngarli and comprising Mardudhunera, Ngarluma, Yaburara, Yindjibarndi and Wong-Goo-Tt-Oo people. The determination of the competing Native Title claims resulted in no native title being found over the lands subject to the BMIEA or below the low water mark. MAC also owns and co-manages the Murujuga National Park, is responsible for the Dampier Archipelago National Heritage Place and is progressing the World Heritage nomination of the Murujuga Cultural Landscape. Woodside has consulted with MAC in regard to the Scarborough Project area generally since 2018 and MAC has been involved in ethnographic surveys that included the planned activities of this EP.	Yes

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		As discussed further below, Woodside engaged YMAC as the Native Title Representative Body for the Yamatji and Pilbara regions of Western Australia to confirm the best approach to confirm additional cultural values (if any) for the broader Scarborough Project, the scope of which included the proposed activity for this EP. YMAC advised that the most appropriate stakeholders for the Scarborough project generally are MAC and NAC, who are not represented by YMAC (refer to Appendix F, Table 1).	
Ngarluma Aboriginal Corporation (NAC)	Representative Aboriginal Corporation	<p>Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 11A(1)(d).</p> <p>The Ngarluma People's native title determination area does not overlap the EMBA. The determination, for which NAC is the Registered Native Title Body Corporate, is coastally adjacent to the EMBA.</p> <p>The historical Ngarluma/Yindjibarndi native title claim overlaps the Operational Area.</p> <p>NAC is party to the Anketell Port, Infrastructure Corridor and Industrial Estates Agreement, which overlap the EMBA.</p> <p>NAC is party to the RTIO Ngarluma Indigenous Land Use Agreement (Body Corporate Agreement), which is adjacent to the EMBA.</p> <p>The EMBA overlaps the Dampier Commonwealth Marine Park, over which the North-west Marine Parks Network Management Plan specifies NAC as representing people whose sea country extends into the marine park which is valued for cultural identify, health and wellbeing.</p> <p>As noted above (and discussed further below), Woodside sought guidance from YMAC as the Native Title Representative Body for the Yamatji and Pilbara regions of Western Australia to confirm the best approach to confirm additional cultural values (if any) for the broader Scarborough Project, the scope of which included the proposed activity for this EP. YMAC advised that the most appropriate stakeholders for the Scarborough project generally are MAC and NAC, who are not represented by YMAC (refer to Appendix F, Table 1).</p>	Yes
Wirrawandi Aboriginal Corporation (WAC)	Representative Aboriginal Corporation	<p>Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 11A(1)(d).</p> <p>The Yaburara & Mardudhunera People determination, for which WAC is the Registered Native Title Body Corporate, overlaps the EMBA.</p>	Yes

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Stakeholder	Summary of responsibilities and/or functions, interests or activities	Assessment of relevance	Relevant person
		<p>WAC is party to the KM & YM ILUA and Cape Preston Project Deed (YM Mardie ILUA), which overlap the EMBA.</p> <p>WAC is party to the Cape Preston West Export Facility ILUA, which is coastally adjacent to the EMBA.</p>	
<p>Nganhurra Thanardi Garrbu Aboriginal Corporation (NTGAC)</p>	<p>Representative Aboriginal Corporation</p>	<p>Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 11A(1)(d).</p> <p>The Gnulli, Gnulli #2 and Gnulli #3 - Yinggarda, Baiyungu and Thalanyji People native title claim, the determination of which NTGAC and YAC are the Registered Native Title Bodies Corporate, overlaps the EMBA.</p> <p>The NTGAC is also party, with the WA State Government, to the Ningaloo Conservation Estate Indigenous Land Use Agreement (the ILUA) which overlaps the EMBA. The NTGAC is responsible for the joint management of the inner Ningaloo Marine Park (State Waters), the Cape Range National Park and new conservation areas extending along the Ningaloo Coast, which runs in parallel to the outer Ningaloo Marine Park in Commonwealth waters.</p> <p>The NTGAC is also party to the Gnarloo ILUA, which is coastally adjacent to the EMBA.</p> <p>The NTGAC's nominated representative is the YMAC and the NTGAC executive officer and contact officer pursuant to the Corporations (Aboriginal and Torres Strait Islander) Act 2006 is employed by YMAC. Woodside has therefore consulted the NTGAC, via YMAC.</p>	<p>Yes</p>
<p>Yinggarda Aboriginal Corporation (YAC)</p>	<p>Representative Aboriginal Corporation</p>	<p>Woodside has applied its methodology for 'Traditional Custodians and Nominated Representative Corporations' under regulation 11A(1)(d).</p> <p>The Gnulli, Gnulli #2 and Gnulli #3 - Yinggarda, Baiyungu and Thalanyji People native title claim, the determination for which NTGAC and YAC are the Registered Native Title Bodies Corporate, overlaps the EMBA.</p> <p>YAC is party to the Brickhouse and Yinggarda Aboriginal Corporation ILUA and Quobba – Yinggarda Pastoral ILUA, which are coastally adjacent to the EMBA.</p> <p>The YAC nominated representative was the YMAC and the YAC executive officer and contact officer pursuant to the Corporations (Aboriginal and Torres Strait Islander) Act 2006 is employed by YMAC. Woodside therefore consulted YAC, via YMAC. Woodside was advised that as of late April 2023, the nominated representative for YAC was now Gumala Aboriginal Corporation.</p>	<p>Yes</p>

		Woodside has assessed TWS's public website material and feedback, with the latter demonstrating an interest with the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2).	
World Wildlife Fund (WWF) Australia	Non-government organisation	Woodside has applied its methodology for 'Additional persons' and 'Other non-government groups or organisations' under regulation 11 A 1 (d) to determine WWF's relevance for the proposed activity. Woodside has assessed that WWF's public website material does not demonstrate an interest with the potential risks and impacts associated with planned activities in accordance with the intended outcome of consultation (as set out in Section 5.2). Woodside chose to contact WWF at its discretion in line with Section 5.3.4.	No
Research institutes and local conservation groups or organisations			
University of Western Australia (UWA)	Research institute	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 11 A 1 (d) to determine UWA's relevance for the proposed activity. There is known research being undertaken by the UWA that intersects within the EMBA.	Yes
Western Australian Marine Science Institution (WAMSI)	Research institute	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 11 A 1 (d) to determine WAMSI's relevance for the proposed activity. There is no known research being undertaken by WAMSI that intersects within the EMBA Woodside chose to contact WAMSI at its discretion in line with Section 5.3.4.	No
Commonwealth Scientific and Industrial Research Organisation (CSIRO)	Research institute	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 11 A 1 (d) to determine CSIRO's relevance for the proposed activity. There is no known research being undertaken by CSIRO that intersects within the EMBA. Woodside chose to contact CSIRO at its discretion in line with Section 5.3.4.	No
Australian Institute of Marine Science (AIMS)	Research institute	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 11 A 1 (d) to determine AIMS's relevance for the proposed activity. There is no known research being undertaken by AIMS that intersects within the EMBA.	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

		Woodside chose to contact AIMS at its discretion in line with Section 5.3.4.	
Cape Conservation Group	Local conservation group focused on protecting the terrestrial and marine environment of the North West Cape	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 11 A 1 (d) to determine CCG's relevance for the proposed activity. CCG's conservation activities have the potential to intersect with the EMBA as the EMBA overlaps North West Cape.	Yes
Protect Ningaloo	Local conservation group focused on protecting the Exmouth Gulf and Ningaloo Reef and Cape Range	Woodside has applied its methodology for 'Research institutes and local conservation groups or organisations' under regulation 11 A 1 (d) to determine CCG's relevance for the proposed activity. Protect Ningaloo's conservation activities have the potential to intersect with the EMBA as the EMBA overlaps North West Cape and Ningaloo Reef.	Yes
Other			
Save Our Songlines (SOS)	Representatives of Non-Government Organisation Save Our Songlines and/ or individuals [REDACTED] and/ or [REDACTED]	Woodside has applied its methodology for 'Traditional Custodians and nominated representative corporations' and 'Other non-government groups or organisations' under regulation 11A(1)(d) to determine Save Our Songlines (SOS) and/ or [REDACTED] and/ or [REDACTED] relevance for the proposed activity. During the course of preparing the EP, Save Our Songlines and/ or [REDACTED] and/ or [REDACTED] self-identified and requested to be consulted on Scarborough EPs. Woodside has assessed that SOS and/ or [REDACTED] and/ or [REDACTED] feedback demonstrates an interest with the proposed activity.	Yes
Woodside Come Clean	Campaign website	Woodside Come Clean is not a registered organisation (i.e. no Australian Business Number (ABN)) and has no contact details publicly available. As this is not a group or organisation, but rather a campaign website, it would not be reasonable for Woodside to consider relevance for the proposed activity, nor attempt to consult. Irrespective, Woodside has reviewed the Woodside Come Clean public website material and determined that the material does not demonstrate any intersect with potential direct impacts specific to the proposed petroleum activity, while remaining in accordance with the intended outcome of consultation (as set out in Section 5.2). Woodside notes that the Woodside Come Clean campaign website links to Say No to Scarborough Gas, which Woodside has consulted for the proposed activity.	No

5.9 Consultation Activities and Additional Engagement for the Scarborough Seabed Intervention and Trunkline Installation Environment Plan

Woodside has been conducting extensive consultation on the Scarborough Project since February 2018, when preliminary consultation for the Scarborough OPP commenced with interested and affected stakeholders.

Consultation aims to be inclusive, transparent, voluntary, respectful and two-way. Consultation for this Environment Plan was undertaken via advertising, emails, letters, information sheets, presentations, information sessions, phone calls and meetings.

- Woodside advertised the planned activities proposed for this EP in the national, state and relevant local newspapers including The Australian, The West Australian, Pilbara News (19 October 2022) and The Australian, The West Australian, Pilbara News, Midwest Times, North West Telegraph (18 January 2023) and Geraldton Times (20 January 2023) (see Appendix F, reference 6.1). Regional newspapers do not require subscription and are available and in some cases delivered directly to households. All communities within or adjacent to the EMBA had access to this information via this media. No direct comments or feedback were received from the advertisements.
- A Consultation Information Sheet was provided to relevant persons and persons Woodside chose to contact (see Section 5.3.4), which included details such as an activity overview, maps, a summary of key risks and/or impacts and management measures (Appendix F, reference 1.1).

An activity update Consultation Information Sheet was provided to relevant persons and persons Woodside chose to contact (see Section 5.3.4), which included an update regarding planned activities, information regarding the EMBA's for this EP and additional information relating to mitigation and management measures for this EP (Appendix F, reference 2.1).

- Since the commencement of the initial consultation period (August 2021), the Stakeholder Consultation Information Sheet (Appendix F, reference 1.1) has been available on the Woodside website and the activity update Consultation Information Sheet since January 2023 (Appendix F, reference 2.1). The Woodside Consultation Information Sheets include a toll-free 1800 phone number and Woodside's feedback email address (feedback@woodside.com.au).
- Additional targeted information was provided to relevant marine users including AHO and AMSA – Marine Safety (Appendix F, reference 1.4, 1.4.1, 1.4.2). The targeted information included maps and additional information relevant to the specific category of persons. The relevant persons had a 30-day period in which to provide feedback.
- Where appropriate, Woodside conducted phone calls and meetings with relevant persons.
- Where appropriate, targeted follow-up emails were sent to relevant persons who had not provided a response prior to the close of the target feedback period.
- While ensuring that the particulars of each activity (including description, planned and unplanned impacts and controls) are adequately covered, Woodside conducts consultation with relevant persons on all Scarborough Project activities for which they are relevant in a combined manner. This achieves efficiency for Woodside and the relevant person, and ensures that all activities are understood in their broader context.
- Woodside considered relevant person responses and assessed the merits and relevance of objections and claims about the potential adverse impact of the proposed activity set out in the EP, in accordance with the intended outcome of consultation (see Section 5.2).
- Consultation activities undertaken with relevant persons are summarised at Appendix F, Table 1.

- Engagement undertaken with persons or organisations Woodside assessed as not relevant but chose to contact (see Section 5.3.4 or self-identified and Woodside assessed as not relevant are summarised at Appendix F, Table 2).
- From 3 May 2023, Woodside commenced a geotargeted sponsored social media campaign (Appendix F, reference 6.2) to various local government authorities that are within or coastally adjacent to the EMBA for the proposed activities. The campaign provided the opportunity for individuals (including self-identified traditional custodians) who may be interested in Woodside's activities to participate in consultation. The campaign also advised persons or organisations on how they can find out about Woodside's proposed activities by visiting Woodside's website.
- Community information sessions
- Community Information Sessions were held in Roebourne on 5, 10, 19 and 24 May, 22 June, and 19 July 2023; in Exmouth on 17 June 2023; and Broome, Derby and Kununurra on 12, 13 and 15 June 2023 respectively. Ahead of the events, Woodside advertised the sessions via the means below which provided the opportunity for local individuals to become aware of the event and have access to experts and information about the activity. The methods used to promote these consultation opportunities were developed with input from Indigenous representatives and were adapted to incorporate culturally appropriate and accessible language to encourage engagement and understanding of Woodside's proposed activities:
 - Advertising in the Broome Advertiser and Kimberley Echo on 1 and 8 June 2023 (Appendix F, reference 6.3.1) and for the Karratha Community Session in the Pilbara News on 28 June 2023 (Appendix F, reference 6.4.3).
 - From 8 June 2023, Woodside commenced a geotargeted social media campaign along the coastline from Geraldton to Derby (Appendix F, reference 6.2) advertising the community information sessions. A Facebook information campaign was targeted in Exmouth to ensure it reached communities where the Exmouth Consultation Information Session was planned to be held. (Appendix F, reference 6.5.1) A Karratha Community Information Session was advertised via a Facebook post on 28 June 2023 (Appendix F, reference 6.4.3) and a geotargeted social media campaign from 16 June to 29 June 2023 (Appendix F, reference 6.4.3).
 - Directly contacting local Traditional Custodian groups to invite representatives to attend the Community Information Sessions and providing the event information (see Appendix F, Table 1).
 - Advertising in Roebourne with posters on four community boards and dropped posters to community locations; and put information and posters on the Roebourne Community Calendar (Appendix F, reference 6.4.1 and 6.4.2).
 - Representatives from Woodside, including project and environment personnel equipped to answer technical questions, attended the event. Copies of the Consultation Information Sheets and bespoke targeted Summary Consultation Information Sheets were available to attendees. Community members were able to engage with Woodside representatives to understand the proposed activity and how it may affect them, ask questions and provide their feedback.
- Community Information Sessions were held in Karratha on 28 and 29 June 2023. Woodside advertised the sessions (see below) providing the opportunity for individuals to become aware of the event and have access to information as well as people who can answer questions and provide information about the activity. The methods used to promote these consultation opportunities were developed with input from Indigenous representatives and were adapted to incorporate culturally appropriate and accessible language to encourage engagement and understanding of Woodside's proposed activities:

- Ahead of the 28 June 2023 event, a story was posted on Woodside’s Facebook page (Appendix F, reference 6.4.3) sharing details of its shopping centre stand where Consultation Information Sheets regarding planned and proposed activities were available, including the activities proposed under this Environment Plan.
- Ahead of the 29 June 2023 event, the Community Information Session was advertised in the Pilbara News), via a geotargeted social media campaign in Karratha and surrounding areas and by posting the event details on Woodside’s Facebook page (Appendix F, reference 6.4.3).
- Representatives from Woodside, including project and environment personnel equipped to answer technical questions, attended the event. Copies of the Consultation Information Sheets and bespoke targeted Summary Consultation Information Sheets were available to attendees. Community members were able to engage with Woodside representatives to understand the proposed activity and how it may affect them, ask questions and provide their feedback.
- Woodside had a stand at the annual FeNaCING Festival in Karratha on 5 and 6 August 2023. Members of Woodside’s Corporate Affairs and Operations teams actively engaged with the community to discuss proposed Environment Plan activities. Consultation Information Sheets for a number of Woodside Environment Plans including this Environment Plan were available. Approximately 2,000 people visited the Woodside stand (based on the number of completed consultation forms and questionnaires). This consultation opportunity was promoted in the Pilbara News on 2 August 2023, and a story appeared on the Woodside North West Facebook page on 2 August 2023. (Appendix F, reference 6.4.4).
- Woodside had a stand at the Passion of the Pilbara festival in Onslow on 18 August 2023. Members of Woodside’s Corporate Affairs team actively engaged with the community to discuss proposed Environment Plan activities. Consultation Information Sheets for a number of Environment Plans including this Environment Plan were available. Approximately 100 people visited the Woodside stand.
 - This consultation opportunity was promoted in a story on the Woodside North West Facebook page on 17 August 2023. (Appendix F, reference 6.4.5).
- Woodside consulted the Karratha, Port Hedland and Roebourne communities on Environment Plan activities during 18–20 September 2023. Members of Woodside’s Corporate Affairs, First Nations, Environment and Scarborough Project teams actively engaged the community to discuss proposed Environment Plans, including the Scarborough and Browse projects.
 - 18 September 2023: Karratha Shopping Centre 8am–12pm; Red Earth Arts Precinct 3–6pm. Estimated number of people consulted: 20;
 - 19 September 2023: Port Hedland, South Hedland Square 10am–5pm. Estimated number of people consulted: 20;
 - 20 September 2023: Roebourne, Woodside Office 10am–4pm. Estimated number of people consulted: no attendance at the session due to Sorry Business and multiple Aboriginal corporation meetings which were unknown at the time of scheduling/planning engagements;
- These consultation opportunities were promoted in the Pilbara News on 13 September 2023, and via Facebook and Instagram social media campaigns from 6 to 16 September 2023. (Appendix F, reference 6.4.6).

5.9.1 Traditional Custodian Specific Consultation

In addition to the approaches above including community information sessions, additional activities were undertaken with relevant Traditional Custodians, which were specifically designed to provide for effective engagement with Traditional Custodians and so that information was provided in a form that was readily accessible and appropriate (Section 5.5). Consultation undertaken specifically with Traditional Custodians for this Environment Plan includes:

- Direct engagement with nominated representative corporations via the contact listed on the ORIC website, requesting advice on how they would like to be engaged and asking whether other members and/or individuals should be consulted. This has resulted in:
 - Meetings with directors, elders and any nominated representatives, on country or in Perth;
 - Requests and offers of resourcing to enable and support consultation;
 - Exchange of written feedback and correspondence;
 - A Summary Consultation Information Sheet, developed and reviewed by Indigenous representatives in collaboration with technical experts to ensure content is appropriate to the intended recipients, was provided to relevant Traditional Custodian groups (Appendix F, reference 2.1.1). and phone calls to provide context to the consultation made.
- Ongoing efforts were made to engage and develop relationships with these bodies via a variety of means such as email, phone calls, alternative contacts, texts, social media and in some cases physical visits.
- Consultation meetings with attendees decided by Traditional Custodian groups, supported by senior Woodside representatives, subject matter experts, First Nations Relations advisers with skills and experience in community engagement. Meetings are developed through a two-way consultation process to ensure effective information sharing via:
 - Mutually agreed agenda avoiding time pressure;
 - Encouraging Traditional Custodian attendees to control the pace of the meeting and pause at any time to ask questions, seek clarification or provide feedback;
 - Visual aids such as posters, presentations, simplified technical videos and real-world pictures and footage;
 - Emphasis on potential planned and unplanned risks and impacts of the activity;
 - Ample opportunity for questions and feedback;
 - Discussion about ongoing relationship development and opportunities;
 - Distribution of hard-copy Consultation Information Sheets (Appendix F, reference 2.1) and Summary Consultation Information Sheets (Appendix F, reference 2.1.1.)
 - Meeting all costs such as sitting fees, travel, legal support and executive support and other support required.
- Woodside has a geotargeted sponsored social media campaign (Appendix F, reference 6.2) to various communities that are coastally adjacent to the EMBA for the proposed activities.
 - The wide-reaching campaign brought the proposed activity to the attention of persons who may be interested and advised persons or organisations how they can find out about Woodside's proposed activities by visiting Woodside's website, which details the intent of consultation with relevant persons under the Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Cth). The reach of this campaign is shown in Appendix F, reference 6.2 providing the opportunity to consult via over 139,000 views to date across various regions.

- These social media posts were developed with input from Indigenous representatives. Social media is a highly effective means to engage Indigenous audiences as outlined in Indigenous Digital Life (Professor Carlson, 2021). Advertisements used language and information appropriate to Indigenous audiences. Feedback from community engagements indicates a high level of penetration for this technique.

Woodside has employed a diverse range of techniques to allow relevant persons to become aware of the proposed activity and how it may affect their functions activities or interests, and understand their ability to provide feedback. The combination of engagement meetings, traditional print media, social media and face-to face community interaction was designed with input from Indigenous representatives and adapted to the audience, so that it provides a wide-ranging opportunity to consult.

6 ENVIRONMENTAL RISK ASSESSMENT, PERFORMANCE OUTCOMES, STANDARDS AND MEASUREMENT CRITERIA

6.1 Overview

This section presents the impact and risk analysis, evaluation and Environment Performance Outcomes (EPOs), Environmental Performance Standards (EPS) and Measurement Criteria (MC) for the Petroleum Activities Program, using the methodology described in Section 6 of this EP.

6.2 Impact and Risk Analysis and Evaluation

As required by Regulations 13(5) and 13(6) of the Environment Regulations, the following analysis and evaluation demonstrates that the identified impacts and risks associated with the Petroleum Activities Program are reduced to ALARP, are of an acceptable level and consider all operations of the activity, including potential emergency conditions. The impact assessment for planned activities has been based on the size of the Operational Area.

The impacts and risks identified during the ENVID workshops (including decision type, current risk level, acceptability of impacts and risks, and tools used to demonstrate acceptability and ALARP) have been divided into two broad categories:

- Planned activities (routine and non-routine) that have the potential for inherent environmental impacts.
- Unplanned events (accidents, incidents or emergency situations) with an environmental consequence, termed risks.

Within these categories, impact and safety risk assessment groupings are based on environmental aspects such as emissions and physical presence. In all cases, the worst-case risk was assumed.

The ENVID (performed in accordance with the methodology described in Section 2) identified 15 sources of environmental impacts and risks. A summary of the ENVID is provided in Table 6-3.

The activity specific ENVID workshop was conducted on 22 June 2021. Attendees included Woodside environment advisers and engineers, environmental scientists, hydrocarbon spill advisers, trunkline engineer and manager, and seabed intervention manager. Representatives from the seabed intervention and trunkline installation contractors were also present. The participants' breadth of knowledge, training and experience was sufficient to reasonably assure that the hazards that may arise in connection with the petroleum activity in this EP were identified.

The impact and risk analysis and evaluation for the Petroleum Activities Program indicate that all current environmental risks and impacts associated with the individual activities are reduced to ALARP and are of an acceptable level, as discussed further in Sections 6.7 and 0.

6.2.1 Concurrent operations and cumulative impacts

The Scarborough OPP (SA0006AF0000002, Rev 5; Section 8) assesses the potential cumulative impact of the Scarborough Project and other activities / developments. In addition, Woodside has assessed the cumulative impacts of the Petroleum Activities Program in relation to other Scarborough activities, that could realistically result in overlapping temporal and spatial extents (Figure 6-1).

Figure 6-1 shows proposed sequence of seabed intervention and trunkline installation activities and where these will occur along the Trunkline route (Kilometre Point on y-axis) over an indicative time (x-axis). The key can be used to see what vessel(s) are associated with each activity. Below the x-axis, humpback whale and pygmy blue whale migration time periods have been added, including the KP range of the migration BIAs; to help illustrate overlaps between these seasons and the Petroleum Activities Program. The figure shows that the primary opportunity for concurrent activities occurs in

the permit area WA-61-L where aspects of the Petroleum Activities Program will potentially be carried out at the same time as Scarborough drilling and completions activities. These overlaps are detailed in Table 6-1.

Shallow Water Lay Barge activities (such as anchoring) may extend into Commonwealth Waters, however there is no planned concurrent activities between the SWLB and PV due to temporal separation.

Cumulative impacts between Scarborough project activities are being addressed sequentially, meaning future Scarborough Environment Plans will assess temporal/spatial overlap with the Petroleum Activity Programs of previously submitted EP's.

In this EP, cumulative impact assessment has been carried out for:

- Routine acoustic emissions;
- Physical Presence (Unplanned) – Interaction with Marine Fauna

In this EP it was determined that cumulative impact from activities within the Petroleum Activities Program, as well as between the Petroleum Activities Program and D&C activities, was not credible for light emissions and vessel discharges.

Other facilities located in proximity to the Operational Area were identified within Section 4.9.6. While there may be spatial overlap with a number of pipelines and cables, activities cannot occur concurrently and therefore, no cumulative risks or impacts will credibly occur.

During EP consultation, Chevron advised Woodside of its intent to carry out a 4D Marine Seismic Survey (4D MSS) subject to approvals, in the vicinity of the Wheatstone facility. Timing of the survey is currently planned for Q1 2024 and may occur at the same time as Trunkline installation as the PV moves through the Montebello MUZ and lays westward adjacent to the Wheatstone infrastructure. Due to underwater noise propagation from the MSS, there is potential for cumulative noise impact, and this has been assessed in Section 6.7.6.

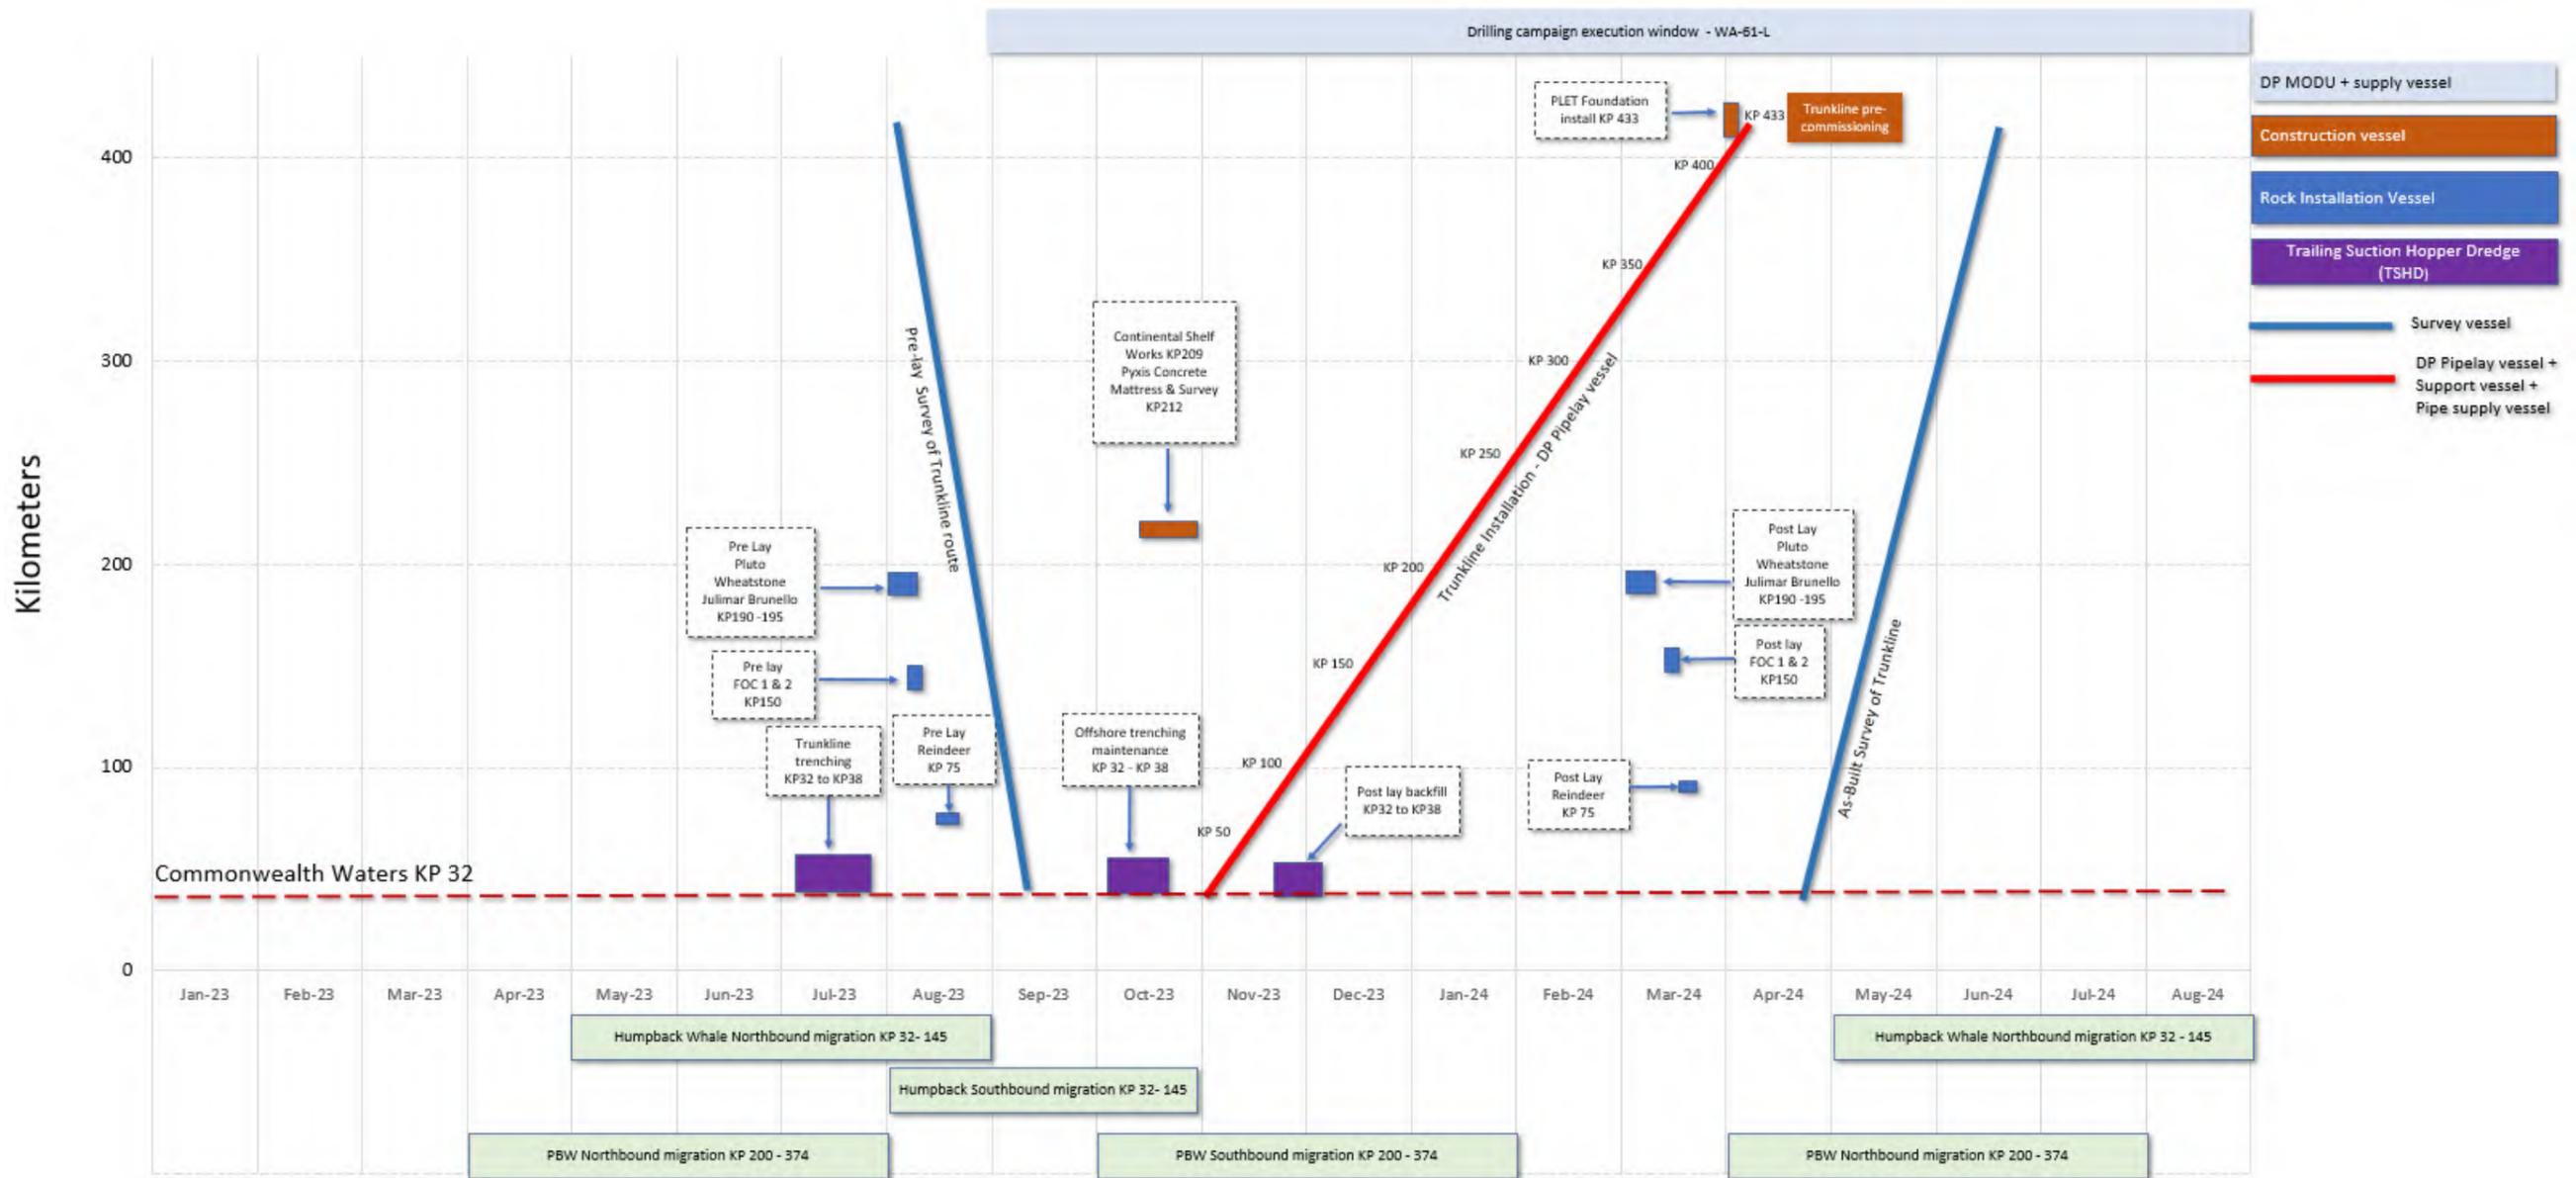

Figure 6-1: Scarborough SI & TI Activities indicative timing and locations along the Trunkline route

Schedule may be subject to future change due to vessel availability, weather, operational constraints and project sequencing.

Note 1 – KPs referenced inside cetacean migration boxes relate to migration BIA

Note 2 – Diagram is for illustrative purposes – to show spatial and temporal separation between activities, resulting in limited concurrent / cumulative impact potential. Activities will not start until EP is accepted and hence earliest commencement date shown on here will move pending EP acceptance.

Table 6-1: Concurrent operations, including both activities within this EP Petroleum Activities Program and the Scarborough D&C activities

Concurrent Activities	Approx. Timing & Location	Vessels	Cumulative impact not credible	Cumulative impact potential
Pre-lay survey & Drilling & Completions*	Approx. Sep 2023 ~ 4 days** PLET ~KP 433	Survey vessel DP MODU + supply vessel	Light – not credible as no sensitive receptors present (Section 6.7.4) Vessel strike – not credible due to limited presence of cetaceans and low vessel speeds (Section 6.8.7)	Noise – see assessment in Section 6.7.6
PLET foundation installation & Trunkline Installation & Drilling and Completions*	April 2024 – 2weeks PLET ~KP 433	Construction vessel DP Pipelay Vessel + pipe supply vessel + support vessel DP MODU + supply vessel	Light – not credible as no sensitive receptors present (Section 6.7.4) Vessel strike – not credible due to limited presence of cetaceans and low vessel speeds (Section 6.8.7)	Noise – see assessment in Section 6.7.6
Pre-commissioning & Drilling and Completions*	April / May 2024 – 1 – 3 months depending on pre-commissioning methodology dry vs. wet PLET ~KP 433	Construction vessel DP MODU + supply vessel	Light – not credible as no sensitive receptors present (Section 6.7.4) Vessel strike – not credible due to limited presence of cetaceans and low vessel speeds (Section 6.8.7)	Noise – see assessment in Section 6.7.6
Post-lay survey & Drilling and Completions*	Approx. June 2024 ~ 4 days** PLET ~KP 433	Survey vessel DP MODU + supply vessel	Light – not credible as no sensitive receptors present (Section 6.7.4) Vessel strike – not credible due to limited presence of cetaceans and low vessel speeds (Section 6.8.7)	Noise – see assessment in Section 6.7.6

*Drilling & Completions activities covered under the Scarborough Drilling and Completions Environment Plan. A x-mas tree installation vessel may also be present during the D&C program (if x-mas trees are not installed from the MODU). However, as the vessel and MODU cannot be over the same well at the same time, the worst case scenario is representative.

** Duration of concurrent activities overlap only, not indicative of timing of the whole activity

6.3 Environmental Performance Outcomes, Standards and Measurement Criteria

Regulation 13(7) of the Environment Regulations requires that an EP includes Environmental Performance Outcomes (EPOs), Environmental Performance Standards (EPSs) and Measurement Criteria (MC) that address legislative and other controls to manage the environmental risks of the activity to ALARP and acceptable levels.

The EPOs, EPSs and MC specified are consistent with legislative requirements and Woodside's standards and procedures. They have been developed based on the Codes and Standards, Good Industry Practices and Professional Judgement outlined in Section 2.2.3 and Section 2.2.4 as part of the acceptability and ALARP justification process.

During consultation, a summary of the controls adopted to manage the impacts and risks from the activity is included in the Consultation Information Sheet (Appendix F, 1.1) which is provided directly to relevant persons and available on the Woodside website.

In addition, during face-to-face consultation with Traditional Custodians, the particular controls adopted to manage interests raised are typically discussed by appropriate SMEs at the meeting to seek feedback. These controls may also be jointly adopted to protect the ecological value of a receptor. If additional controls are considered, to manage the risk to identified cultural values, these are discussed with the relevant persons who have raised the value.

Controls which have been adopted to manage the risk to a cultural value identified from literature or which are adaptive in nature may not have not been routinely tested during consultation with traditional custodians, unless the values has been identified by the relevant person themselves. It is not considered appropriate to broadly canvass Traditional Custodian relevant persons to validate cultural values identified from literature (not raised by the relevant person themselves) or associated controls. Instead, Woodside's in-house heritage and First Nations experts have been involved in developing and screening such controls. The EPOs, EPSs and MC are presented throughout this section and in Appendix D (Oil Spill Preparedness and Response). A breach of these EPOs or standards constitutes a 'Recordable Incident' under the Environment Regulations (refer to Section 7.17.4).

The Scarborough OPP identified the impacts and risks associated with the proposed development and defined suitable high-level Environmental Performance Outcomes. The Scarborough OPP EPOs have been cascaded to the relevant project activities under this EP and the relationship between OPP EPOs and those developed in this EP is also summarized in Table 6-2.

For the physical and biological receptors within the EMBA, Woodside has set EPOs that are consistent with the Matters of National Environmental Significance – Significant impact guidelines 1.1 (Commonwealth of Australia, 2013). For social receptors, including fishing and other commercial activities, the EPOs that have been set reflect the requirements in the OPGGS Act Section 280(2), in that the activities undertaken as a part of the development of Scarborough should not interfere with other marine users, to a greater extent than is necessary for the exercise of right conferred by the titles granted.

The EPOs for all environmental impacts/risks are identified and summarised in Table 6-2.

Table 6-2: Comparison of EP EPOs to the relevant OPP EPOs

Aspect	EPOs in this EP	Relevant EPOs from the Scarborough OPP	Comparison
Planned Activities			
Section 6.7.1 Physical Presence – Interactions with Other Marine Users	EPO 1 Undertake the Petroleum Activities Program in a manner that will not have a substantial adverse effect on the sustainability of commercial fishing.	EPO 5.1	The EPOs adopted in the EP for the interference with other users are consistent with the EPOs in the Scarborough OPP.
	EPO 2 Undertake the Petroleum Activities Program in a manner that does not interfere with other marine users to a greater extent than is necessary for the exercise of right conferred by the titles granted.	EPO 5.2	
Section 6.7.2 Physical Presence – Seabed Disturbance (Dredging, Spoil Disposal and Backfill)	EPO 3 Undertake the Petroleum Activities Program in a manner that does not result in a substantial change in water quality which may adversely impact on biodiversity, ecological integrity, social amenity or human health.	EPO 6.1; EPO 7.1 ; EPO 8.1; EPO 9.1; EPO 10.1; EPO12.1; EPO 13.1; EPO 14.1; EPO 15.2	The EPOs adopted in the EP for seabed disturbance are consistent with the EPOs in the Scarborough OPP.
	EPO 4 Undertake activities within the borrow ground to not harm or cause destruction to the sea floor habitats (including significant areas of sponge habitat) of the Dampier AMP Habitat Protection Zone.	EPO 6.2	
	EPO 5 Undertake the Petroleum Activities Program in a manner that ensures no displacement of marine turtles from habitat critical during nesting and internesting periods and marine turtles' biologically important behaviour can continue in biologically important areas.	EPO 1.5; EPO 6.6. <i>(updated to align with Recovery Plan)</i>	
	EPO 6 Undertake the Petroleum Activities Program in a manner that will not modify, destroy, fragment, isolate or disturb an important or substantial area of habitat such that an adverse impact on marine ecosystem functioning or integrity results.	EPO 1.1; EPO 4.1; EPO 6.4; EPO 6.8; EPO 11.5, EPO 12.4; EPO13.4; EPO 15.6; EPO 16.2; EPO 17.2; EPO 18.2.

6.5 Potential Environment Risks Not Included Within the Scope of this Environment Plan

The ENVID identified environmental risks that were assessed as not being applicable within or outside the Operational Area as a result of the Petroleum Activities Program and, therefore, were determined to not form part of this EP. These are described in the next sections for information only.

6.5.1 Shallow/Near-shore Activities

The Petroleum Activities Program is located in water depths greater than 30 m and more than 5 km from nearest landfall (Dampier Archipelago). Consequently, risks associated with shallow/near-shore activities and risks of grounding were assessed as not credible.

6.5.2 Loss of Containment from Existing or Third Party Subsea Infrastructure

As described in Section 4.9.6, the Trunkline Project Area intersects several existing oil and gas pipelines, over which crossings will be installed, and the Trunkline subsequently laid (Table 3-8). A subsea loss of containment from a rupture of one of these pipelines within the Operational Area could occur in the event of a dropped object (i.e. pipe) during Trunkline installation, including accidental drop/loss of the catenary. While credible, the risk has been eliminated through the adoption of lifting restrictions, detailed in the controls of Section 6.8.6. Rupture of existing pipelines from dropped objects (including rock) during rock berm installation has been deemed not credible due to design characteristics such as rock sizing. Equally there is no credible risk of loss of containment during other vessel interactions with existing pipelines, such as survey activities due to the size of equipment being used (ROV) and nature of the activity.

Worst-case credible hydrocarbon release scenarios have been defined in relevant EPs including:

- Start-Up and Operations EP for the Wheatstone Project
- Reindeer Wellhead Platform and Offshore Pipeline Operations EP
- Julimar Operations EP
- Pluto Facility Operations EP

These EPs include subsea loss of containment resulting from a rupture of the pipeline/flowline where relevant. The existing EPs provide a description and assessment of impacts and risks as well as management controls and response capabilities for a pipeline/flowline rupture.

Commercial and technical agreements covering crossing design and construction are being developed with the relevant third parties, and third party asset representatives are involved in the Woodside process safety framework. The representatives help to identify risks and controls relevant for the Petroleum Activities Program, and change manage existing asset risk profiles accordingly.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

While it is credible for activities within the Petroleum Activities Program to cause damage to third party infrastructure, at the point of environmental consequence occurring the event falls in the scope of the relevant third party Environment Plan described above. Additional controls for operating the project vessels are provided throughout Sections 6.7 and 6.8 of this EP. In particular, controls are included for the prevention of dropped objects (Section 6.8.6).

6.6 Indirect Impacts

For the proposed Scarborough Seabed Intervention and Trunkline Installation activity, the potential 'indirect' environmental impacts and risks evaluated are those associated with mobilisation/demobilisation of project vessels to the Operational Area, which have been considered in the environmental impact assessment in Section 6.7 and 6.8.

Due to the nature and scale of these potential indirect environmental impacts and risks (such as fuel usage, interaction with other marine users and usual vessel discharges), and the regulatory frameworks and applicable maritime regulations in place to manage them, Woodside considers the potential impacts and risks from mobilisation and demobilisation of the project vessels to be inherently ALARP in its current state. Therefore, Woodside considers that standard vessel operations are appropriate to manage the potential impacts and risks from mobilisation and demobilisation of project vessels to a level that is acceptable. The extraction of Scarborough gas for onshore processing is not included in this Petroleum Activities Program. Subsequent and future petroleum activities must first be authorised under the OPGGS(E)R and implemented before Scarborough gas is able to be extracted for onshore processing. Therefore any indirect impacts and risks arising from the onshore processing of Scarborough gas are not considered indirect impacts/risks of this Petroleum Activities Program, but will be evaluated in future Scarborough EPs as appropriate. Section 1.9.1.1 outlines the list of broader Scarborough Development activities, which will be addressed in EPs submitted to NOPSEMA for assessment.

Table 6-3: Environmental Risk analysis and summary

Aspect	EP Section	Risk Rating				Acceptability
		Impact/Consequence	Potential Impact/Consequence Level	Likelihood	Current Risk Rating	
Planned Activities (Routine and Non-routine)						
Physical Presence – Interaction with other marine users	6.7.1	E	Environment – Slight, short-term impact (less than one year) on species, habitat (but not affecting ecosystems function), physical or biological attributes.	-	-	Broadly Acceptable Has been shown to meet requirements listed in Section 2.3.5
Physical Presence – Seabed Disturbance (Dredging, Spoil Disposal and Backfill)	6.7.2	D	Environment – Minor, short-term impact (1–2 years) on species, habitat (but not affecting ecosystem function), physical or biological attribute.	-	-	Broadly Acceptable Has been shown to meet requirements listed in Section 2.3.5
Physical Presence – Seabed Disturbance (Intervention and Trunkline Installation)	6.7.3	D	Environment – Minor, short-term impact (1–2 years) on species, habitat (but not affecting ecosystem function), physical or biological attribute.	-	-	Broadly Acceptable Has been shown to meet requirements listed in Section 2.3.5
Routine Light Emissions from Project Vessels	6.7.4	E	Environment – Slight, short-term impact (less than one year) on species, habitat (but not affecting ecosystems function), physical or biological attributes.	-	-	Broadly Acceptable Has been shown to meet requirements listed in Section 2.3.5
Routine Atmospheric and Greenhouse Gas Emissions	6.7.5	F	Environment – No lasting effect (less than one month); localised impact not significant to environmental receptors.	-	-	Broadly Acceptable Has been shown to meet requirements listed in Section 2.3.5
Routine Acoustic Emissions	6.7.6	E	Environment – Slight, short-term impact (less than one year) on species, habitat (but not affecting ecosystems function), physical or biological attributes.	-	-	Broadly Acceptable Has been shown to meet requirements listed in Section 2.3.5
Routine and Non-Routine Discharges: Vessels and Seabed Intervention	6.7.7	E	Environment – Slight, short-term impact (less than one year) on species, habitat (but not affecting ecosystems function), physical or biological attributes.	-	-	Broadly Acceptable Has been shown to meet requirements listed in Section 2.3.5

Aspect	EP Section	Risk Rating				Acceptability
		Impact/ Consequence	Potential Impact/Consequence Level	Likelihood	Current Risk Rating	
Physical Presence (Unplanned): Accidental Introduction and Establishment of Invasive Marine Species	6.8.8	D	Minor, short-term impact (1–2 years) on species, habitat (but not affecting ecosystem function), physical or biological attribute.	0	L	Broadly Acceptable Has been shown to meet requirements listed in Section 2.3.5

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

anchor pattern for safety purposes. There is the potential for the SWLB anchor pattern exclusion zone to temporarily displace third party vessels. SWLB will implement an exclusion zone covering the mooring spread (nominally 1600 m) - this will be confirmed during Safety Case development and will be communicated to stakeholders during start of activity notifications.

Helicopter Operations

Helicopters will be used to transport personnel during the Petroleum Activities Program. Transport will occur on a regular basis, potentially with multiple flights per day (for larger vessels such as the PV) up to six days a week.

Detailed Impact Assessment

Assessment of Potential Impacts

Commonwealth and State-managed Fisheries

Five Commonwealth-managed fisheries and fourteen State-managed fisheries overlap with the Operational Area (refer to Section 4.9.2). Potential impacts to commercial fishers depends on the use of the area by fishers, and the temporal and spatial extent of the presence of vessels. Potential impacts to commercial fisheries include loss of commercial catch due to displacement from fishing grounds.

During the Petroleum Activities Program the presence of vessels will present a surface hazard to fishing vessels. Given the distance offshore, the majority of the Operational Area does not represent an area of high commercial fishing activity, however fishing activity is higher in nearshore waters, including KP 32 to KP 50. Activities in nearshore waters will take place over a short period, with pre-lay trenching and spoil disposal expected to take approximately two months and pipelay approximately six months along the full trunkline route (refer to Table 3-4). During this period, vessels will be continually moving and operating within a small spatial footprint. The presence of vessels and exclusion zones around the anchor spread for the SWLB (if required) will be limited to specific areas of the Operational Area at any one time. Therefore, fishing vessels will not be excluded from the entire Operational Area for the total duration of the Petroleum Activities Program. Furthermore, the Operational Area comprises a relatively small area when compared to the extent of the individual fishery boundaries. As such, displacement of commercial fisheries due to activities in the Operational Area are not expected to impact commercial fishing activities or the economic viability of the fisheries.

Considering the temporary and localised displacement potential for commercial fisheries due to the Petroleum Activities Program in the Operational Area, significant impacts to fishing activities are not expected. Any displacement of fishing activities will be temporary and have no lasting effect.

Tourism and Recreation

Tourism and recreation within the Operational Area is expected to be limited by the distance offshore and water depth. Some tourism may occur in the nearshore waters of the Trunkline Project Area, particularly in proximity to the Montebello Islands (refer to Section 4.9.4). However, impacts are expected to be limited by the short duration of the Petroleum Activities Program at this location, and the distance from these islands. Stakeholder consultation did not identify any key recreational fishing activity within the Operational Area. Potential impacts to tourism and recreational activities would likely be a minor interference (i.e. navigational hazard) and temporary, localised displacement/avoidance.

Shipping

Impact to commercial shipping is limited to the temporary presence of vessels throughout the Petroleum Activities Program. It is noted that a number of AMSA marine fairways intersect with the Operational Area (refer to Section 4.9.5). Dredging, material disposal and backfill activities, particularly in the shallower waters (KP 32 to KP 50 of the Operational Area) closer to the Dampier Archipelago and Pilbara Port Authority Management Area may cause temporary disruption to commercial shipping vessels. Interactions can be managed using well established maritime practices and, therefore, project activities are not expected to significantly disrupt shipping movements or port operations. Potential impacts to commercial shipping vessels are expected to include short-term displacement of vessels as they make slight course alterations to avoid the project vessels, which may result in minor delays or increased fuel use due to them having to take a less direct route. The presence of vessels and exclusion zones around them, including around the anchor spread for the SWLB (if required), will be limited to specific areas of the Operational Area at any one time, therefore resulting in a minor interference (i.e., navigational hazard) and localised displacement/avoidance by shipping.

Industry

A number of oil and gas facilities are located in proximity to the Operational Area, including a number of existing pipelines and fibre optic cables which intersect the Trunkline Project Area, requiring installation crossing supports (refer to Section 3.9.6). Rock berms and mattresses installed over existing infrastructure will be placed in a controlled manner, with positioning guidance from an ROV. The trunkline touchdown point will be continually monitored during installation over third party asset crossings to ensure correct instalment and no damage to infrastructure. Activities associated with the physical presence of vessels may result in localised, short-term interference to industry vessels requiring minor course alteration or readjustment in asset management while the Petroleum Activities Program is active in the area. However, impacts are not expected to have lasting effect.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

During EP consultation, Chevron advised Woodside of its intent to carry out a 4D Marine Seismic Survey (4D MSS) subject to approvals, in the vicinity of the Wheatstone facility. Timing of the survey is currently planned for Q1 2024 and may occur for up to two weeks at the same time as Trunkline installation as the PV moves through the Montebello MUZ and lays westward adjacent to the Wheatstone infrastructure. Any potential interaction will be managed through the SIMOPs process.

Defence

Defence activities in the vicinity of the Operational Area may include Naval vessel traffic and Air Force training exercises associated with the Learmonth Air Force Base (refer to Section 4.9.7). The Trunkline passes through a defence live firing range which is a Restricted Fly Zone. However, these activities are not expected to be a consistent presence in the area. Defence stakeholders were notified and feedback addressed as per Section 5. Any potential interaction is expected to be minimal and not significantly different from interaction with other facilities within the northwest region.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity Level	Magnitude	Impact Significance Level
Commonwealth-managed Fisheries	Changes to the function interests or activities of others	High value marine user	No Lasting Effect	Slight (E)
State-managed fisheries		High value marine user	No Lasting Effect	Slight (E)
Tourism and Recreation		High value marine user	No Lasting Effect	Slight (E)
Commercial shipping		High value marine user	No Lasting Effect	Slight (E)
Industry		Medium value marine user	No Lasting Effect	Negligible (F)
Defence		High value marine user	No Lasting Effect	Slight (E)

Overall Impact Significance Level: The overall impact significance level for interaction with other marine users is E based on no lasting effect to the high value receptors. The impact significance levels for individual receptors are consistent with the levels rated in the OPP, noting that defence, tourism and recreation were not identified receptors for this risk in the Scarborough OPP.

Demonstration of ALARP

No additional controls identified.				
<p>ALARP Statement:</p> <p>On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e., Decision Type A; Section 2.3.3), Woodside considers the adopted controls appropriate to manage the impacts of the physical presence of the Petroleum Activities Program on other users.</p> <p>As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.</p>				

Demonstration of Acceptability
Acceptability Criteria and Assessment
<p>The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5):</p> <ul style="list-style-type: none"> • Overall impact significance levels for individual receptors are consistent with the levels rated in the OPP. • EPOs and controls in the Scarborough OPP that are relevant to the interaction with other users have been adopted. • There are no changes to internal/external context specific to this risk from the Scarborough OPP, including issues raised during stakeholder consultation.
<p>Acceptability Statement:</p> <p>The impact assessment has determined that, given the adopted controls, the Petroleum Activities Program is unlikely to result in an impact significance level greater than Slight.</p> <p>The adopted controls are considered consistent with industry good practice and professional judgement and meet the requirements and expectations of Australian Marine Orders, AMSA, DPIRD, and AHO identified during impact assessment and stakeholder consultation. Further opportunities to reduce the impacts have been investigated above.</p> <p>The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts from the physical presence of the Petroleum Activities Program to a level that is broadly acceptable.</p>

Description of Source of Impact/Risk														
<p>This section assesses potential impacts from seabed disturbance resulting from Trunkline trenching and spoil disposal, offshore borrow ground dredging and Trunkline backfill activities. Seabed disturbance from trunkline installation and general seabed intervention activities are assessed in Section 6.7.3.</p> <p>Trunkline trenching and spoil disposal</p> <p>It is anticipated that trunkline stabilisation and hence trenching and backfill activities will be required in water depths shallower than 40 m, which corresponds to a location about 50 km offshore. Trunkline trenching activities will occur within the Trunkline Project Area (Section 3.9.3) and may result in seabed disturbance between the State Waters boundary (approximately KP 32) to a maximum of KP50 (including Spoil Ground 5A). Approximately 18 km in length and on average 30 m wide. The distance that trenching is required to extend into Commonwealth waters is being further refined during detailed engineering, so actual trenching and backfill activities may cover a smaller area.</p> <p>Pre-lay trenching works involves dredging a trench about 2 to 3.5 m deep within the indicative trunkline disturbance corridor (~30 m width). A seabed disturbance area of about 0.54 km² is expected.</p> <p>Trenched material from Commonwealth waters may be disposed into existing Spoil Ground 5A, which lies within the Trunkline Project Area and is approximately 300 m wide and runs for about 18 km between the State waters boundary and KP 50. A total volume of around 0.8 Mm³ of trenched material may be disposed of within Spoil Ground 5A.</p> <p>Through the placement of sediment within Spoil Ground 5A, it is expected an area of around 1.6 km² of seabed disturbance may occur (with maximum allowable disturbance area of 5.1 km² based on the entire spoil ground being disturbed, which is not anticipated). Note Spoil Ground 5A has been used previously. In this activity, sediment will be released from the hopper doors on the bottom of the TSHD where it will rapidly descend and deposit on the seabed within the designated disposal area.</p>

Offshore borrow ground dredging and Trunkline backfill

After the installation of the trunkline in the trench, backfilling with dredged material from the Offshore Borrow Ground will be required to help stabilise the trunkline. Approximately 2 Mm³ of backfill material will be sourced from the Offshore Borrow Ground, within Commonwealth waters. (Section 3.9.4). Approximately 0.9 Mm³ (in the case of backfill from KP 32 to KP 50) of sandy sediments with a low proportion of fines will be required to help stabilise the trunkline in Commonwealth waters, with the remainder potentially being used in State waters for the same purpose. Backfill material will be dredged and placed using a TSHD.

When backfilling the trunkline some trench overflow may occur due to the natural angle of repose of the material, as well as influencing hydrodynamic factors such as currents. The indicative width of seabed disturbance within the Trunkline Project Area is 30 m (i.e., the trunkline disturbance corridor), however for sand backfilling it is expected sediments will settle further afield due to hydrographic conditions in some locations.

Dredging within the offshore borrow ground is expected to result in a seabed disturbance area of around 4 km² (with maximum allowable disturbance area of 17 km² based on the entire borrow ground being disturbed, which is not anticipated). To avoid accidental incursion of seabed disturbance into the Dampier AMP, which lies adjacent to the proposed Offshore Borrow Ground, a 250 m buffer zone will be applied.

Contingency Activities

Secondary dredging of the pre-lay trench via the TSHD may be required if the trench silts up prior to pipelay installation (Section 3.13.10). Any additional material removed from the trench would be placed in Spoil Ground 5A as described above.

Seabed Disturbance Summary

Table 6-4 provides details on the expected and maximum total seabed disturbance from trenching and spoil disposal and borrow ground dredging and backfill activities. All disturbance will occur within the disturbance footprint as detailed within Section 7.1.6.1 of the Scarborough OPP (SA0006AF0000002, Rev 5).

Table 6-4: Dredging (trenching and borrow ground), spoil disposal and backfill seabed disturbance summary

Activity	Description	Expected disturbance area (km ²)	Maximum allowable disturbance area (km ²)
Trunkline trenching, spoil disposal and backfill	Trunkline trenching and backfill ¹	0.24	0.54
	Spoil Ground 5A material disposal ²	1.6	5.1
Offshore borrow ground dredging	Dredging within offshore borrow ground to source material for backfill	4	17

Note 1: Expected disturbance assumes KP32 to KP40, although impact assessment and maximum extent is to KP50

Note 2: Disturbance located within previously disturbed ground

Detailed Impact Assessment

Assessment of Potential Impacts

Seabed disturbance has the potential to result in the following impact(s):

- a change in habitat
- a change in water and sediment quality

Which may have the following further impacts

- injury and/or mortality to fauna

These are described in full in Section 7.1.6 of the Scarborough OPP (SA0006AF0000002, Rev 5), with no additional impacts identified for this EP. Where activities are consistent with those described in the Scarborough OPP, this section provides a summary of the assessment outcomes in the context of the Petroleum Activities Program covered by this EP. Where additional definition in relation to risks and impacts are available, this section provides additional detail as part of the impact assessment.

Sediment dispersion modelling approach

Sediment dispersion modelling was undertaken to assess the potential impacts to water quality and benthic communities from trenching and spoil disposal, and borrow ground dredging and backfill activities occurring in Commonwealth waters as part of the overall Scarborough project (which includes State and Commonwealth waters activities) (RPS 2022; Appendix I).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Sediment dispersion modelling has been revised since the acceptance of the Scarborough OPP (RPS 2022) to account for further Project definition realised during front end engineering and design, including additional geotechnical results. The revised modelling also provided an opportunity to further refine the source term assumptions and approach with the modelling consultant, RPS, to incorporate further learning from the WAMSI dredging science node, where applicable. To support the revised modelling a two-stage peer review was completed, with Stage 1 being a review of the appropriateness of the model inputs and process for the revised Scarborough dredge dispersion modelling study, and Stage 2 a review of the outcomes of the modelling and in particular whether the interpretation and conclusions were appropriate, with due consideration to dredging science and guidance.

Model outputs were interrogated by a series of water quality thresholds to predict the extent of impacts in a series of zones as recommended by Technical Guidance Environmental Impact Assessment of Marine Dredging Proposals (EPA 2021). These zones included a Zone of Influence (ZoI), Zone of Moderate Impact (ZoMI) and Zone of High Impact (ZoHI) as described in Appendix I. As detailed in Section 4.1, the ZoI contributes to the extent of the EMBA for this EP and is defined as:

‘The area within which changes in water quality associated with dredge plumes are predicted and anticipated during the dredging operations, but where these changes would not result in a detectable impact on benthic biota. These areas can be large, but at any point in time the dredge plumes are likely to be restricted to a relatively small portion of the Zone of Influence. The outer boundary of the Zone of Influence bounds the composite of all of the predicted maximum extents of dredge plumes and represents the point beyond which dredge-generated plumes should not be discernible from background conditions at any stage during the dredging campaign’.

In recognition that different species may display different degrees of tolerance and susceptibility to the same level of sediment-related pressure, it is appropriate to generate different predictions for identified management zones for different groups of benthic organisms or community/habitat types. Three ecological zones have been defined based on the sensitivity of benthic receptors. The ecological zones are named as follows and shown in Figure 6-2 and Figure 6-3. Note only the Offshore Zone and Zone B are of relevance to the Commonwealth waters activities.

- Offshore – the trunkline area beyond KP25, and generally all areas north of a boundary line containing Rosemary Island, Legendre Island and Delambre Island. It is considered benthic communities will be sparse and made up largely of sponges and filter feeders without corals.
- Zone B – the trunkline area between KP8 and KP25, adjacent coral and macroalgae habitats within Mermaid Sound, and generally all coral, macroalgae and mixed community habitats between Dolphin Island and Bezout Island, including Madeleine Shoals.
- Zone A – the trunkline area between the shoreline and KP8, adjacent macroalgae and mangrove habitats within Mermaid Sound, and generally all mangrove, marsh and seagrass habitats between Nickol Bay and Point Samson. Water quality within Zone A is more turbid and coral communities comprise more sediment-tolerant or resilient species (Blakeway and Radford, 2005).

The OPP (Section 7.1.6) and modelling report (Appendix I) provides a description of the modelling thresholds as relevant to each ecological zone, including source literature and rationale. Results of the modelling as relevant to the Commonwealth activities are summarised below with details provided in Appendix I.

Sediment Dispersion Modelling Results Summary

Dredging of the trench and spoil disposal activities to be undertaken in Commonwealth waters (Figure 6-2) are predicted by the modelling to cause detectable changes in water quality from elevated suspended sediment concentrations (as represented by the ZoI), however these increases in suspended sediment are predicted to remain below the intensity-duration thresholds that may cause an impact to benthic biota (as represented by the lack of ZoMI in Commonwealth waters). This is based on the conservative application of coral thresholds in State waters (including Madeleine Shoals, north of Legendre Island) and sponge thresholds in the offshore zone (i.e., Dampier AMP), as the most sensitive receptors in each zone.

For Offshore Borrow Ground dredging and backfill activities (Figure 6-3) the majority of the sediment suspended by dredging is forecast to be dispersed in the offshore area between the borrow ground and Legendre Island, including incursion into the Dampier AMP. Detectable changes in water quality, as represented by the ZoI, are predicted to extend into the Habitat Protection Zone (IV) of the Dampier AMP, but are not forecasted to intersect with the National Park Zone (II). Elevated suspended sediments are predicted to remain below the intensity-duration thresholds that may cause an impact to benthic biota (as represented by the lack of ZoMI).

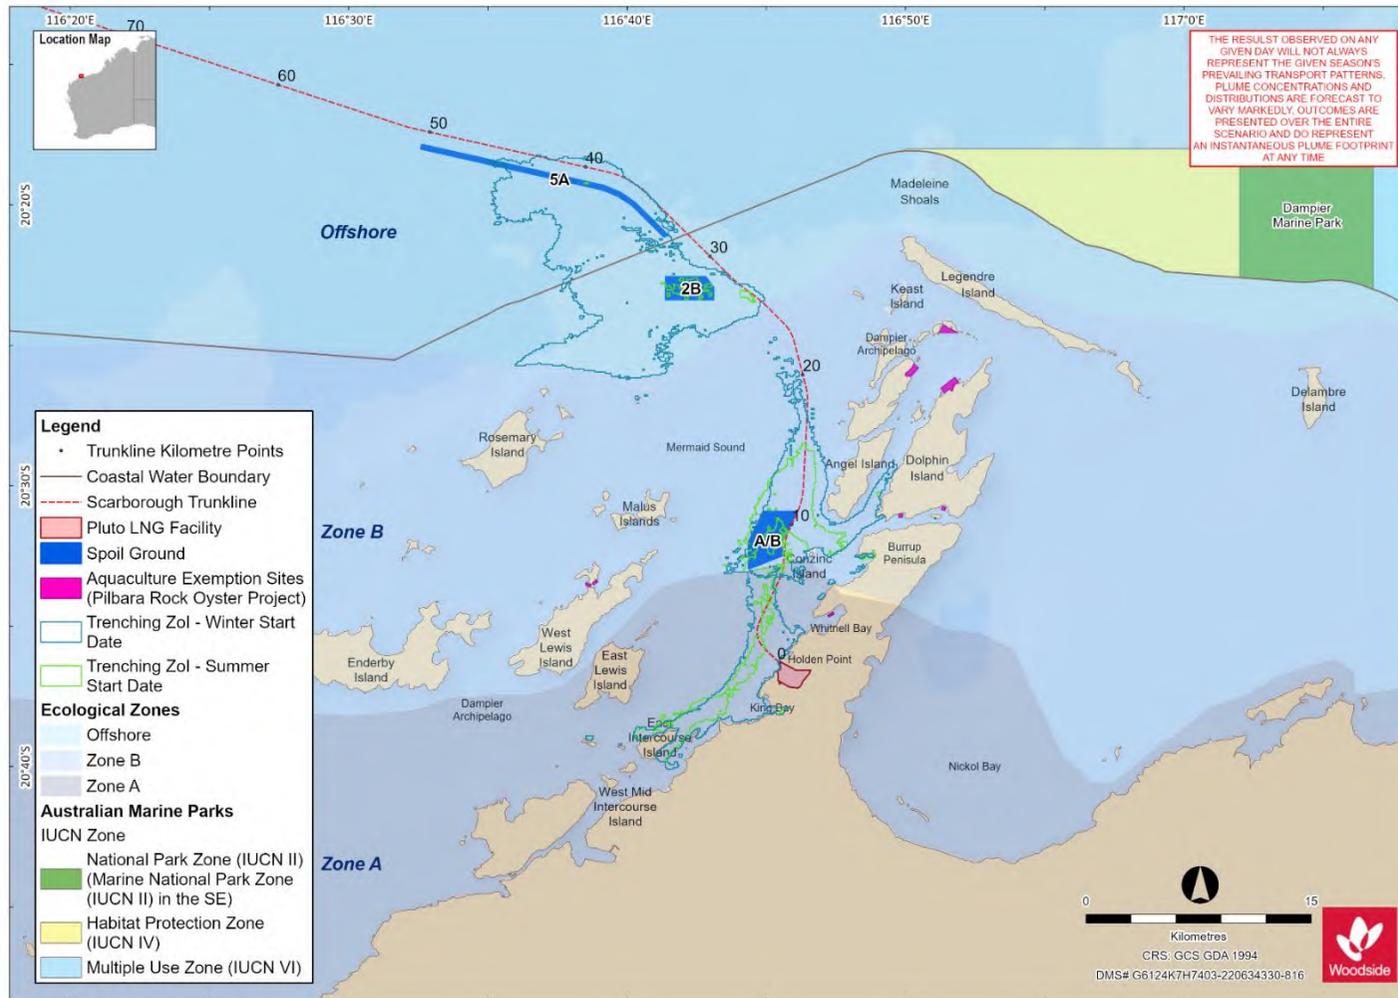

Figure 6-2: Predicted Zol for pipeline trenching and spoil disposal in Commonwealth and State waters (based on 24-hour rolling average). Zol does not represent an instantaneous plume footprint at any point in time, but rather a composite of all of the predicted maximum extents of dredge plumes

Water and Sediment Quality

Water quality change occurs when seabed sediments enter the water column (turbidity). Turbidity may occur during any activity which requires contact with, or occurs in close proximity to, the seabed. After a period, the suspended sediments settle and the turbidity in the water column returns to pre-disturbance levels. Impacts to sediment quality may occur from the redistribution of sediments, including changes to particle size distribution.

Potential impacts associated with changes in water quality is influenced by the local environment (sediment particle size distribution, natural turbidity) and nature of the activity, as described below:

- Elevated suspended sediment concentrations in the water column due to dredging, spoil disposal and backfill activities are expected to be spatially and temporally confined due to progression of the activities along the trunkline route. During trenching and borrow ground dredging by the trailing suction hopper dredge (TSHD), the primary plume at the draghead and from overflow is expected to settle within days, with the majority of particles suspended during the activity settling directly to the seabed, with some finer particle settling further afield. Monitoring results from the Pluto LNG Foundation project indicated a rapid decrease in turbidity beyond the immediate dredging footprint, with the median turbidity measured in proximity to the dredge rapidly dropping below the median and 80th percentile of natural turbidity at two reference sites located in areas unaffected by dredging (MScience, 2018).
- Similarly, spoil disposal activities within Commonwealth waters are expected to result in short term elevations during disposal, progressing along Spoil Ground 5A, parallel to the trunkline route. During disposal of trenched material from the TSHD, sediment would be released into the upper part of the water column, from where it would rapidly descend as a density current, with the heavy particles tending to entrain lighter particles, followed by a billowing of lighter components back into the water column after contact with the seabed. It is expected that these particles would likely settle back to seabed within hours/days, with some finer particles settling further afield.
- Peaks in suspended sediment associated with borrow ground dredging are expected to be of short duration given the intermittent nature of the activity, whereby the dredge fills the hopper (typically using overflow), sails to the trunkline section and places backfill material. Backfill operations involve the placement of coarser materials for trunkline stabilisation, and the fines component is therefore expected to be less than the dredging of the seabed. Given the lower fines component, suspended sediments are expected to settle more rapidly, limiting the temporal and spatial scale of any elevated turbidity.
- Note that the overflow funnel(s) of the TSHD will be fitted with "green valves". These valves restrict the entrainment of air into the overflow mixture thereby minimising fines dispersal and associated turbidity. Additionally, the overflow material sinks more rapidly due to density effects allowing better settlement of overflow material (refer to Demonstration of ALARP below).
- Water quality changes as a result of trenching, spoil disposal (within Spoil Ground 5A), borrow ground dredging and associated backfill activities in Commonwealth waters have been examined through sediment modelling (as summarised above), which reported:
- Detectable changes in water quality (as represented by the ZoI) from trenching and spoil disposal in Commonwealth waters is predicted to remain within the vicinity of the activity, with some minor incursion into State waters (Figure 6-2). These increases in suspended sediment concentrations are not predicted to exceed thresholds that may cause an impact to benthic biota (as represented by the lack of ZoMI) in Commonwealth waters.
- For offshore borrow ground dredging and backfill activities the majority of the sediment suspended by dredging is forecasted by the modelling to be dispersed in the offshore area between the borrow ground and Legendre Island in both seasons (Figure 6-3). Detectable changes in water quality, as represented by the ZoI, are predicted to extend into the Habitat Protection Zone (IV) of the Dampier AMP, but not the National Park Zone (II), as well as a small isolated pocket on the southern side of Hauy Island. As stated above, elevated suspended sediments are predicted to remain below the intensity-duration thresholds that may cause an impact to benthic biota (sponges) in the AMP and coral communities at Hauy Island (as represented by the lack of ZoMI). In the offshore ecological zone, the ZoI at the offshore borrow ground is only predicted when this activity is being undertaken during winter. This is largely a consequence of the lower thresholds applicable during the winter period, and hence the lower levels of dredge-excess suspended sediment concentrations (SSC) required to exceed the ZoI threshold.
- Following trenching and spoil disposal and borrow ground dredging and backfill activities, the sediment dispersion modelling predicts some secondary resuspension of sediment may occur in localised areas in Commonwealth waters due to tides, winds and waves for up to around four weeks at low concentrations.

Sediment sampling along the proposed pipeline route has demonstrated that sediments are suitable for unconfined ocean disposal with results indicating that all levels of potential contaminants of concern were below the NAGD (2009) screening levels. Therefore, sediments to be dredged (and suspended during operations) are considered to be uncontaminated and thus no toxicological impacts from the resuspension of contaminants are predicted.

Impacts from seabed disturbance on water and sediment quality will be slight. Receptor sensitivity of water and sediment quality is low (low value, open water), and therefore the Impact Significance Level of seabed disturbance on water and sediment quality is **Negligible (F)**.

Epifauna and Infauna

Seabed disturbance and potential impacts to epifauna and infauna may occur as a result of the mobilisation and/or displacement of sediments along the trunkline and during borrow ground dredging activities. Disturbance to the seabed can alter the physical seabed habitat conditions, resulting in epifauna and infauna community changes (Newell et al., 1998). Potential impacts include:

- Direct impacts, including physical removal and irreversible loss of benthic communities and habitat and temporary alteration of the existing hydrodynamic regime within the direct footprint of activities.
- Indirect impacts caused by reduced water quality or increased sedimentation, including indirect effects on filter feeder-sponge habitat through reduced light availability for photosynthesis of the sponges' symbionts and reduced filtering and feeding (Abdul Wahab et al., 2019).

The below discusses the potential epifauna and infauna impacts for individual activities:

- Dredging, spoil disposal and backfill activities will alter the seabed habitats over which the activities occur, resulting in epifauna and infauna community changes. Direct impacts from these activities may occur in areas described in Section 4.5. Noting following trunkline installation, sand from backfill operations may settle in a wider corridor beyond the 30 m average trunkline disturbance corridor, but is expected to settle in a thin layer beyond the immediate area of material distribution. The overall trunkline disturbance area allows for the distribution of some sediments to be wider than 30 m as in some areas it is significantly less than 30 m.
- Sediment dispersion modelling (RPS 2022) of trunkline trenching and spoil disposal (within Spoil Ground 5A), and borrow ground dredging and associated backfill activities in Commonwealth waters found detectable changes in water quality (as represented by the ZoI), however the increases in suspended sediment concentrations are not predicted to exceed thresholds that may cause an impact to benthic biota (as represented by the lack of ZoMI). Noting the ZoI does not represent an instantaneous plume footprint at any point in time, but rather a composite of all of the predicted maximum extents of dredge plumes.
- The habitats likely to be present along the trunkline between KP 32 and KP 50 (including Spoil Ground 5A) are detailed in Section 4.5. Epifaunal communities are classed as sparse and of low diversity in the vicinity of the proposed trunkline between KP 32 and KP 50. Both epifaunal and infaunal communities are considered representative of the area and are similar to those observed in other regional studies where seabed sediments consist of silty to coarse sands, typical of the North West Shelf (Keesing, 2019; Advisian, 2019b). Drop camera surveys completed in Spoil Ground 5A prior to its use for the Pluto LNG Foundation project showed that benthic communities and habitats were sparse, and current coverage is expected to be similar (Section 4.5.2). Spoil Ground 5A is a previously disturbed area, and as such, the use of this ground will not destroy, fragment or disturb significant epifaunal or infaunal communities. The proposed trunkline route has been selected to avoid sensitive habitats as far as practicable and utilises existing routes established as part of the Pluto LNG Foundation project. The trunkline route between KP 32 and KP 50 does not pass through any AMPs or KEFs.
- Borrow ground dredging will occur within the Offshore Borrow Ground with approximately 2 Mm3 expected to be sourced, over an area of about 17 km2 (of which about 4 km2 is expected to be disturbed). This area consists of bare substrate with large areas of seabed largely devoid of any epibenthic species (Section 4.5). Drop camera surveys (Advisian, 2019c) indicated anemones and crinoids occur at ~5% density, and were only observed at two of twenty nine sites surveyed. Direct impacts from dredging on the epifauna and infauna will therefore be limited due to low density cover. Beyond this direct disturbance area, modelling (RPS, 2022) has shown that the elevations in turbidity as a result of dredging operations adjacent to the Dampier AMP will remain below the intensity-duration thresholds predicted to cause an impact to benthic communities. Impacts to the values of the Dampier AMP are further assessed in the AMP section below.
- Epifauna and infauna along the trunkline, in the Borrow Ground and in the adjacent Dampier Marine Park may be foraging habitat to marine turtles. Any impacts to the value of the foraging grounds, including from changes to epifauna and infauna, and any subsequent impact to marine turtles, is further assessed in the Marine Turtle section below.

Given the habitats likely to be present along the trunkline KP 32 and KP 50 (as described above) and the lack of impacts predicted from elevated turbidity in the Dampier AMP, the magnitude of impacts from seabed disturbance on epifauna and infauna from trenching, spoil disposal and backfill operations is assessed to be minor. Receptor sensitivity of epifauna and infauna is low (low value, homogenous). The Impact Significance Level of seabed disturbance on epifauna and infauna has therefore been identified as **Slight (E)**.

Coral

Trenching and spoil disposal and borrow ground dredging and backfill activities have the potential to impact coral as a result of elevated concentrations of suspended sediment (turbidity), changes in light quality and quantity, and sedimentation (Jones et al. 2016). Elevated turbidity within the water column reduces light penetration and therefore the availability of light for photosynthesis (Erftemeijer et al. 2012). While, elevated sedimentation rates may also suppress coral growth and survival when energy expenditure is redirected to actively clear settled sediments from coral tissue (Erftemeijer et al. 2012; Jones et al. 2016).

Coral communities of the Dampier Archipelago predominantly occur as narrow linear features fringing the shorelines of islands and the Burrup Peninsula, typically between 2 m and 10 m mean lower low water (Blakeway and Radford, 2005;

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Jones, 2004). Within Commonwealth waters, geophysical surveys coupled with environmental data found that the trunkline route consists of carbonate sands with some finer components, which supports sparse filter feeder communities. Similarly, preliminary findings from the benthic habitat survey completed in the Borrow Ground Project Area and adjacent areas of the Dampier AMP found that benthic habitat within the Borrow Grounds Project Area and the adjacent area of the Dampier Marine Park Habitat Protection Zone (IV) consisted of sand with little to no biota throughout the area. As such no direct disturbance to coral communities from installation and seabed intervention activities is expected.

Modelling has been completed that considers impacts to benthic communities and habitats in Commonwealth and State waters, including coral habitats of the Dampier Archipelago and inshore of the proposed Borrow Ground (RPS 2022). Modelling has shown that trenching and spoil disposal and borrow ground dredging and backfill activities undertaken in Commonwealth waters are predicted to cause detectable changes in water quality from elevated suspended sediment concentrations (as represented by the Zol), that are predicted to extend into State waters. The Zol is only predicted to coincide with coral communities in an isolated pocket on the south side of Hauy Island, with no overlap predicted on the seaward slopes of outer islands such as Legendre Island and around Madeleine Shoals. Increases in suspended sediment levels are however predicted to remain below the intensity and duration thresholds at which impacts to benthic biota may occur. Modelling has also shown that SSC levels are predicted to be an order of magnitude below the SSC levels required to sustain a sedimentation rate close to that reported as having effects on benthos (Duckworth et al., 2017).

The effects of dredging-related pressures on coral fertilisation, larval development and settlement have also been assessed with reference to broadcast spawning species and coral spawning window/s of environmental sensitivity (CWES). Fertilization is sensitive to elevated suspended sediments whereby suspended sediments adhered to the mucous membrane of the egg-sperm bundles, reducing their ascent or preventing them from reaching the water surface (Negri et al. 2019). Ricardo et al., (2016; 2015) concluded that high SSCs can affect the ascent of egg-sperm bundle and egg-sperm encounter rates, and fertilization success at the surface. For colonies spawning from 15 m depth, coarse-silt SSCs of 35 mg L⁻¹ resulted in a 10% decrease in egg-sperm encounters, while from shallower (5 m deep), the EC10 occurred at an SSC of 106 mg L⁻¹ (Ricardo et al. 2017). As stated in Negri et al. (2019) and supported by sediment dispersion modelling, these SSCs and particle sizes typically occur close to the dredging activity and are commonly associated with upper-percentiles of sediment plumes from dredging or natural resuspension events. Given fertilization occurs within the first few hours of spawning (Ricardo et al. 2017) and the distance from borrow ground dredging activities to coral communities (Madeleine Shoals >3 km; Legendre Island > 6km), only a small number of coral larvae (if any depending on prevailing currents) may encounter elevated SSCs in close proximity to dredging activities in Commonwealth waters that may affect fertilization. Further, although the zone of influence extends to Hauy Island (in State waters) it is not predicted to reach SSCs that may affect fertilization in shallow waters.

For the pelagic stages of the larvae at the surface and in the water column, Ricardo et al (2017) concludes that embryogenesis and larval development were quite insensitive to elevated suspended sediment, with mucous secretion and cilia beating effectively used to protect coral embryos and larvae from elevated SSCs. Embryo survivorship and subsequent metamorphosis were not affected across the range of SSCs tested, in some assays as high as ~1000 mg L⁻¹ (Ricardo et al. 2017). Negri et al (2019) concludes that where coral spawning occurs at a distance from the dredging activities and developing embryos and larvae drift into a turbid plume of similar SSCs, there is comparatively little risk of negative effects on embryo and larval survivorship. As such although planktonic coral larvae may drift into the sediment plume generated by trenching and spoil disposal, and offshore borrow ground dredging in Commonwealth waters, embryo and larval survivorship is unlikely to be negatively affected.

In contrast, the settlement phase is at risk if the options for larval settlement are primarily on upper surfaces that are (or have recently been) coated in an elevated yet thin film of deposited sediments from a dredging plume (Negri et al. 2019). Larval settlement has found to be sensitive to deposited sediment, with very low levels of fine deposited sediment (i.e. <~5 mg cm² day) deterred settlement and caused a change in larval settlement preference to sediment (Negri et al 2019). Given the distance of trenching and spoil disposal, and borrow ground dredging and backfill activities in Commonwealth waters from coral communities, and that modelling only predicts a zone of influence to extend to isolated areas of coral communities (e.g. Hauy Island), these activities are not anticipated to result in increased sediment deposition in nearshore benthic habitats over that experienced naturally (i.e. spring tides, elevated metocean conditions etc.) and hence no impacts to coral settlement expected.

In summary, elevated suspended sediments from dredging activities in Commonwealth waters are not predicted (based on modelling) to interact with coral larvae (both pelagic and during settlement) at concentrations that may impact the various developmental stages. Given direct and indirect impacts to coral habitat are not predicted from seabed intervention activities in Commonwealth waters, the magnitude of impacts from seabed disturbance is assessed to be 'no lasting effect'. Receptor sensitivity of coral is high. The Impact Significance Level of seabed disturbance on coral has therefore been identified as **Slight (E)**.

Fish

Increased suspended sediments concentrations (SSC) associated with dredging, spoil disposal and backfill operations, as well as the installation of infrastructure may affect fishes ability to forage, hunt and avoid predators (Harvey et al., 2017). Elevated concentrations of suspended sediments may also cause physiological impacts such as gill impairment. An analysis of available literature by Harvey et al. (2017) suggests that impacts from very fine sediment range from

minimal (10 mg/l SSC¹⁷) to extreme (1000 mg/l SSC) (Harvey et al., 2017). Note the studies that made up the species sensitivity distribution from which this value was derived were based on exposure to very fine sediment (<4 µm) in a controlled environment, and exposure times ranging from 0.08 hours to 120 hours. While the Commonwealth activities are being undertaken in open ocean environment, with the sediments being predominantly sand (>75 µm) with minimal fines.

For dredging, spoil disposal and backfill activities undertaken in Commonwealth waters, modelling indicates that excess SSC is predicted to remain less than 10 mg/L, based on 95th percentile depth averaged results¹⁸ (Figure 5-2 and Figure 5-6 of Appendix I). Further, the trenching and backfill operations are expected to rapidly progress along the trunkline route ensuring increased suspended sediment levels are spatially and temporally confined. Similarly, spoil disposal activities within Commonwealth waters are expected to result in short term elevations during disposal, as they progress along Spoil Ground 5A, parallel to the trunkline route. While elevated SSC at the borrow ground during dredging will be intermittent given the nature of the activity (i.e., dredging then backfill).

Given potential impacts to fish are not predicted from seabed intervention activities in Commonwealth waters, the magnitude of impacts from seabed disturbance is assessed to be 'no lasting effect'. Receptor sensitivity of is high. The Impact Significance Level of seabed disturbance on fish has therefore been identified as Slight (E).

Marine Turtles

Five species of marine turtle may occur in the Operational Area: flatback, green, hawksbill, loggerhead and leatherback turtles. The Operational Area overlaps internesting habitat critical and BIAs (internesting buffer) for flatback, green and hawksbill turtles around the Dampier Archipelago and Montebello Islands (Section 4.6). Activities in proximity to these sensitive locations are limited to the trenching and backfill along the trunkline route (KP 32 to KP 50), dredging within the Offshore Borrow Ground Project Area and disposal of material in Spoil Ground 5A. There is no overlap with foraging BIAs for any turtle species.

The Recovery Plan for Marine Turtles in Australia (DoEE, 2017) identifies habitat modification from infrastructure/coastal development as a threat to the stocks of flatback, green, and hawksbill turtles in the North West Shelf and Pilbara region.

Flatback, green and hawksbill turtles have an omnivorous diet; with flatbacks feeding mainly on algae and a variety of invertebrates (molluscs, soft corals, sea cucumbers and jellyfish), hawksbills primarily targeting sponges but also consuming seagrass and invertebrates (shrimp, squid, anemones, sea cucumbers and soft corals), and green turtles eating seagrass, macroalgae and jellyfish. Marine turtle foraging habitat is widely represented in the region and any loss is expected to be negligible. Further to this, surveys of the trunkline route have not indicated the presence of any unique or limiting benthic foraging habitat for marine turtles within the trunkline corridor. While there are no designated foraging BIAs for marine turtles that overlap the Dampier Marine Park, foraging for marine turtles is an identified value of the Park. Recent benthic habitat surveys of an area of the Dampier AMP habitat protection zone adjacent to the Borrow Grounds Project Area (Advisian, 2019c) showed the seabed and benthic composition of the area surveyed was relatively uniform in structure and composition. Sediment dispersion modelling for the dredging of the Borrow Ground showed no exceedance of the ZoMI or ZoHI in the offshore ecological zone. A ZoI was defined which does extend into the boundary of the habitat protection zone of the Dampier Marine Park. However, it is noted that the ZoI is defined as an area within which changes in water quality associated with dredge plumes are predicted but where these changes would not result in a detectable impact on benthic biota including epifauna and infauna which may have foraging value of the adjacent habitat protection zone. As such impacts to epifauna and infauna are not likely to result in displacement of marine turtles from foraging areas in shallower waters of the Trunkline and Borrow Ground Project Areas.

Based on the key food sources of marine turtle species, and the low relative abundance of epifauna and infauna found in the Trunkline and Borrow Grounds project areas, these areas are unlikely to support foraging aggregations of marine turtles (Pendoley Environmental, 2020). Any impacts from seabed disturbance on epifaunal communities may result in some changes to, and/or loss of, foraging habitat for marine turtles, or displacement of individual turtles from areas utilised as foraging habitat. Internesting behaviours exhibited by flatback turtles extend further offshore compared to other marine turtle species in the NWMR. However, tracking data indicates that flatback turtles in the NWMR travel and forage in relatively shallow coastal waters less than 70 m deep (Chevron Australia Pty Ltd, 2015). The 60 km internesting buffer for flatback turtles in the Recovery Plan for Marine Turtles in Australia (DoEE, 2017) is based primarily on the movements of tagged internesting flatback turtles along the North West Shelf from a 2014 study, which found that flatback turtles may demonstrate internesting displacement distances up to 62 km from nesting beaches (Whitlock et al., 2014). However, these movements were confined to longshore movements in nearshore coastal waters or travel between island rookeries and the adjacent mainland (Whitlock et al., 2014). The flatback turtle internesting habitat along the North West Shelf has since been defined more precisely using satellite tracking of 47 turtles, combined with a range of environmental variables (Whitlock et al., 2016a). Suitable internesting habitats were identified as water depths of 0 – 16 m, within 5 – 10 km of the coastline. These were located close to a number of known flatback turtle rookeries within the region. Unsuitable internesting flatback habitats were identified as water depths of > 25 m depth and > 27 km from the coastline. The primary environmental variables that influenced flatback internesting movements were bathymetry, distance from coastline and sea surface temperature (Whitlock et al., 2016a).

Suitable internesting habitat for green turtles is also likely to be limited to relatively shallow waters within close proximity of the coastline. While information on internesting movements of green turtles in Western Australia is limited, tracking

¹⁷ The 10 mg/L is considered conservative as it is based on the lower confidence interval of the 90% species protection level.

¹⁸ The depth-averaged TSS concentration is the value calculated as an average over all modelled layers in the water column.

data has shown that during nesting periods, female green turtles typically inter-nest in shallow, nearshore waters between 0 and 10 m deep (Pendoley, 2005) and remain <5 km nesting beaches on Barrow Island, Varanus Island, and Rosemary Island (Pendoley, 2005) and within 10 km of nesting beaches on the Lacepede Islands (Waayers et al., 2011). Other international studies also suggest internesting grounds for green turtles are located close to nesting beaches, in 10–18 m of water (Stoneburner, 1982; Mortimer and Portier, 1989; Maylan, 1995; Tucker et al., 1995; Starbird and Hills, 1992). Hays et al. (2000) deployed time-depth recorders on green turtles that had nested on Ascension Island in the South Atlantic, to examine their diving behaviour during the subsequent internesting interval. Dive profiles indicated turtles remained at a fixed depth for an extended period, surfacing briefly, before diving to the same depth. The maximum depth routinely reached was between 18 to 20 m and > 20 m resting dives were extremely rare (Hays et al., 2000). Further published research by Ferreira et al., (2021), showed satellite tracked and modelled green turtle distribution and movement were well matched with the defined internesting BIAs/habitat critical to survival buffers, migration routes were predominately coastal with some green turtles remaining as residents, and foraging habitat not well defined and extensive in state coastal waters.

Female hawksbill turtles have been reported to remain within 10 km of their nesting beaches on Varanus Island, and within 1 km on Rosemary Island (Pendoley, 2005).

The shallowest point of the Trunkline Project Area occurs in waters adjacent to the Dampier Archipelago (approximately 30 m depth). In the Offshore Borrow Ground Project Area, water depths range between 30 to 40 m, and internesting green and hawksbill turtles are unlikely to utilise the habitats at these depths. Therefore, seabed disturbance within the Trunkline and Offshore Borrow Ground Project Areas is not expected to adversely impact on biologically important behaviours or biologically important habitat, including habitat critical to the survival of marine turtles. The Operational Area is not likely to represent important internesting habitat for flatback, green and hawksbill turtles, and any displacement of individuals from areas utilised as foraging habitat will not result in any significant impacts at a population level.

Impacts from seabed disturbance on marine turtles will be slight. Receptor sensitivity of marine turtles is high, and the Impact Significance Level of seabed disturbance on marine turtles is **Minor (D)**.

Australian Marine Parks

The offshore borrow ground dredging will occur adjacent to the Dampier AMP, with a 250 m buffer applied from the Marine Park boundary to avoid accidental incursion. The AMP provides protection for offshore shelf habitats adjacent to the Dampier Archipelago, and the area between Dampier and Port Hedland, and is a hotspot for sponge biodiversity. A 2017 survey of the park reported sponges to account for 20 – 50% of biota, including several rare and endemic species (Keesing et al., 2019). The North-west Marine Parks Network Management Plan (DNP, 2018a) also lists natural, heritage, cultural and socio-economic values of the AMP as described in Section 4.8. The park includes a Habitat Protection Zone which provides for the conservation of ecosystems, habitats and native species as a result of the high biodiversity and natural values.

Sediment dispersion modelling (RPS, 2022) for dredging in the Offshore Borrow Ground Project Area has indicated that detectable water quality changes (as represented by the ZoI) are not predicted within the National Park Zone (II) of the Dampier AMP. Furthermore, elevated suspended sediment concentrations within the Habitat Protection Zone (IV) of the Dampier AMP are predicted to remain below the intensity-duration thresholds that may cause an impact to benthic biota (as represented by the lack of ZoMI). Although there is a predicted temporary and intermittent detectable change in water quality that extends into the Habitat Protection Zone (IV) of the AMP these are expected to have minimal impacts on protected marine fauna, including humpbacks, shearwaters and marine turtles, limited to behavioural impacts which would be too small or meaningful to measure (NOAA, 2021). Therefore, given the nature of the change is temporary, impacts upon threatened, migratory, marine or cetacean species listed under the EPBC Act, is not expected. Therefore, no impacts are expected to the cultural values of the AMP as those are intrinsically linked to the natural values described above.

Therefore as there is no predicted impacts to the natural, cultural, heritage or socio-economic values of the AMP, dredging in the offshore borrow ground is therefore not inconsistent with the objectives of the North-west Marine Parks Network Management Plan (Table 6-39) or the zoning of the Dampier AMP (DNP, 2018a). Impacts from seabed disturbance on the Dampier AMP will be slight. Receptor sensitivity of AMPs is high (high value habitat). The Impact Significance Level of seabed disturbance on the Dampier AMP has been identified as **Minor (D)**.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity Level	Magnitude	Impact Significance Level / Risk Consequence
Water quality	Change in water quality	Low value	Slight	Negligible (F)
Sediment quality	Change in sediment quality	Low value	Slight	Negligible (F)
Epifauna and infauna	Change in habitat	Low value	Minor	Slight (E)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Coral	Change in habitat	High value	No lasting effect	Slight (E)
Fish	Injury/mortality to fauna	High value	No lasting effect	Slight (E)
Marine turtles	Change in habitat Injury/mortality to fauna	High value	Slight	Minor (D)
AMPs	Change in habitat Change in water quality	High value	Slight	Minor (D)

Overall Impact Significance Level/ Risk Consequence: The overall impact significance level for disturbance to benthic habitat from trenching and spoil disposal, and borrow ground dredging and backfill activities is D based on a minor impact to the most sensitive receptors (marine fauna and AMPs). The impact significance levels for individual receptors are consistent with the levels rated in the Scarborough OPP.

<p>For Borrow Ground dredging during coral spawning critical window/s of environmental sensitivity (CWES) TSHD to either:</p> <ul style="list-style-type: none"> operate with no overflow; OR where this is not possible suspend borrow ground dredging Coral spawning CWES dates related to the activity are defined below¹⁹: 28 November to 7 December 2023; (full moon 27 November) 30 March to 8 April (full moon 25 March 2024) 	<p>F: Yes although given predicted suspended sediment concentrations and location in Commonwealth waters the risk of potential impacts to coral larvae is considered to be low.</p> <p>CS: Significant cost and potential schedule impacts.</p>	Implementation of this control will reduce the risk of elevated suspended sediment on coral spawning in the vicinity of Madeleine Shoals.	Benefits outweigh cost/sacrifice.	Yes C 2.8
On vessel monitoring and assessment of dredge material by a maritime archaeologist and Traditional Custodians	<p>F: No. Human interaction with dredge material to be kept to a minimum for safety. Some vessels also have limited vessel capacity, particularly where on-vessel accommodation is required, which are already allocated to essential operational and safety crew.</p> <p>CS: Additional costs of engaging a maritime archaeologist and Traditional Custodians</p>	Due to sediment volumes, this method is considered unlikely to allow effective monitoring of dredge material.	Not assessed, control not feasible.	No
Unexpected finds of potential Underwater Cultural Heritage ²⁰ sites / features, including first nations UCH are managed in accordance	<p>F: Yes</p> <p>CS: Costs of implementation</p>	Allows management of new finds in accordance with legislative requirements	Benefits outweigh cost/sacrifice.	Yes C 2.10

¹⁹ Gilmour et al (2016) states that the primary period of spawning for the region is in autumn. Autumn coral spawning CWES are defined as the 10 day period, five to 15 days after the predicted full moon in March and/or April, which is based on studies that have found that the majority of broadcast spawning species in Mermaid Sound spawn during neap tides approximately one week after the full moon (Gilmour et al. 2016). Spring coral spawning CWES are defined as the 10 day period, one to 11 days after the predicted full moon in November, which is based on studies that have demonstrated that Porites lutea spawns during spring tides predominantly 3 days after the full moon (Stoddart et al. 2012; Baird et al. 2011).

²⁰ Underwater Cultural Heritage is defined as any trace of human existence that has a cultural, historical or archaeological character and is located under water, in accordance with the UCH Act.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
	contains too many fines and not enough coarse material to be acceptable for reuse as backfill. CS: Not assessed control not feasible.			
Onshore disposal of unsuitable backfill material	F: Yes. It is possible to dispose of unsuitable backfill material onshore. CS: Significant cost would be involved in transiting material (e.g. additional vessels, fuel use, resources etc.). Would require additional time and presents additional risks (e.g. vessels use / transiting). Material would have to be disposed of at an onshore location which would require significant infrastructure set up.	Would negate the requirement to dispose of unsuitable backfill material in Spoil Ground 5A. However little environmental benefit as Spoil Ground 5A has previously been used for material disposal (Pluto trunkline) and there would be little to no environmental benefit of disposing of the material onshore.	Cost/sacrifice outweighs the benefit gained.	No
Professional Judgement – Engineered Solution				
Overflow funnels on the TSHD fitted with 'green valves'	F: Yes. Overflow funnels can be fitted with green valves. CS: A moderate level of costs is expected to fit the green valves in comparison to the base case.	These valves restrict the entrainment of air into the overflow mixture thereby minimising fines dispersal and associated turbidity. Further, the overflow material sinks more rapidly due to density effects allowing better settlement of overflow material.	The additional cost is considered acceptable considering the associated environmental benefit.	Yes C 2.7
Use of a drag head skirt on the TSHD	F: Yes. It is possible to install a skirt on the drag head. CS: Additional cost is required to install a skirt on the drag head.	Installing a drag head skirt will reduce the turbidity within the water column when dredging material. However given the low sensitivity surrounding environment and low risk to water quality (see modelling), benefit is marginal and would not significantly further reduce the risk.	Cost/sacrifice outweighs the benefit gained.	No

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Spoil disposal to seabed via reverse pumping through TSHD drag head to seafloor	F: Yes. It is possible to reverse pump material to the seabed through the drag head. CS: Additional time is required to reverse pump. Given the volumes required to be disposed of in Spoil Ground 5A there is a significant cost.	Reverse pumping through the drag head may reduce the turbidity within the water column. However given the low sensitivity surrounding trench location environment and low risk to water quality (see modelling), benefit is marginal and would not significantly further reduce the risk.	Cost/sacrifice outweighs the benefit gained.	No
<p>ALARP Statement</p> <p>On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.3.3), Woodside considers the adopted controls appropriate to manage the impacts of seabed disturbance from activities associated with dredging (trenching and borrow ground), spoil disposal and backfill. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.</p>				

Demonstration of Acceptability
<p>Acceptability Criteria and Assessment</p> <p>The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5):</p> <ul style="list-style-type: none"> • Overall impact significance levels for individual receptors are consistent with the levels rated in the Scarborough OPP. • EPOs and controls in the Scarborough OPP that are relevant to seabed disturbance have been adopted. • There are no changes to internal/external context specific to this risk from the Scarborough OPP. Following consultations with DNP on the potential risks to AMPs, the DNP noted it has no objections and claims at this time. Impacts from trenching, spoil disposal, borrow ground dredging and Trunkline backfill was raised during stakeholder consultation (Appendix F, Table 1) and these were considered in the finalisation of the EP.
<p>Acceptability Statement:</p> <p>The impact assessment has determined that, given the adopted controls, the Petroleum Activities Program is unlikely to result in an impact significance level greater than Minor. Further opportunities to reduce the impacts have been investigated above. The adopted controls are considered consistent with industry good practice and meet the requirements of Woodside relevant systems and procedures and stakeholder expectations. Woodside has undertaken a desktop assessments by qualified professionals, using remote sensing techniques, to identify known or potential underwater cultural heritage have been undertaken (refer to Section 4.9.1) and an unexpected finds procedure will be implemented (C 2.10). Therefore, the activity is not inconsistent with Underwater Cultural Heritage Guidance for Offshore Developments and the DRAFT Guidelines to Protect Underwater Cultural Heritage under the UCH Act. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of seabed disturbance to a level that is broadly acceptable.</p>

²¹ Permit for Entry into a Protected Zone or to Impact Underwater Cultural Heritage would be acquired under the UCH Act.

²² Gilmour et al (2016) states that the primary period of spawning for the region is in autumn. Autumn coral spawning CWES are defined as the 10 day period, five to 15 days after the predicted full moon in March and/or April, which is based on studies that have found that the majority of broadcast spawning species in Mermaid Sound spawn during neap tides approximately one week after the full moon (Gilmour et al. 2016). Spring coral spawning CWES are defined as the 10 day period, one to 11 days after the predicted full moon in November, which is based on studies that have demonstrated that Porites lutea spawns during spring tides predominantly 3 days after the full moon (Stoddart et al. 2012; Baird et al. 2011).

Description of Source of Impact														
This section assesses potential impacts from seabed disturbance resulting from Trunkline and ancillary structure(s) installation, pipeline and infrastructure crossings, other intervention works including continental slope excavation, PLET and foundations installation, ROV and survey activities.														
Trunkline Installation The Trunkline is dual diameter, with the diameter between the State Waters boundary and ~KP200 being nominal 36" and the remainder of the Trunkline to the FPU being nominal 32" diameter. From the shore to around ~KP160, the Trunkline will be routed alongside the existing Pluto gas trunkline (about 100 m to the south). Other structures installed by the PV (welded into the Trunkline during the normal lay process) include an in-line tee, two hot tap tees, foundations and ancillary structures. The disturbance footprint from installation of the Trunkline and other structures is expected to be approx 30m wide, along the Trunkline installation corridor.

A SWLB will install the nearshore section of the Trunkline up to around the State Waters boundary, however activities with this vessel may extend for a short distance into Commonwealth waters before handover to the PV. Anchoring will be required to moor the SWLB. Anchors will be moved as required via anchor handling tugs to move the SWLB along the trunkline route. During anchoring the seabed will be disturbed by the vessel anchor mooring system, including placement of anchors and chain/wire along the seabed, potential dragging during tensioning and recovery. Anchoring will occur within the Trunkline Project Area, up to 800 m either side of the trunkline and for approximately 3 km into Commonwealth Waters (1600 m x 3 km for anchoring footprint).

The PV may be required to temporarily moor on location via its anchor, in the case of a contingency scenario. This would be done within the Operational Area, away from subsea assets to prevent damage.

Pipeline and Infrastructure Crossings

The Trunkline route crosses existing subsea infrastructure including pipelines, flexible flowlines, umbilicals and fibre optic cables, which will require the installation of crossing supports. Three crossings lie within the Montebello AMP Multi Use Zone (Figure 3-2).

Indicative options for possible crossing supports and volumes are presented in Table 6-5. Possible crossing supports include rock berms (Section 3.9.6.1) and concrete mattresses (Section 3.9.6.2). A test dump may be carried out prior to rock berm installation within the Trunkline Project Area in a location free from existing infrastructure and not within the direct line of the trunkline route. The direct disturbance footprint will be determined by the length, number and height of the rock berms. Seabed disturbance associated with pipeline and infrastructure crossings may be over 30 m at the base for the centre rock berms, while at the tail ends of the crossings the footprint is reduced to only the pipeline width. Some settling of material may also occur wider than 30 m corridor. Where concrete mattresses are used, they will be installed either side of the existing subsea infrastructure. Typical concrete mattresses are 6 or 8 m by 3 m, with a thickness and stacking arrangement to suit the required span height, however they could be larger. This will be dependent on final design and seabed topography.

Table 6-5: Pipeline and infrastructure crossings

Crossing	KP	Support type ¹	Indicative Length ² (m)	Indicative Width ² (m)	Indicative Area ² (m ²)
Reindeer Pipeline (Santos)	75	Rock berm	800	21	16,800
Fibre Optic Cable 1 (Telstra)	136	Rock berm	300	15	4,500
Fibre Optic Cable 2 (Telstra)	150	Rock berm	300	15	4,500
Wheatstone Pipeline (Chevron)	191	Rock berm	400	25	10,000
Julimar Brunello Pipeline	192	Rock berm	600	21	12,600
Pluto Pipeline	194	Rock berm	500	21	10,500
Pyxis Pipeline	212	Concrete mattresses	60	20	1,200
Total					60,100

Note 1: Subject to final design

Note 2: Indicative only

Span Rectification

Span rectification (Section 3.10) may be required through the installation of structures, such as:

- concrete mattresses (typically 6 or 8 m x 3 m)
- grout bags (typically 200 kg to 2000 kg)
- rock installation
- seabed levelling and excavation (e.g. dredging using TSHD, mass flow excavators and jetting).

PLET & Foundations Installation

PLET foundations will be installed by a construction vessel and ROV. The PV will install the PLET at the end of the Trunkline and position it on top of pre-installed foundations (as described in Section 3.11.4). Scour mattresses may also be installed. Localised permanent seabed disturbance will be confined to the footprint of the PLET and foundations, as well as temporary disturbance and resuspension of sediments during ROV operations.

Continental Slope Crossing Seabed Preparation

The Trunkline along the continental slope requires seabed preparation to prevent excessive bending movements in the Trunkline and associated free span lengths where excavation will take place in water depths ranging between 550 m and 650 m (Section 3.9.5). At about KP 209 of the Trunkline route, seabed material will be excavated and/or displaced

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

over a length of approximately 150 m within a 300 m corridor (excluding placement of excavated material), which will allow appropriate pipeline span lengths. Approximately 5,000 – 15,000 m³ of material may be excavated to allow for safe pipelay operations.

The primary method of excavation is planned to be undertaken using an ROV controlled large volume grab (as described in Section 3.9.5). Secondary options to achieve the excavation profile are methods such as: mass flow excavation, conventional ROV dredging tooling and/or jetting to create the required trench.

For the primary method, several options for lateral movement of the material are considered. These include the use of a winch connected to a clump weight offset from the trunkline centreline; the use of a connected hose system to the grab; and by vessel navigation whereby a construction vessel is moved between excavated area and adjacent material placement location for each grab cycle; or a combination of these methods. Selection of lateral movement method(s) is subject to engineering in context of the local soils and confirmation of a stable permanent side slope angle.

Typically, the seabed footprint for the placement of excavated material is 100 m to 500 m from the trunkline centreline either side. In the case of free vessel navigation, material placement location may be up to 1 km from the trench centre line. Material will be placed parallel to the trench in an area not exceeding 0.10 km², based on an indicative area of 200 m by 200 m on either side, including the placement of a clump weight.

The final position of excavated materials may overflow beyond proposed seabed footprint due to fluidisation of the already very soft soils in the trench profile. This is unavoidable given the soil properties. It is expected sediments will settle further afield due to hydrographic conditions. A portion of the material excavated will end up dispersed in the water column with particles settling out away from the excavated area as a result of current and gravity, typically moving material down gradient. Any undulation as a result of excavation and spoil disposal is expected to be smoothed over time due to hydrographic conditions.

Geotechnical Surveys

Geotechnical surveys to confirm the seabed sediments (typically involving in situ testing and piston/push sampling) may be required to collect data to inform installation activities (see Section 3.9.1). Seabed disturbance can result from placing survey equipment on the seafloor, or when collecting seabed samples and will be <1 m². These activities will only occur within the Trunkline Project Area.

Underwater Acoustic Positioning

Accurate positioning of mattresses, rock berms or structures on the seabed is required, and therefore long base line (LBL) and/or ultra short baseline (USBL) acoustic positioning may be required in some instances (see Section 3.8.4). A beacon will be deployed for LBL acoustic positioning, which is generally attached by hydrostatic release to a clump weight (approximate footprint of <1 m²), allowing for recovery. If clump weights are used, they will be recovered.

ROV Operations

The use of an ROV is required during various Petroleum Activities Program activities (e.g., pre and post lay surveys, rock berms etc.) (see Section 3.8.3). Use of an ROV may result in temporary seabed disturbance and suspension of sediment as a result of working close to, or occasionally on, the seabed. ROV use close to or on the seabed is limited to that required for effective and safe subsea activities. The footprint of a typical ROV is about 2.5 m × 1.7 m (4.25 m²). It is noted that potential use of an ROV for continental slope crossing seabed preparation is addressed above.

Contingency Activities

Rock berms installed for infrastructure crossings may require rework by adding rock volume to reinstate berm height, width or slope angles using the RIV. Once the trunkline has been installed, sections may require de-burial in the event of a fault (or suspected fault) (Section 3.13.10). In the continental slope excavation area, re-profiling may also be required in case slumping/deterioration of the trench profile has occurred over time.

Equipment, materials or tools may need to be wet parked on the seabed in the Operational Area during installation of the trunkline. This could include, but not be limited to, work baskets for ROV tools, pig launcher/receiver prior/after connection to the PLET, scour mattresses etc.

Seabed Disturbance Summary

Table 6-6 provides details on the expected and maximum total seabed disturbance from Trunkline installation, pipeline and infrastructure crossings, other intervention works including continental slope excavation. All disturbance will occur within the Trunkline Project Area.

As detailed within Section 7.1.6.1 of the Scarborough OPP (SA0006AF0000002, Rev 5), the maximum allowable disturbance area of 12.9 km² is based on an indicative trunkline disturbance corridor width of 30 m, encompassing the trunkline for the entire 430 km (of which about 400 km are in Commonwealth waters). This is considered a conservative disturbance estimate, as while there will be a few locations along the trunkline route where seabed disturbance extends wider than 30 m (e.g. slope crossing), the average width of seabed disturbance across the entire trunkline route is expected to be less than 30 m.

Approximately 83 km of trunkline will extend into Montebello AMP between KP 109 and KP 192, equating to approximately 2.48 km² overlap (allowing for a 30 m disturbance area on the trunkline). Surveys (Sections 3.9.1 and 3.11.1) pipeline and infrastructure crossing (Section 3.9.6) and span rectification activities (Section 3.10) may be undertaken within the AMP as part of the Petroleum Activities Program.

Table 6-6: Trunkline installation and associated activities seabed disturbance summary (Commonwealth waters)

Activity	Description	Expected disturbance area (km ²)	Maximum allowable disturbance area (km ²)
Trunkline installation	Trunkline on seabed and ancillary structures	2.07	11.46 ¹
	Pipeline and infrastructure crossings (see summary above)	0.06	
	Continental slope crossing seabed preparation (and material placement)	0.10	

Note 1: This value has been amended to account for Commonwealth waters only (e.g. 400 km trunkline) and to remove potential duplication associated with trenching, spoil disposal and backfill between KP32 and KP50 which has been allowed for in Section 6.7.2.

Detailed Impact Assessment

Assessment of Potential Impacts

Seabed disturbance has the potential to result in the following impact(s):

- a change in habitat
- a change in water and sediment quality.

Which may have the following further impacts

- injury and/or mortality to fauna.

These are described in full in Section 7.1.6 of the Scarborough OPP (SA0006AF0000002, Rev 5), with no additional impacts identified for this EP. Where activities are consistent with those described in the Scarborough OPP, this section provides a summary of the assessment outcomes in the context of the Petroleum Activities Program covered by this EP. Where additional definition in relation to risks and impacts are available, this section provides additional detail as part of the impact assessment.

Water and Sediment Quality

The installation of the subsea infrastructure, including the trunkline and PLET/foundations; span rectification and pipeline and infrastructure crossings (e.g. rock berms, mattresses); and anchors for the SWLB (if required) will result in temporary and localised displacement of surface sediments within the Trunkline Project Area. The displacement of naturally occurring sediments from these activities is likely to result in highly localised (within tens of metres of the disturbance area) and low level increases in turbidity at the seabed that will quickly disperse in the oceanic marine environment due to prevailing hydrodynamic conditions. Any reduction in water quality is likely to be temporary, and limited to the waters close to the seabed immediately surrounding the disturbance area. The resulting low levels of sediment deposition are likely to be naturally reworked into surface sediment layers through bioturbation.

Continental slope crossing seabed excavation will result in sediment mobilisation from displacement/relocation of sediments along the trunkline at approximately KP 209, subsequently resulting in a localised and temporary change in water quality. Sediments of the continental slope are typically soft sediments and mud, and as such excavated materials may overflow beyond proposed seabed footprint due to fluidisation of the already very soft soils in the trench profile. It is expected a portion of the material excavated will end up dispersed in the water column with finer particles likely to settle further afield due to hydrographic conditions, typically moving material down gradient. The short term nature of the activity means that elevations in turbidity at depth is likely to be temporary in nature and rapidly return to background levels.

Potential impacts to benthic habitats, including the values of AMPs and KEFs along the trunkline route are evaluated below.

Impacts from seabed disturbance on water and sediment quality will be slight. Receptor sensitivity of water and sediment quality is low (low value, open water), and therefore the Impact Significance Level of seabed disturbance on water and sediment quality is **Negligible (F)**.

Epifauna and Infauna

Seabed disturbance and potential impacts to epifauna and infauna will occur as a result of the mobilisation and/or displacement of sediments along the trunkline and placement of infrastructure. Disturbance to the seabed can alter the physical seabed habitat conditions, resulting in epifauna and infauna community changes (Newell et al., 1998). Potential impacts include:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Direct impacts, including physical removal and irreversible loss of benthic communities and habitat and temporary alteration of the existing hydrodynamic regime within the direct footprint of activities.
- Indirect impacts caused by reduced water quality or increased sedimentation, including indirect effects on filter feeder-sponge habitat through reduced light availability for photosynthesis of the sponges' symbionts and reduced filtering and feeding (Abdul Wahab et al., 2019).

The installation of the subsea infrastructure, including the trunkline; and PLET/foundations; span rectification and pipeline and infrastructure crossings (e.g. rock berms, mattresses); and anchors for the SWLB (if required) will result in permanent and localised loss of epifauna and infauna over the infrastructure footprint. As detailed in Section 4.5.2, the Trunkline Project Area is not expected to support abundant or diverse benthic communities, and those that are present are considered typical of the North West Shelf.

In the long term, the trunkline, PLET and foundations, span rectification and infrastructure crossing materials will provide hard substrate to the marine environment for the duration of the activity, which may support epifaunal communities. Habitats and the species present on these types of structures in the NWS of Western Australia have been subject to detailed assessment by McLean et al. (2020), McLean et al. (2018), Bond et al. (2018) and McLean et al. (2017). These habitats not only have structural complexity but also create habitat for a large diversity of fish species that commonly occur elsewhere in the NWS but do not occur over soft unconsolidated sediments.

KP 32 to KP 50: Between the State waters boundary (KP 32) and ~KP 50, the trunkline will be installed within the pre-excavated trench. Potential impacts associated with trenching, spoil disposal, borrow ground dredging and backfill are evaluated in Section 6.7.2. The trunkline will therefore be laid in a pre-disturbed area and additional disturbance is not anticipated.

KP 50 to KP 109: As described in Section 4.5.2, the seabed between KP 52.5 and KP 109 is generally featureless with occasional areas where the underlying calcarenite is intermittently exposed that may support patches of benthic filter feeder communities. The calcarenite outcrops generally run perpendicular to the trunkline and are spread widely over the North West Shelf (Wilson, 2013). Any intersections of the isolated calcarenite outcropping identified from the geophysical data represent a very small area (<0.01km²), given the 36 inch diameter of the pipeline. The magnitude of impact to epifauna and infauna within this portion of the Trunkline Project Area will be minor given the localised footprint of disturbance and associated temporary increase in turbidity

KP 109 and KP 192 (Montebello AMP): The trunkline route intersects the Montebello AMP between KP 109 and KP 192, however the seabed along the South East corner of the Montebello Islands Australian Marine Park between KP 109 and KP 145 is generally featureless, with some calcarenite outcrops intersecting the trunkline route from KP 117.7 (Section 4.5.2). Keesing (2019) showed that the topography in the vicinity of the Scarborough trunkline is predominantly flat bottom with some occasional bioturbated areas, and the substrate is typically fine sands. These sites within the vicinity of the Scarborough trunkline had low numbers of sponges, whips and gorgonians and as a result, complex benthic filter feeder communities were largely absent. From KP 145 to KP 192 the seabed starts off generally featureless with the exception of some small depressions. From approximately KP 173 the calcarenite exhibits subtle northeast-southwest oriented lineations observed in the bathymetry, but a veneer of sediment is thought to cover these outcrops. An ROV survey of the trunkline route within the Montebello AMP conducted in 2019 (Advisian 2019b) found the area in which the trunkline intersects the North West section of the Montebello AMP to be characterised by bare sandy sediments, interspersed with predominantly sparse benthic communities and epifauna. Denser areas of filter feeders were observed in areas identified from the bathymetry as having a more complex seabed structure, refer to Area 5 in Table 4-5. Though this area did not cross the trunkline route. In addition these areas of filter feeding benthos (sponges, soft corals, gorgonians, hydroids, sea pens, crinoids) are widely representative of benthos found both within the AMP (Advisian, 2019a) and regionally (refer to Section 4.5.2).

Potential impacts to epifauna and infauna from trunkline installation within the Montebello AMP are minor based on the localised area of disturbance from installation of the 36 inch diameter pipeline and associated infrastructure crossing/span rectification supports.

Potential impacts to the values of the AMP are evaluated further in the AMP section below.

KP 192 to Continental Slope: From KP 192 to the continental slope the seabed is generally featureless (Section 4.5.2). Epifauna was observed by ROV footage to be most abundant on the continental shelf compared to the slope and the abundance of the fauna appeared to be inversely associated with depth, with distinct differences in the fauna on the shelf and slope. Soft sediment benthic communities are dominated by infauna (including molluscs, crustaceans and worms) and isolated larger fauna (free swimming cnidarian, demersal fish and benthic crustaceans) and therefore negligible impacts are expected from the installation of the trunkline.

Continental slope crossing seabed preparation at approximately KP 209 is expected to result in direct impacts to epifauna and infauna within the excavation footprint and area of material relocation. Given the sediment characteristics, which consist of very soft clay layer overlying a loose silty sand deposit, some of fines mobilised during the seabed preparation activity are also likely to disperse further afield. Based on the geotechnical properties, some excavated sediment placed in the designated areas may relocate down-gradient, similar to natural relocation of sediments in this area. These temporary elevations in turbidity and subsequent sediment deposition have the potential to indirectly affect filter feeder-sponge habitat through smothering. Given the volume and soil type (soft sediments and mud), minor elevations in turbidity are expected near the seabed, with low levels of sediment deposition further afield. Based on ROV transects undertaken in the area (Advisian, 2019a), the seabed within the KP 209 area is expected to be

predominantly bare sand habitat with a sparse coverage of epibenthic organisms, such as heterotrophic sponges and soft corals.

Rock pinnacles have been observed approximately 3 km from the slope crossing seabed preparation location, at KP 209, as shown in Figure 4-6 and Figure 4-7. However, impacts from turbidity on species associated with these formations are not expected given the distance and that the pinnacles are located upslope of the trunkline whereas sediments are expected to deposit downslope.

Impacts from seabed disturbance on epifauna and infauna along the trunkline between KP 192 and across the continental slope will be minor based on the localised footprint of disturbance and temporary elevations in turbidity associated with the slope crossing seabed preparation activity. Receptor sensitivity of epifauna and infauna is low (low value, homogenous).

Impacts to the values of the Continental Slope Demersal Fish Communities KEF, which intersects the continental slope crossing seabed preparation area, are evaluated below.

Deep Continental Slope to PLET: Seabed material along the proposed Trunkline Project Area in deeper waters (and around the PLET location) is predominantly flat and featureless and comprises thick, unconsolidated fine-grained sands, supporting sparse marine fauna as reported for the Exmouth Plateau (Section 4.5.2). Impacts from seabed disturbance in the deep continental slope and out to the PLET location will be minor given the localised footprint of disturbance and low receptor sensitivity.

Marine Turtles

Five species of marine turtle may occur in the Trunkline Project Area: flatback, green, hawksbill, loggerhead and leatherback turtles. The Trunkline Project Area overlaps internesting habitat critical and BIAs (internesting buffer) for flatback, green and hawksbill turtles around the Dampier Archipelago and Montebello Islands (Section 4.6).

The Recovery Plan for Marine Turtles in Australia (DoEE, 2017) identifies habitat modification from infrastructure/coastal development as a threat to the stocks of flatback, green, and hawksbill turtles in the North West Shelf and Pilbara region.

Based on the defined 30 m width of the indicative Trunkline disturbance area, the areas of overlap with the habitat critical to each species of marine turtle are as follows:

- Flatback turtle: habitat critical – overlap area 5.17 km²; 0.012%.
- Green turtle: habitat critical – overlap area 0.62 km²; 0.013%.
- Hawksbill turtle: habitat critical – overlap area 0.62 km²; 0.013%.

Potential impacts to turtles from dredging, spoil disposal and backfill activities are assessed in Section 6.7.2. Impacts from seabed disturbance during trunkline installation and associated activities will be highly localised and temporary in nature. It is unlikely that internesting turtles will occur in the Trunkline Project Area near the Montebello Islands, where water depths range between 46 m to 214 m (as described in Section 6.7.2). These deep, offshore waters at the furthest extent of the internesting buffer habitat critical are not likely to represent important internesting habitat, as described in Section 6.7.2. Therefore, seabed disturbance within the Trunkline Project Area near the Montebello Islands is not expected to displace turtles from the internesting buffer habitat critical.

Whilst the Trunkline Project Area adjacent to the Dampier Archipelago overlaps internesting buffer habitat critical for flatback, green and hawksbill turtles (refer Figure 4-10), the extent of overlap between the defined 30 m width of the indicative Trunkline disturbance area and these habitat critical areas is extremely low (<0.02% - see above). The shallowest point of the Trunkline Project Area occurs in waters adjacent to the Dampier Archipelago (approximately 30 m depth), and internesting flatback, green and hawksbill turtles are unlikely to utilise the habitats at these depths. Therefore, seabed disturbance within the Trunkline Project Area adjacent to the Dampier Archipelago is not expected to adversely impact on biologically important behaviours or biologically important habitat, including habitat critical to the survival of marine turtles. The Operational Area is not likely to represent important internesting habitat for flatback, green and hawksbill turtles, and any displacement of individuals from areas utilised as foraging habitat will not result in any significant impacts at a population level.

Impacts from seabed disturbance on marine turtles will be slight. Receptor sensitivity of marine turtles is high, and the Impact Significance Level of seabed disturbance on marine turtles is **Minor (D)**.

Australian Marine Parks

The Trunkline Project Area intersects the Montebello AMP (Multiple Use Zone (VI)) between KP 109 to KP191. This equates to an approximate 2.48 km² overlap (allowing for a 30 m disturbance area for the trunkline). This conservative disturbance area represents 0.07% of the Montebello Marine Park, including the area intersecting the Ancient Coastline KEF. Between KP 109 and KP 160 the trunkline will be routed alongside the existing Pluto gas trunkline (about 100 m to the south). The trunkline will be nominal 36 inches in diameter and will be installed by the DP PV through the Montebello AMP, therefore no mooring will be required.

A description of the epifaunal communities in the Montebello Islands AMP is provided in Section 4.8. The trunkline intersects an area of sparse epifauna in the South Eastern section of the AMP and intersects areas of slightly more abundant and diverse epifauna in the North Western section of the AMP (Advisian 2019a and 2019b, Keesing 2019). However these areas are typical of the benthos found both within the marine park and regionally. Benthic organisms (including sponges and soft corals) generally occur as single or low density aggregations of individuals with isolated

denser areas of sponges in areas identified from the bathymetry as having a more complex seabed structure (Advisian, 2019b).

The pipeline alignment was selected to ensure the intersections with harder more complex areas of seabed are minimised with the pipeline generally running perpendicular to these areas. This minimises any direct loss of sponges which are generally associated with these areas of more complex bathymetry in the Montebello AMP. The majority of the trunkline route within the Montebello AMP will also run adjacent to the existing Pluto trunkline ensuring there is minimal disturbance to new areas of the AMP. The trunkline route has also been selected to minimise the seabed disturbance, with alternative options requiring additional seabed intervention (refer to Section 4.5 and 4.6 of the Scarborough OPP).

Three infrastructure crossings lie within the Montebello AMP Multiple Use Zone, which will require the use of rock berms (refer to Section 3.9.6.1). The expected average footprint for seabed disturbance associated with infrastructure crossing materials is the 30 m disturbance corridor, however in some sections may be narrower or wider.

Given that epifaunal communities are well represented either side of the proposed trunkline route (Advisian 2019) and regionally (Keesing 2019) and that the footprint of the trunkline is extremely small in comparison with the spatial extent of these communities in the North Western section of the Montebello AMP, the presence of the trunkline will not destroy, fragment, or isolate these communities. Nor will it disturb a substantial area of habitat given the narrow footprint of the trunkline. In the long term, the trunkline and crossing materials will provide hard substrate to the marine environment for the duration of the activity, which may support epifaunal communities (McLean et al. 2020; McLean et al. 2018; Bond et al. 2018; McLean et al. 2017).

The North-west Marine Parks Network Management Plan (DNP, 2018a) lists natural values of the Montebello AMP as including a range of threatened, migratory, marine or cetacean species listed under the EPBC Act, as well as BIAs that include seasonal breeding habitat for seabirds, internesting, foraging, mating, and nesting habitat for marine turtles, a migratory pathway for humpback whales and foraging habitat for whale sharks. Of those listed, the most susceptible species to seabed disturbance are marine turtles.

Relevant critical habitat and BIAs that intersect the Trunkline Project Area in the Montebello AMP include an internesting buffer and an internesting BIA for flatback turtles. The conservative disturbance area of approximately 2.48 km² represents <0.01% of the habitat critical for flatback turtles around the Montebello Islands, and the relatively deep offshore waters where the trunkline disturbance corridor overlaps the northern extent of the Montebello AMP (46 m to 214 m) do not represent important internesting habitat for flatback turtles (refer above). Impacts to foraging habitat for turtles in this area from seabed disturbance are expected to be minimal given the limited area of disturbance and sparse epifaunal communities.

As outlined above, impacts from seabed disturbance during trunkline installation and associated activities will be highly localised and temporary in nature and as such they are not expected to impact upon threatened, migratory, marine or cetacean species listed under the EPBC Act, or Biologically important areas for seabirds, turtles or migrating humpback whales. Therefore, no impacts are expected to the cultural values of the AMP as those are intrinsically linked to the natural values described above.

Impacts from seabed disturbance on the Montebello AMP will be slight and are not inconsistent with the objectives of the North-west Marine Parks Network Management Plan or the zoning of the Montebello AMP (DNP, 2018a). Receptor sensitivity of AMPs is high (high value habitat). The Impact Significance Level of seabed disturbance on AMPs has been identified as **Minor (D)**.

KEFs

Three KEFs overlap the Operational Area (Table 6-7). The location and values of the KEFs are summarised below:

- Exmouth Plateau KEF (intersects the Trunkline Project Area at KP 375 for about 60 km): Values and sensitivities are related to seafloor features. These seafloor features may promote enhanced upwelling.
- Ancient Coastline KEF (intersects the Trunkline Project Area at KP 200 for about 3 km): The KEF includes areas of hard substrate, and higher diversity and species richness relative to surrounding areas of predominantly soft sediment. The submerged coastline may facilitate mixing of the water column enhancing productivity. Combined with greater diversity of sessile benthic organisms, this may increase abundance of pelagic species such as fishes and cetaceans, impacts to which are discussed above.
- Continental Slope Demersal Fish Communities KEF (intersects the Trunkline Project Area at KP 201 for about 9 km). The KEF represents high levels of endemism of demersal fish species.

Small areas of seabed in three KEFs will be disturbed as a result of activities associated trunkline installation. Activities within each of the KEFs and associated seabed disturbance area are detailed in Table 6-7.

Table 6-7: Potential Petroleum Activities Program within KEFs and disturbance

KEF	Activities which may occur within KEF	Disturbance within KEF (%) based on 30 m disturbance
Exmouth Plateau KEF	Trunkline installation and span rectification	<0.0035

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Ancient Coastline at 125 m Depth Contour KEF	Trunkline installation and span rectification	<0.0004
Continental Slope Demersal Fish Communities KEF	Trunkline installation and continental slope crossing seabed preparation ¹	<0.0007

¹ Note that the final position of excavated materials from continental slope crossing seabed preparation may disperse beyond proposed seabed footprint due to fluidisation of the already very soft soils in the trench profile.

Physical habitat modification is not listed as a potential concern for Exmouth Plateau KEF or Ancient Coastline at 125 m Depth Contour KEF and therefore impacts to the values of these KEFs are not anticipated. Physical habitat modification is listed as a potential concern for the Continental Slope Demersal Fish Communities KEF; however, the total impact area is small, and impacts will be highly localised to the Trunkline Project Area.

Impacts are not likely to be significant from trunkline installation and associated activities as the disturbance will occur in a small proportion of each of the KEFs and avoids important or substantial areas of habitat, including hard substrates of the Ancient Coastline at 125 m Depth Contour KEF.

Impacts from seabed disturbance to the KEFs will be slight. Receptor sensitivity of KEFs is high (high value), and therefore Impact Significance Level of seabed disturbance on KEFs is **Minor (D)**.

Total Seabed Disturbance

Table 6-8 provides details on the expected and maximum total seabed disturbance from seabed intervention and trunkline installation activities as defined in Section 6.7.2 and Section 6.7.3. All disturbance will occur within the Trunkline Project Area and Borrow Ground Project Area

Table 6-8: Estimated seabed disturbance summary (Commonwealth waters)

Activity	Description	Expected disturbance area (km ²)	Maximum allowable disturbance area (km ²)
Trunkline installation	Pipelay on seabed	2.07	12 ¹
	Pipeline and infrastructure crossings (see summary above)	0.06	
	Continental slope crossing seabed preparation (including material placement)	0.10	
Trunkline trenching, spoil disposal and backfill	Trunkline trenching and backfill ²	0.24	17
	Spoil Ground 5A material disposal ³	1.60	
Offshore borrow ground dredging	Dredging within offshore borrow ground to source material for backfill	4.00	17

Note 1: Expected disturbance area assumes Commonwealth waters only

Note 2: Expected disturbance area assumes KP32 to KP40, although impact assessment and maximum extent is to KP50

Note 3: Disturbance located within previously disturbed ground

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity Level	Magnitude	Impact Significance Level
Water quality	Change in water quality	Low value	Slight	Negligible (F)
Sediment quality	Change in sediment quality	Low value	Slight	Negligible (F)
Epifauna and infauna	Change in habitat	Low value	Minor	Slight (E)
Marine turtles	Change in habitat Injury/mortality to fauna	High value	Slight	Minor (D)
AMPs	Change in habitat Change in water quality	High value	Slight	Minor (D)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

KEFs	Change in habitat Change in water quality Injury/mortality to fauna	High value	Slight	Minor (D)
------	---	------------	--------	-----------

Overall Impact Significance Level: The overall impact significance level for disturbance to benthic habitat from trunkline installation and associated activities is D based on a minor impact to the most sensitive receptors (marine fauna, AMPs and KEFs). The impact significance levels for individual receptors are consistent with the levels rated in the Scarborough OPP. Noting that cultural values and heritage is a risk not included in the Scarborough OPP.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation, Codes and Standards				
Activities under the Petroleum Activities Program will be carried out in accordance with any protection declarations relevant to the Operational Area, under Sections 9,10,12 of the ATSIHP Act	F: Yes CS: Costs associated with the implementation	Implementation of the control ensures any impacts to significant Aboriginal areas and significant Aboriginal objects protected by Ministerial declaration, are acceptable under the standards of the ATSIHP Act.	Control based on legislative requirements – must be adopted.	Yes C 2.9
Good Practice				
Infrastructure will be placed on the seabed within the design footprint using positioning technology	F: Yes. This is a standard practice and benefits project requirements aiding placement as per design requirements. CS: Costs associated with improved accuracy/tolerance for implementation	Positioning infrastructure within the design footprint will reduce the potential magnitude of impact.	Benefits outweigh cost/sacrifice	Yes C 3.1
Span rectification design for the continental slope crossing is engineered such that seabed excavation is minimised	F: Yes. This is considered good practice. CS: Costs associated with excavation of minimum amount of material to achieve the required design parameters. However cost benefits may also be realised should excavation duration be shortened as a result of reduced excavation requirements.	Avoids unnecessary excavation and hence disturbance of seabed sediments.	The control would significantly reduce the risk of impacts from direct seabed disturbance. Reducing excavation volumes may also reduce project costs (e.g. time).	Yes C 3.2
Excavated material for the continental slope crossing will be placed in a designated areas parallel to the trench.	F: Yes. This is considered good practice. CS: Costs associated with placement accuracy	Placing excavated material within designated areas will reduce the potential magnitude of impact.	Benefits outweigh cost/sacrifice	Yes C 3.3

Benefits outweigh cost/sacrifice.	Yes C 2.12
Professional Judgement – Eliminate				
Do not use ROV close to, or on, the seabed.	F: No. The use of ROVs (including work close to or occasionally landed on the seabed) is critical as the ROV is the main tool used to guide and manipulate equipment. ROV usage is already limited to only that required to conduct the work effectively and safely. Due to visibility and operational issues ROV work on or close to the seabed is avoided unless necessary. CS: Not assessed control not feasible.	Not assessed, control not feasible.	Not considered – control not feasible.	No
Professional Judgement – Substitute				
No additional controls identified.				
Professional Judgement – Engineered Solution				
No additional controls identified.				
ALARP Statement				
On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.3.3), Woodside considers the adopted controls appropriate to manage the impacts of seabed disturbance from trunkline installation and associated activities. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.				

Demonstration of Acceptability
Acceptability Criteria and Assessment
The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5):

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Overall impact significance levels for individual receptors are consistent with the levels rated in the Scarborough OPP.
- EPOs and controls in the Scarborough OPP that are relevant to seabed disturbance have been adopted.
- There are no changes to internal/external context specific to this risk from the Scarborough OPP, including issues raised during stakeholder consultation. Following consultations with DNP on the potential risks to AMPs, the DNP noted it has no objections and claims at this time
- Ongoing consultation with MAC identified concerns associated with activities of this EP in Commonwealth waters, to address relevant concerns (see Appendix F, Table 1) additional controls (C 2.7 and C 2.8) have been included in the EP. In addition, recent engagement with MAC has confirmed they have no concerns at this time.

Acceptability Statement:

The impact assessment has determined that, given the adopted controls, the Petroleum Activities Program is unlikely to result in an impact significance level greater than Minor. Further opportunities to reduce the impacts have been investigated above. The adopted controls are considered consistent with industry good practice and meet the requirements of Woodside relevant systems and procedures and stakeholder expectations.

6.7.4 Routine Light Emissions from Project Vessels

Scarborough OPP – Relevant Impact Assessment Section														
Section 7.1.1 – Routine Light Emissions														
Context														
Relevant Activities Vessel Operations – Section 3.7				Existing Environment Marine Regional Characteristics – Section 4.2 Protected Species – Section 4.6				Stakeholder consultation Consultation – Section 5						
Impact/Risk Evaluation Summary														
Source of Impact/Risk	Environmental Value Potentially Impacted						Evaluation							
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (inc. odour)	Ecosystems / Habitat	Species	Socio-economic	Decision Type	Impact/Consequence	Likelihood	Current Risk Rating	ALARP Tools	Acceptability	Outcome
Light emissions from project vessels						✓		A	E	-	-	GP	Broadly Acceptable	EPO 5, 6, 10, 11, 12
Description of Source of Impact/Risk														
<p>Vessel Operations</p> <p>Project vessels will have external lighting to support safe operations at night, as well as to communicate the presence and activities of project vessels to other marine users (i.e. navigational lights). This lighting typically consists of bright white (i.e. metal halide, halogen, fluorescent) lights, and is not dissimilar to lighting used for other offshore activities, including fishing and shipping. Lighting is required for the safe operation of the project vessels and cannot reasonably be eliminated.</p> <p>Project vessel light emissions in any one area will be limited by the transient nature of the works along the trunkline route and the cycling of dredging and backfill between the Offshore Borrow Ground Project Area, Trunkline Project Area and disposal of material in Spoil Ground 5A. The Petroleum Activities Program may not be executed as a single campaign or in a consecutive sequence, therefore light emissions may occur at any time during the period of the EP. Once the activities are completed, no permanent ongoing project lighting will occur in these locations.</p> <p>Based on the recommendations of the National Light Pollution Guidelines for Wildlife (NLPG – Commonwealth of Australia, 2020), the Scarborough OPP (Section 7.1.1.2) considered the activities within 20 km of land, approximately 8 km into Commonwealth waters between KP 32 and around KP 40.</p> <p>The TSHD and pipelay vessels have the greatest potential for impacts from light emissions based on their size (PENV, 2020a; 2022). The effect of sky glow may occur at distances greater than 20 km for some species and under certain environmental conditions; however, the 20 km threshold provides a nominal distance at which light impacts should be considered (Commonwealth of Australia, 2020). Indicative activities that will be conducted within 20 km of land, including estimated duration, are outlined in Table 6-9. These activities were used as assumptions for modelling of light emissions for the Petroleum Activities Program. They are therefore conservative estimates and do not necessarily reflect vessel schedules for these activities.</p> <p>For measuring the impact of Artificial Light At Night (ALAN) on marine turtles, PENV has developed an approach based on the visibility of the full moon. Modelling undertaken (Section 7.1.1.1 of the Scarborough OPP) indicated that light emissions were predicted to reduce to ambient levels (0.01, or 1%, radiance of a full moon) at 5.7 km and 4.7 km from the PV and dredging vessel (TSHD), respectively (PENV, 2020a). Additional modelling completed in 2022, predicted</p>														

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

that light emissions would reduce to 0.01, or 1% radiance of a full moon (equivalent to the light output of the first quarter moon) within 5.7 km (PV), 3.2 km (TSHD) and 5.8 km (RIV) (PENV 2022).

Due to spatial and temporal separation of seabed intervention and trunkline installation activities, there is minimal opportunity for concurrent operations within the Petroleum Activities Program in the environments significant to light sensitive fauna (i.e. turtles and seabirds). As discussed in Section 6.2.1 and detailed in Table 6-1 the primary location of concurrent activities is the permit area WA-61-L. As such, cumulative impact from light as a result of concurrent operations is not considered credible. The modelling carried out for light impact assessment (PENV, 2020a) is representative of the maximum vessel spread (DP Pipelay vessel installation spread) due to its consideration of the PV, which eclipses support/supply vessel light emissions due to its size and lighting configuration and the nature of light emissions being non-additive.

Table 6-9: Indicative trunkline installation and stabilisation activities within 20 km of land Activity (light modelling)

Activity	Estimated duration	Location	Vessels
Hydrographic, geophysical and geotechnical surveys	8-weeks Vessel continuously present within project areas and constantly moving	Trunkline and Borrow Ground Project Areas	DP survey vessel
Pre-lay trenching and spoil disposal	8-weeks Vessel continuously present within project areas and constantly moving	Trunkline Project Area	Trailing suction hopper dredger (TSHD)
Pipelay	3.5-weeks Vessel continuously present within project areas and constantly moving	Trunkline Project Area	Pipelay Vessel (PV)
Pre-lay and post span rectifications (rock and/or mattress)	2-weeks Intermittent activity: Activities at individual location ~48 hours	Trunkline Project Area	Construction Vessel (CV)/Rock Installation vessel (RIV)
Post-lay borrow ground dredging and backfill	8-weeks Intermittent activity: 2-hours dredging at borrow ground, material transported to trunkline for backfill. Material from borrow grounds placed in trench (up to 5-hours), return to borrow grounds	Trunkline and Borrow Ground Project Areas	TSHD vessel and support

Detailed Impact Assessment

Assessment of Potential Impacts

Routine light emissions generated by offshore activities has the potential to result in the following impact(s):

- a change in ambient light
- a change in fauna behaviour (marine reptiles, seabirds and migratory shorebirds)
- a change to the functions, interests or activities of other users

Ambient Light

The introduction of light emissions from activities associated with the Petroleum Activity Program can result in a temporary change to ambient light.

Existing light sources at the eastern end of the Trunkline Project Area (within 20 km of land) include heavy vessel traffic within the Pilbara Port Authority (PPA) Management area and 26 designated anchorages for bulk carriers, petroleum and gas tankers, drilling rigs, offshore platforms, and pipelay vessels located offshore of Rosemary Island. These anchorages are located between Rosemary Island and the Trunkline Project Area. Although light monitoring within the Dampier Archipelago has not been undertaken, existing light pollution in this area is expected to be high (Commonwealth of Australia, 2017a). As described above, the TSHD and pipelay vessels have the greatest potential for light emissions based on vessel size and associated lighting (PENV, 2020a).

It is considered that the contribution of light emissions from the Petroleum Activities Program will be comparable with existing vessels and facilities on the NWS and will not result in a notable increase within the nearshore/PPA area.

The NLPG address potential impacts to marine turtles, seabirds and migratory shorebirds from artificial light at night (ALAN) (Commonwealth of Australia, 2020). The aim of the Guidelines is for artificial light to be managed so wildlife is: 1) not disrupted within, nor displaced from, important habitat; and 2) able to undertake critical behaviours such as

foraging, reproduction and dispersal. The guidelines recommend best practice lighting design principles, however implementation of these may not always be possible when contracting existing vessels. The guidelines also recommend a specific artificial light impact assessment process where there is important habitat for listed species that are known to be affected by artificial light within 20 km of a project. The 20 km threshold provides a precautionary limit based on observed effects of sky glow on marine turtle hatchlings demonstrated to occur 15-18 km from onshore LNG and alumina facilities (Kamrowski, et al., 2014; Hodge et al., 2007) and fledgling seabirds grounded in response to artificial light up to 15 km, as reported for short-tailed shearwaters on Philip Island (Rodríguez et al., 2014).

The Operational Area is located offshore. The Offshore Borrow Ground Project Area is 6.6 km from the nearest island or other emergent features (Legendre Island) and the Trunkline Project Area is 12 and 14 km from the nearest islands (Legendre and Rosemary Islands, respectively). The Operational Area is within known BIAs for marine turtles and seabirds/migratory shorebirds, therefore a specific study for artificial lighting is required under the guidelines, and was completed as part of the Scarborough OPP development and additional modelling completed by PENV for the PV, TSHD and RIV in 2022.

For measuring the impact of Artificial Light At Night (ALAN) on marine turtles, PENV has developed an approach based on the visibility of the full moon. Modelling predicted that light emissions would reduce to 0.01, or 1% radiance of a full moon (equivalent to the light output of the first quarter moon) within 5.8 km (RIV), 5.7 km (PV) and 3.2 km (TSHD) (PENV 2022). At this level, light or light glow is visible but impact on hatchling behaviour is considered unlikely (i.e., not biologically relevant) (Aube et al., 2005).

There is potential for behavioural impacts to marine turtles to occur (greater than 0.1 full moon equivalent) within 1.8 km (PV), 1.2 km (RIV), and 0.7 km (TSHD) (PENV 2022), but behavioural impacts are more likely (greater than radiance of one full moon) within 0.6 km (PV), 0.3 km (RIV), and 0.2 km (TSHD) (PENV 2022).

Change in Fauna Behaviour

Marine Turtles - Adults

The Recovery Plan for Marine Turtles in Australia 2017-2027 (Commonwealth of Australia, 2017a) identifies light pollution as a high risk threat to marine turtles in the NWS region, including the relevant stocks of green, flatback and hawksbill turtles surrounding the Operational Area. The plan indicates that artificial light may reduce the overall reproductive output of a stock, and therefore recovery of the species, by: 1) inhibiting nesting by females, 2) creating pools of light (i.e. light spill) that attract hatchlings and increased predation, and 3) disrupting hatchling behaviour and sea finding behaviour (Commonwealth of Australia, 2017a).

Artificial lighting may affect where nesting adult turtles emerge onto the beach, the success of nest construction, whether nesting is abandoned, and the seaward return of adults (Salmon et al., 1995a, 1995b; Salmon and Witherington, 1995, Witherington and Martin, 2003). Such lighting is typically from residential and industrial development at the coastline, rather than offshore from nesting beaches. There is no evidence, published or anecdotal, to suggest that internesting, mating, foraging or migrating turtles are impacted by light from offshore vessels. Although individuals undertaking internesting, migration, mating (adults) or foraging (adults and pelagic juveniles) may occur within the Operational Area, marine turtles do not use light cues to guide these behaviours, and therefore light emissions from project vessels are unlikely to result in displacement of, or behavioural changes to individuals during these life stages (PENV, 2020a).

The Operational Area overlaps internesting habitat critical to the survival (nesting and internesting) and BIAs for green, flatback and hawksbill turtles. Adult female turtles will spend several months in the shallow coastal marine environment in proximity to nesting beaches. Pendoley (2005b) provides details of tracking data for green and hawksbill turtles nesting on Rosemary Island. Results suggested that nesting female hawksbill turtles remained within 1 km of nesting beaches on Rosemary Island (Pendoley, 2005b). Female green turtles travelled greater distances, up to 5 km, but typically remained within shallow, nearshore waters between 0 and 10 m deep (Pendoley, 2005b). The 60 km internesting buffer for flatback turtles in the Recovery Plan for Marine Turtles in Australia (DoEE, 2017) is based primarily on the movements of tagged internesting flatback turtles along the North West Shelf from a 2014 study, which found that flatback turtles may demonstrate internesting displacement distances up to 62 km from nesting beaches (Whittock et al., 2014). However, these movements were confined to longshore movements in nearshore coastal waters or travel between island rookeries and the adjacent mainland (Whittock et al., 2014). The flatback turtle internesting habitat along the North West Shelf has since been defined more precisely using satellite tracking of 47 turtles, combined with a range of environmental variables (Whittock et al., 2016a). Suitable internesting habitats were identified as water depths of 0 – 16 m, within 5 – 10 km of the coastline.

Seasonality of nesting differs between flatback, green and hawksbill turtle species. Whiting (2018) provides defined seasonality specific nesting data for Rosemary Island and found that hawksbill turtles have a much earlier peak (October/November) compared to flatback turtles (December/January peak). Seasonality for green turtles was not well defined from the available data (Whiting, 2018). Fossette et al. (2021) reported a peak in nesting for green turtles for the period November and December (refer to Table 4-18).

The peak hatchling emergence time for the three turtle species nesting within Dampier Archipelago differs between species, with hawksbill turtles earliest (December to January peak), flatback turtle peak from January to February and green turtle peak from January to March (PENV, 2022) (refer to Table 4-18).

The distance between turtle nesting beaches and the Operational Area at the closest point (6.6 km to Legendre Island and >10 km to closest nesting beach on Legendre Island and 14 km to Rosemary Island) are all greater than the zone where behavioural impacts from vessel lighting are possible: within 0.7 km of the TSHD and 1.8 km of the PV. Therefore,

impacts to nesting female turtles, including discouraging females from nesting, or affecting nest site selection and sea-finding behaviour, are not predicted, and females are not expected to be displaced from nesting habitat (PENV, 2022).

Disturbance to transient adult turtles in offshore waters along the Trunkline Project Area from artificial light is not expected given light emissions are unlikely to result in behavioural change for key life cycle stages such as internesting and nesting.

Impacts are not expected to be contrary to the priority actions or measures of success criteria outlined in the Recovery Plan for Marine Turtles (Commonwealth of Australia, 2017a) for the relevant marine turtle stocks or management of artificial light.

Marine Turtles – Hatchlings

Turtle hatchlings emerge from the nest and orient towards the sea. After entering the water, hatchlings use a combination of cues (wave direction and currents) to orient and travel into offshore waters. Exposure to artificial light can alter how hatchlings find the sea after emerging from their nests, and how they disperse once they are in the sea (Witherington and Martin, 2003). Impacts to the sea-finding behaviour of hatchlings are more common for light sources behind a beach, as lighting offshore will orient emerging hatchlings towards the sea. At close distances to artificial light, light spill may ‘entrap’ hatchling swimming behaviour, reducing the success of their seaward dispersion and potentially increasing their exposure to predators via silhouetting (Salmon et al., 1992).

As above, the light modelling of a representative PV and TSHD vessel (PENV, 2022) indicates that light levels at the nearest nesting beaches to the Operational Area are below thresholds where behavioural impacts are possible. Therefore, impacts to hatchling emergence, including hatchling mis- or dis-orientation, are not predicted and highly unlikely. Impacts to hatchling dispersal resulting from vessel lighting are possible but will be limited as:

- The distance between turtle nesting beaches and the Operational Area at the closest point (6.6 km to Legendre Island and >10 km to closest nesting beach on Legendre Island and 14 km to Rosemary Island).
- Nearshore currents would need to carry hatchlings into the zone where behavioural impacts from vessel lighting are possible (within 1.8 km of the PV, 0.7 km of the TSHD and 1.2 km for the RIV).
- The density of hatchlings will decrease with distance from the nesting beach as individuals disperse in open ocean.
- Nearshore currents in the region must be weaker than hatchling swimming speed in order for hatchlings to override wave cues and successfully swim toward light sources.
- The potential for attraction to vessel lighting is expected to be overridden by the radiance of the moon during full moon periods.
- Vessels within 20 km of nesting beaches will be in the area temporarily (months) during the Petroleum Activities Program, light emissions will not be ongoing.
- Vessels within the Operational Area will be continuously moving at varying speeds, particularly within the Offshore Borrow Ground Project Area where vessel presence is limited to a few hours at a time.
- Attraction to light sources will not occur during daylight and hatchling dispersal will resume upon sunrise.

Attraction to artificial lighting may have consequences at the individual level (e.g. energy depletion and increased predation risk), however, the number of marine turtles that could be impacted is likely to be low and undetectable against normal population fluctuations. The desktop lighting assessments by PENV (2020a and 2022) concluded that the light emissions from vessel activities in the Trunkline and Borrow Ground Project Area would not have significant impact on marine turtles across the whole life cycle.

Impacts are not expected to be contrary to the priority actions or measures of success criteria outlined in the Recovery Plan for Marine Turtles (Commonwealth of Australia, 2017a) for the relevant marine turtle stocks or management of artificial light.

The magnitude of impact to marine turtles from artificial light emissions will be ‘no lasting effect’ given the localised and temporary nature of any effects as described above. Receptor sensitivity is high. The Impact Significance Level of has therefore been identified as **Slight (E)**.

Seabirds and Migratory Shorebirds

Artificial light can have a variety of effects on seabirds and shorebirds, depending upon the species and the life stage or behaviours being undertaken at the time. Negative responses of birds to artificial light may include collision, entrapment, stranding, grounding, disorientation or interference with navigation (being drawn off course from usual migration route), potentially resulting in reduced fitness, injury and/or death (see Commonwealth of Australia, 2020 for review).

All seabird species active at night are vulnerable to artificial light as it can disrupt their ability to orient towards the sea (Commonwealth of Australia, 2020). Species with a nocturnal component to their behaviour and life history, such as procellariiforms (including wedge-tailed shearwaters), are at greater risk of negative impacts from artificial light sources at night. The bulk of the literature concerning impacts of lighting upon procellariiforms relates to the synchronised mass exodus of fledgling seabirds from their nesting sites (Deppe et al., 2017; Raine et al., 2007; Rodriguez et al., 2017a; Rodriguez et al., 2017b), with fewer investigating the impacts of light at sea.

Diurnal seabird species, such as terns, noddies and boobies, in contrast to procellariiforms, are less vulnerable to impacts resulting from nocturnal behaviours. However, the presence of lit facilities can result in localised alteration of foraging behaviours such as extended foraging durations.

Adult shearwaters are vulnerable to artificial lighting in the breeding cycle, when returning to and leaving the nesting colony to maintain nesting sites or forage. Foraging wedge-tailed shearwaters may be attracted to sources of light emissions to feed on fish drawn to the light, however the species reportedly feeds predominately during the day (Catry et al. 2009). Artificial light can also impact behaviour and adult nest attendance, or confuse shearwater species, resulting in injury or mortality as a result of birds colliding with structures (Cianchetti-Benedetti et al. 2018; Rodriguez et al. 2017a and b). Fledglings of burrow-nesting seabirds, and to a lesser extent adults, are attracted to and then grounded (i.e., forced to land) by lights when they fly at night with the most affected seabirds being petrels and shearwaters (Procellariiformes) (Rodriguez et al. 2017). Shearwater fledglings are predominately impacted by onshore lighting sources, which can override sea finding cues and attract fledglings further inland, preventing them from reaching the sea (Mitkus et al. 2016; Telfer et al., 1987). Fledglings leave the nesting colony for the sea at night and the main fledgling period for shearwaters in Western Australia is reportedly April. Reported mass groundings and mortalities are associated with formerly uninhabited islands and the risk of light pollution from tourism and urban sprawl, and generally occur during adverse weather conditions. This is probably because of the potential for clouds, mist and rain to increase light pollution levels (Kyba et al., 2011), however recent research is revealing added complexity including moon phase, wind strength and direction (see Commonwealth of Australia, 2020 for review).

The Operational Area is in proximity to and overlaps breeding and foraging habitat for a number of seabird species and the nearest KBA for migratory shorebirds is located at the Dampier Saltworks. Onshore nesting habitat, including for the wedge-tailed shearwater, roseate, Caspian and Australian fairy tern, is reported for the Dampier Archipelago and other offshore islands groups such as the Montebellos and Lowendals. Adults utilising these breeding habitats (see BIAs in Table 4-16) will forage in nearshore waters (e.g., the Australian fairy tern) or offshore waters (e.g., wedge-tailed shearwater, Caspian and roseate terns, refer to Section 4.6.4). The Operational Area is located in offshore waters and there is no emergent land available for seabird roosting or nesting. This Operational Area represents a relatively small portion of the seabird BIAs and while seabird presence may occur, it is considered likely to be of a transient nature only.

There is a small overlap between the Operational Area and a breeding BIA for roseate terns between KP 32 to ~KP 58. Breeding populations of this tern species occur throughout the NWMR (overlapping with the EMBA) on fringing islands of the Burrup Peninsula, Montebello Islands, North Turtle Island, Airlie Island, the Ningaloo coast and Bernier Island. There is also an overlap between the Operational Area and a breeding/foraging BIA for wedge-tailed shearwaters between KP 32 to ~KP 220. Wedge-tailed shearwaters occurs throughout the NWMR (overlapping with the EMBA) across fringing islands of the Dampier Archipelago to Cape Range and to Barrow Island. Given the broad breeding distribution it may be assumed that wedge-tailed shearwaters may breed on any of the vegetated, unoccupied islands of the Dampier Archipelago.

The Offshore Borrow Ground Project Area is 6.6 km from the nearest island or other emergent features (Legendre Island) and the Trunkline Project Area is 12 and 14 km from the nearest islands (Legendre and Rosemary Islands, respectively, and within the 20 km nominal distance at which artificial light impacts should be considered (Commonwealth of Australia, 2020).

Light modelling undertaken (Section 7.1.1.1 of the Scarborough OPP) indicated that light emissions were predicted to reduce to ambient levels (0.01, or 1%, radiance of a full moon) at 5.7 km and 4.7 km from the PV and TSHD vessel, respectively. PENV (2022), modelling and desk top assessment confirmed predicted light emissions to reduce to ambient levels (0.01, or 1%, radiance of a full moon) at 5.7 km for the PV, 3.2 km for the TSHD and 5.8 km for the RIV. Therefore, any potential impacts to seabirds and migratory shorebirds are expected to be localised within the vicinity of vessels. It is also highly unlikely that adult nocturnal seabird foraging will be disturbed given the localised light emissions from activity vessels. Potential for overlap of vessel activities, namely trunkline trenching by the TSHD near the State waters boundary, with the wedge-tailed shearwater fledgling exodus from islands of the Dampier Archipelago in April is possible. However, given the localised vessel light emissions predicted and existing light sources in the marine waters of the area, activity vessels continually moving at varying speeds and the expected, generally benign weather conditions in this region, the potential for wedged-tailed shearwater fledglings leaving burrows at night to collide, ground or become disoriented are considered unlikely. The worst-case scenario for cumulative vessel lighting is considered to be during pipelay when the PV is undertaking pipelay operations; a B-Type vessel is either performing resupply alongside the PV or bunkering alongside a tanker under DP; and an OSV under DP is alongside the PV. However, the duration of this activity in proximity to the Dampier Archipelago will be temporary as the vessels progress along the trunkline route further offshore.

Direct lighting impacts to diurnal seabirds on the islands of the Dampier Archipelago are not expected based on the maximum extent of lighting emissions from the modelling (PENV, 2022) and the behaviour of diurnal seabirds as they roost on islands and mainland habitat from dusk to dawn. The potential for temporary behavioural disturbance localised around vessels is not expected to result in a substantial adverse effect on species' population, and light emissions will not seriously disrupt the lifecycle of an ecologically significant proportion any migratory bird species.

The magnitude of impact to seabirds and migratory shorebirds from artificial light emissions will be 'no lasting effect' given the localised and temporary nature of any effects as described above, plus the incremental increase of project vessel lighting in a region that already experiences considerable vessel traffic. Receptor sensitivity is high. The Impact Significance Level has therefore been identified as **Slight (E)**.

Fish

Experiments using light traps have found that some fish and zooplankton species are attracted to light sources (Meekan et al., 2001), and therefore, lighting from project vessels may result in localised aggregations of fish around the vessel. Krill or plankton may also aggregate around the source of light. The concentration of organisms attracted to light may result in an increase in food source for predatory species and marine predators may subsequently aggregate in these areas (Shaw et al., 2002). The Trunkline Project Area overlaps with the whale shark BIA however, potential light disturbance is restricted to vessels during trunkline installation. Presence of other threatened fish species within the Operational Area or pipeline route is expected to be of a transient nature only. Vessels undertaking trunkline installation activities will be continuously moving and present for short periods only, and are not expected to seriously disrupt the lifecycle of an ecologically significant proportion of whale sharks. Additionally, light emissions from project vessels are comparable to other activities in the region (e.g. shipping, fishing).

The magnitude of impact to fish from artificial light emissions will be 'no lasting effect' and receptor sensitivity is medium. The Impact Significance Level of has therefore been identified as **Negligible (F)**.

AMPs

The Operational Area overlaps the Montebello Marine Park, and the Dampier Marine Park is less than 1 km from the Borrow Ground Project Area. The North-west Marine Parks Network Management Plan (DNP, 2018a) lists the natural values of the Montebello and Dampier AMPs as including a range of threatened, migratory, marine or cetacean species listed under the EPBC Act, as well as BIAs that include seasonal breeding habitat for seabirds, internesting habitat for marine turtles and a migratory pathway for humpback whales. The Montebello AMP also includes foraging, mating, and nesting habitat for marine turtles and foraging habitat for whale sharks, while the Dampier AMP includes foraging habitat for seabirds. The Montebello Marine Park and Dampier Marine Park are overlapped by internesting buffer Habitat Critical to the survival of flatback, green and hawksbill turtles. As described above, there is no evidence, published or anecdotal, to suggest that internesting, mating, foraging or migrating turtles are impacted by light from offshore vessels. Although individuals undertaking internesting, migration, mating (adults) or foraging (adults and pelagic juveniles) may occur within the Operational Area, marine turtles do not use light cues to guide these behaviours, and therefore light emissions from project vessels are unlikely to result in displacement of, or behavioural changes to individuals during these life stages. Hence, light emissions from project vessels in the areas where the Operational Area overlaps these AMPs will not result in any impacts to internesting female turtles.

The three seabird species with BIAs overlapping the Operational Area, occupy offshore islands including the Montebello Island groups and the Dampier Archipelago. For activities occurring within the Montebello Marine Park, and adjacent to the Dampier Marine Park, the short-term and transient nature of activities associated with light emissions will not be inconsistent with the objectives of the management plan for the North-west Marine Park Network (DNP, 2018a).

The values identified for both these marine parks including BIAs for marine turtles, seabirds and migratory shorebirds will not be impacted given the significant distance from sensitive locations. Therefore, no impacts are expected to the cultural values of the AMP as those are intrinsically linked to the natural values described above.

The magnitude of impact to AMPs from artificial light emissions will be 'no lasting effect' given the localised and temporary nature of any effects as described above. Receptor sensitivity is high based on important habitat for marine turtles and seabirds that are sensitive to lighting impacts. The Impact Significance Level has therefore been identified as **Slight (E)**.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity Level	Magnitude	Impact Significance Level
Ambient Light	Change in ambient light	Low value (open water)	Slight	Negligible (F)
Marine Reptiles	Change in fauna behaviour	High value species (e.g. flatback turtle)	No Lasting Effect	Slight (E)
Seabirds and Migratory Shorebirds		High value species (e.g. wedge-tailed shearwater)	No Lasting Effect	Slight (E)
AMPs	Change in fauna behaviour	High value species	No Lasting Effect	Slight (E)

Overall Impact Significance Level: The overall impact significance level for routine light emissions is E based on slight, short-term impacts to the high value (marine turtles, seabirds and migratory shorebirds). The impact significance levels for individual receptors are consistent with the levels rated in the Scarborough OPP.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation, Codes and Standards				
No additional controls identified.				
Good Practice				
Lighting will be limited to the minimum required for navigational and safety requirements, with the exception of emergency events.	F: Yes. Lighting is typically appropriate for navigation and safety. CS: Minimal cost sacrifice – usual mode of operation.	Given the potential impacts to turtles during this activity is insignificant, implementation of this control would not result in a reduction in consequence.	Benefits outweigh cost / sacrifice	Yes C 4.1
Lighting modifications (shielding, directional lighting) to minimise over water light spill and light emissions during peak turtle hatchling season (Dec to Mar).	F: Yes, lighting is able to be modified on the PV and TSHD. CS: Financial cost of changes and time associated with implementing these.	Reducing light spill over water and overall light glow from a vessel can reduce the likelihood that hatchling behaviour will be influenced. Light modelling of a representative PV and TSHD has predicted that light emissions will reduce to ambient levels at 5.7 km and 3.2 km, respectively, and hence will not be at levels likely to impact turtle behaviour at nesting beaches.	Cost/sacrifice outweighs benefit. Due to the distance of key activities (pipelay and dredging) from turtle nesting beaches (>10 km, and the temporary / transient nature of this activity; benefits in implementing this control are expected to be minimal.	No
PV, RIV and TSHD crew will be trained in light reduction measures when operating within 20 km of Islands between December and April ²⁶ .	F: Yes. CS: Minimal cost/sacrifice.	Reducing overall light emissions from the vessel can reduce light glow and potentially lower the area over which vessel lighting may impact turtle behaviour. Given distance of the Operational Area from known turtle nesting beaches, a reduction in consequence from implementation of this control is not expected.	While the control does not result in significant reduction of potential impacts, it is good practice to raise awareness.	Yes C 4.2

²⁶ Peak turtle hatchling emergence period is December to March, with the wedge-tailed shearwater fledglings emergence in April.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Implement a Seabird Management Plan that includes: <ul style="list-style-type: none"> Standardisation and maintenance of record keeping and reporting of seabird interactions Procedures on seabird intervention, care and management Regulatory reporting requirements for seabirds (unintentional death of or injury to seabirds that constitute MNES) A scalable adaptive management process should negative light impacts to nocturnal seabirds be detected 	F: Yes. CS: Minimal cost/sacrifice.	Implementing a Seabird Management Plan will enable standardised data collection to better understand seabird interactions with project vessels, provide guidance on seabird management to enable the best outcomes for grounded birds and facilitate escalation and adoption of management actions within 24 hrs, preferably before next nightfall, should triggers be met.	While the control does not result in significant reduction of impacts, it is good practice and not at significant cost.	Yes C 4.3
Professional Judgement - Eliminate				
Variation of the timing of the Petroleum Activities Program within 20 km of turtle nesting beaches to avoid peak turtle hatchling emergence periods (Dec to Mar).	F: Yes. It is possible to avoid peak turtle hatchling emergence periods, through scheduling. CS: Significant cost and schedule impacts due to delays in securing vessels for specific timeframes. The Petroleum Activities Program is due to be undertaken over approx. 12 months with activities completed at various times throughout the year. To avoid peak turtle hatchling emergence periods would result in significant delays to the project.	Avoiding peak hatchling emergence periods may reduce light attraction of hatchlings. Impacts to hatchling dispersal resulting from vessel lighting are possible but will be limited by the distance of the Operational Area from the turtle nesting beaches and the temporary nature of the Petroleum Activities Program. Implementation of this control would not result in a reduction in consequence due to the distance of the Operational Areas from turtle nesting beaches and the small area impacted by vessel light glow.	The cost/sacrifice outweighs benefit gained.	No
Loading of supplies which require direction of floodlights outside vessel will not occur	F: Yes. It is possible to restrict loading from	Avoiding vessel transfer activities at night within 20 km	The cost/sacrifice outweighs benefit gained.	No

objections and claims at this time and in recent engagement MAC has confirmed they have no concerns at this time.

Acceptability Statement:

The impact assessment has determined that, given the adopted controls, routine light emissions from external lighting on the project vessels is unlikely to result in an impact significance level greater than slight. BIAs for 20 EPBC Act listed Threatened or Migratory species overlap the Operational Area or EMBA. Regard has been given to relevant conservation advice and wildlife conservation plans during the assessment of potential impacts and the NLPG were taken into consideration during the impact evaluation. The Petroleum Activities Program is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice (Section 6.9.2).

Demonstration of acceptability for the sources of aspect and associated impacts assessed in this section are provided in Section 7.1.1.3 of the Scarborough OPP (SA0006AF0000002, rev 5) and the Demonstration of Acceptability (above) aligns with this. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of light emissions to a level that is broadly acceptable.

Internal combustion engines and incinerators on vessels				✓				A	F	-	-	LCS GP PJ	Broadly Acceptable	EPO 13, 14
Description of Source of Impact/Risk														
<p>Atmospheric emissions refer to the discharges to the atmosphere of gases and particulates from an activity, or from a facility or piece of machinery, which have a recognised adverse effect on human health and/or flora and fauna. The main emissions responsible for these effects include carbon monoxide (CO), oxides of nitrogen (NO_x), sulphur dioxide (SO₂), particulate matter less than 10 microns (PM₁₀), non-methane volatile organic compounds (VOCs), BTEX (benzene, toluene, ethylbenzene and xylenes), which are specific VOCs of interest.</p> <p>Greenhouse gas (GHG) emissions are defined as those gases within the atmosphere that absorb long-wave radiation, and thus trap heat reflected from the Earth's surface. The main gases responsible for this effect include carbon dioxide (CO₂), methane (CH₄) and nitrous oxide (N₂O). Other greenhouse gases include perfluorocarbons (PFCs), hydrofluorocarbons (HFCs) and sulphur hexafluoride (SF₆).</p> <p>Vessels are powered via the use of on-board generators (diesel-powered and/or LNG). Vessel operations require the use of marine diesel to undertake daily activities functions such as crane movements, desalination, sewage treatment, etc. Atmospheric emissions will be generated by the project vessels from internal combustion engines (including all equipment and generators) and incineration activities (including onboard incinerators).</p> <p>Vessel use within the Operational Area closer to shore where townships are present is limited to the works along the trunkline route and the cycling of dredging and backfill between the Offshore Borrow Ground Project Area, Trunkline Project Area and disposal of material in Spoil Ground 5A. Works of this nature closer to shore will be conducted over a period of months (Section 3.6) and vessels will be continually moving. Vessel use will extend offshore within the Trunkline Project Area to a distance of approximately 375 km from the shore.</p> <p>Atmospheric emissions generated during the Petroleum Activities Program will include SO_x, NO_x, particulates and Volatile Organic Compounds (VOCs). SO_x and particulate matter emissions are heavily influenced by the fuel used and its relative sulphur content, MGO having a lower sulphite content than marine diesel oil or heavy fuel oil (HFO).</p> <p>Greenhouse gases will be emitted from vessels involved in the activity consuming marine diesel fuel, and by helicopters transferring personnel. Using vessel fuel consumption rates estimated by contractors, internal helicopter fuel consumption data and emission factors from the National Greenhouse and Energy Reporting Scheme (NGERS), GHG emissions have been estimated and are presented below according to the broad project phases described in section 3:</p>

- Pre-Lay Seabed Intervention: 25,000 tCO₂e
- Trunkline Installation: 130,000 tCO₂e
- Post-Lay Seabed Intervention: 30,000 tCO₂e

Total GHG emissions for the whole activity are expected to be approximately 185,000 tCO₂e.

These figures are estimates only. The actual consumption of fuel varies based on factors such as the nature of activity being undertaken by vessels, metocean conditions etc. While Woodside may influence via contracting approaches, in-field day to day operations, and therefore fuel consumption, are under the control of vessel masters.

Detailed Impact Assessment

Assessment of Potential Impacts

Routine atmospheric and greenhouse gas emissions from vessel operations has the potential to result in the following impact(s):

- change in air quality

As a result of a change in air quality, further impacts may occur, which include:

- injury and/or mortality to fauna
- climate change
- change in aesthetic value.

Air Quality

Atmospheric and greenhouse gas emissions from the Petroleum Activities Program may result in a decline in local air quality, within the immediate vicinity of the emissions source. As described above, produced emissions throughout the project will include SO₂, NO_x, ozone depleting substances, CO₂, particulates and VOCs. Emissions from engines, generators and deck equipment may be toxic, odoriferous or aesthetically displeasing, and will result in a reduction in air quality.

The air quality within the Operational Area is typical of an unpolluted tropical offshore environment and the ambient air quality in the offshore NWMR will be of high quality. Atmospheric emissions from the fuel combustion and incineration on project vessels (including generation of dark smoke) have the potential to result in a localised reduction in air quality in the immediate vicinity of the release point, with no lasting effect.

Although the Offshore Borrow Ground Project Area and part of the Trunkline Project Area are located closer to the shore, they remain in open ocean and well-removed from nearest residential or sensitive populations of the WA coast. Given the short duration and exposed location of project vessels, low volumes of atmospheric emissions will be rapidly dispersed, therefore biodiversity, ecological integrity, social amenities and human health will not be impacted.

Marine Fauna

Atmospheric emissions can cause direct impacts to fauna if they are present in the immediate vicinity of significant releases. Birds, for example, have been shown to suffer respiratory distress and illness when subjected to extended duration exposure to air pollutants (Sanderfoot and Holloway, 2017). Given that atmospheric emissions from project vessels will be transient and temporary, and that fauna numbers will be low at the point of discharge, injury or mortality to fauna a result of atmospheric discharges is considered negligible and has not been evaluated further.

Climate Change

GHG emissions generated by vessels contribute to global concentrations of GHG emissions. Cumulative increases in net global atmospheric GHG concentrations are considered to contribute to climate change. Climate change impacts cannot be directly attributed to any one activity, as they are instead the result of global GHG emissions, minus global GHG sinks, that have accumulated in the atmosphere since the industrial revolution.

The impact assessment of the Scarborough Project, including the contribution to global GHG emissions and the potential impacts of climate change on sensitive receptors, within Australian jurisdictions is described in Section 7.1.3.8 of the Scarborough OPP (SA0006AF0000002, rev 5). More recent climate change reports have been published with updated projections of climate change, including the IPCC's Sixth Assessment Report (AR6) and the CSIRO and Bureau of Meteorology's State of the Climate 2020, which outlines the projected changes to Australia's climate. AR6 projects a slight increase in warming for similar emissions scenarios to AR5 (as presented in the Scarborough OPP), with a narrower range of uncertainty of these projections (higher confidence rates). The slight increase in warming is a result of a range of factors including the higher estimate of historical warming in AR6 and updated estimates of climate sensitivity (IPCC, 2020). The impact or risk evaluation described in Section 7.1.3.8 of the OPP does not change. Other construction, installation and decommissioning GHG emissions will be addressed in relevant EP for those activities.

Aesthetic Value

Atmospheric emissions have the potential to introduce odour and visual amenity issues which can result in changes to the aesthetic value of an area. Scarborough is located in the open ocean and is well-removed from nearest residential or sensitive populations of the WA coast, with limited interaction with the regional airshed. Although the Offshore Borrow Ground Project Area and part of the Trunkline Project Area are located closer to the shore, they remain in open ocean

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

and the potential for a change in air quality from atmospheric emissions associated with Scarborough resulting in a change to aesthetic value for tourism/recreation or settlements is not considered to be credible.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity Level	Magnitude	Impact Significance Level / Risk Consequence
Air Quality	Change in air quality	Low value (open water)	Slight	Negligible (F)
	Climate Change	Low value	Slight	Negligible (F)

Overall Impact Significance Level: The overall impact significance level for routine atmospheric and GHG emissions is negligible (F) based on a slight effect on air quality. The impact significance levels for individual receptors are consistent with the levels rated in the Scarborough OPP.

Demonstration of ALARP

Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation, Codes and Standards				
Vessel compliance with Marine Order 97 (Marine pollution prevention – Air pollution) including: <ul style="list-style-type: none"> International Air Pollution Prevention (IAPP) Certificate, required by vessel class Use of low sulphur fuel when available Ship Energy Efficiency Management Plan (SEEMP), where required by vessel class Onboard incinerator to comply with Marine Order 97. 	F: Yes. CS: Minimal cost. Standard practice	Legislative requirements to be followed may slightly reduce the likelihood of air pollution.	Control based on legislative requirements – must be adopted.	Yes C 5.1
Reporting of GHG emissions as required by regulatory requirements	F: Yes. CS: Minimal cost. Standard practice	Emissions reporting can increase transparency and accountability	Control based on regulatory requirements – must be adopted.	Yes C 5.2
Good Practice				
Vessel operations planned such that fuel consumption and therefore subsequent emissions are minimised. Examples may include such aspects as vessel speeds, cleaning of biofouling, preventative maintenance on equipment such as thrusters, or turning off equipment when not in use.	F: Yes CS: Schedule delays	Managing use of project vessels can reduce fuel usage and subsequent GHG / air emissions	Potential benefit outweighs cost/sacrifice.	Yes C 5.3

Description of Source of Impact/Risk																
The Petroleum Activities Program may not be executed as a single campaign or in a consecutive sequence, therefore acoustic emissions may occur within the Trunkline Project Area at any time during the period of the EP. Figure 6-1 shows likely sequencing of seabed intervention and trunkline installation activities and where these will occur along the Trunkline route over time. This has been used to inform the worst-case credible noise propagation scenario for modelling as well as cumulative impact assessment as a result of concurrent operations, discussed below.

Geophysical and Geotechnical Pre-lay Survey Activities

The noise emitted during geotechnical survey activities is generated by a combination of the geotechnical equipment (sampling and in situ testing operations) and the survey vessel (described below).

Geophysical and geotechnical survey activities may occur within the Trunkline Project Area and Borrow Ground Project Area. Geophysical sources will be used for bathymetric mapping and shallow sub-bottom profiling, penetrating to depths of about 20 m below the seabed. A range of geophysical sources will emit pulses (impulsive noise) with frequency outputs ranging from 10 Hz (low end of refraction system) to 900 kHz (side scan sonar).

The survey methods may include:

- multibeam echo sounders (MBES)
- side scan sonar (SSS)
- pipe trackers
- magneto meter and sub bottom profiler (SBP)

Sound pressure levels (SPL) for MBES typically range from 210 to 245 dB re 1 μ Pa @ 1 m, and SSS typically range from 200–235 dB re 1 μ Pa SPL (Jimenez-Arranz et al., 2020). The frequencies range from about 75 to 900 kHz (Jimenez-Arranz et al., 2020).

Underwater Positioning Equipment

An array of long baseline (LBL) and/or ultra-short baseline (USBL) transponders may be installed on the seabed for positioning of mattresses, rock berms or structures on the seabed.

Transponders typically emit pulses (impulsive noise) of medium frequency sound, generally within the range 21 to 31 kHz. The estimated SPL would be 180 to 206 dB re 1 μ Pa at 1 m (Jiménez-Arranz et al., 2020). Transmissions are not continuous but consist of short ‘chirps’ with a duration that ranges from 3 to 40 milliseconds. Transponders will not emit any sound when on standby, and when required for precise positioning they will emit one chirp every five seconds (estimated to be required for four hours at a time).

Vessel Operations

Vessels used for the Petroleum Activities Program are detailed in Section 3. The sound levels and frequencies generated by vessels varies with the size of the vessel, speed, engine type and the activity being undertaken. Large vessels typically produce higher sound levels at lower frequencies than small vessels, although significant variation may be found among vessels within the same group (Jiménez-Arranz et al., 2020). Sound levels tend to be greatest when engaging the throttle or thrusters, such as use of DP or when vessels are operating under load, compared with slow moving or idling vessels (Salgado Kent et al. 2016).

The greatest sound levels are likely to be associated with vessels using DP thrusters to maintain position on station. For example, the TSHD, deepwater PV and OCV will operate on DP and support and supply vessels may also engage thrusters when working alongside.

McCauley (1998) measured underwater broadband noise equivalent to approximately 182 dB re 1 μ Pa at 1 m (rms SPL) from a support vessel holding station using DP in the Timor Sea; it is expected that similar noise levels will be generated by vessels used for this Petroleum Activities Program. Similarly, Hannay et al. (2004) and McCauley (2005) have measured source level for support vessel with DP of 186 dB re 1 μ Pa at 1 m (Table 6-10).

Pipelay vessels operating DP have been reported to have source levels between approximately 168 and 187 dB re 1 μ Pa at 1 m (SPL) (Nedwell and Edwards, 2004; MacGillivray and Racca, 2006; Johansson and Andersson, 2012; Jiménez-Arranz et al., 2020). Acoustic emissions from the PV *Castorone*, which will be used for the Petroleum Activities Program has been estimated to have a source level of 192 dB 1 μ Pa based on measurements from a similar surrogate PV (Zykov et al., 2013).

Source levels for the OCV *Boka Falcon* are expected to be similar to the *Skandi Hercules*, which was modelled for Woodside in 2021 (Quijano and McPherson, 2021). Source levels were estimated to be 181 dB 1 μ Pa (SPL).

Excluding DP, vessels produce low frequency sound (i.e. below 1 kHz) from the operation of machinery, hydrodynamic flow sound around the hull and from propeller cavitation.

Seabed Intervention and Pipelay

TSHD

In addition to acoustic emissions from DP, TSHD activities will generate sound from sediment excavation and placement of the dredged material at the disposal site (Figure 6-4). However, sources of acoustic emissions are most likely to be associated with cavitation noise from TSHD propellers and bow thrusters (de Jong et al., 2010), rather than other sources associated with TSHD (drag head).

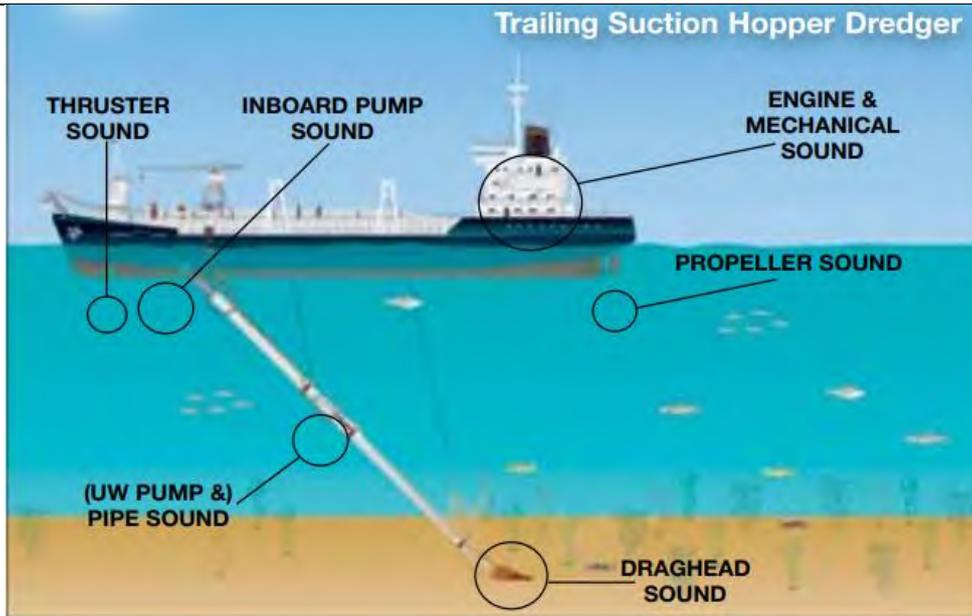

Figure 6-4: Sound sources for TSHD (WODA, 2013)

Acoustic emissions produced by TSHDs has been measured on a number of occasions, as documented in CEDA (2011). Robinson et al. (2011) measured six TSHDs, stating that sound levels below 500 Hz were in line with those expected for a cargo ship travelling at modest speeds (8 –16 knots). The maximum broadband source sound pressure level (SPL) was 189.9 dB re 1 μ Pa at 1 m (calculated based on 1/3 octave band levels from 31.6 Hz to 39.8 kHz, (Robinson et al., 2011) (Table 6-10). De Jong et al. (2010) measured underwater sounds produced by seven TSHDs. Results showed that dredging itself did not produce louder sounds than those produced by the dredger during transit between the dredging and placement sites (Figure 6-5). The TSHDs had an estimated maximum SPL around 184 – 188 dB re 1 μ Pa² m² (main energy between 100 and 500 Hz).

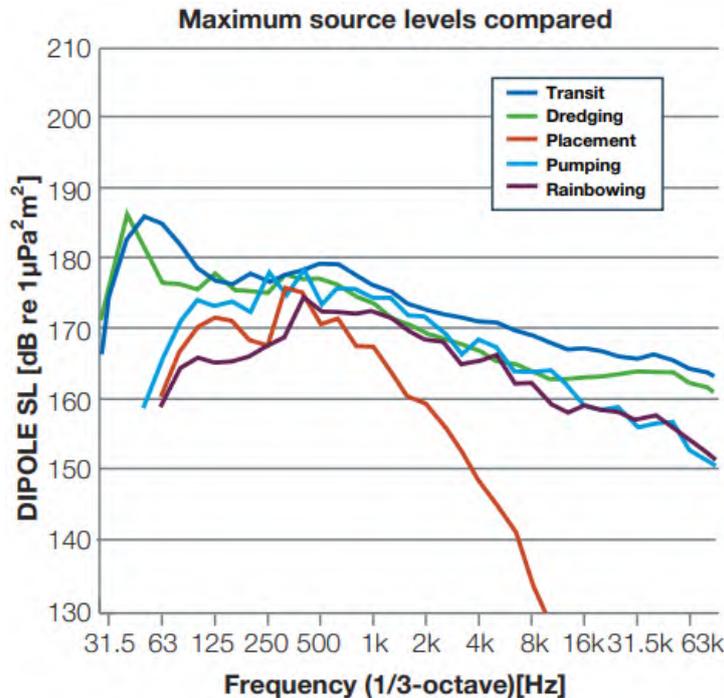

Figure 6-5: Comparison of the upper envelope of the measured dipole source level spectra for seven TSHDs, while transiting, dredging, placement, pumping and rainbowing (de Jong et al. 2010, cited in WODA, 2013)

Slope Crossing Seabed Preparation

A construction vessel, equipped with an ROV controlled heavy duty grab, is planned to be used for slope crossing seabed preparation. The noise produced by grab excavation vary substantially with operational stage. Dickerson et al. (2001) measured SPLs at 0.15 km from a grab dredger. The loudest SPLs of 124 dB re 1 µPa were recorded at peak frequencies of 0.16 kHz, when the bucket made impact with the seabed. However, sound levels during this operation will be highly dependent on the material dredged (sand as opposed to gravel) (Robinson et al., 2011). Another investigation carried out on grab dredgers indicates that the activity is relatively quiet and recorded sound levels were just above the background sound at approximately 1 km from the source (Clarke et al., 2002).

Secondary options to achieve the excavation profile are methods such as mass flow excavation, conventional ROV dredging tooling and/or jetting to create the required trench. Acoustic emissions generated from these activities are expected to be similar to the ROV grab or TSHD described above.

Pipelay and Rock Placement

During installation of the trunkline using the deepwater PV, pipelaying is unlikely to have a noticeable contribution to the sound field as the largest contribution comes instead from the vessel DP, supply vessels and tugs (Johanson and Andersson 2012; Jiménez-Arranz et al., 2020). Similarly, when comparing the sound levels produced during rock placement and normal operations by a pipelay vessel there was no noticeable increase in noise, which again suggests that sound levels are dominated by vessel noise (Nedwell and Edwards 2004; Jiménez-Arranz et al., 2020).

A SWLB may operate for a short distance into Commonwealth waters before handover to the PV. Anchored pipe-laying barges, such as the SWLB, generate lower sound levels than the anchor handling tugs and support vessels that assist them. For example, pipelay barges have source levels between approximately 166 and 181 dB re 1 µPa at 1 m (SPL) (Hannay et al. 2004; MacGillivray and Racca 2006), whereas anchor handling tugs (AHTs) working with the barges have measured source levels ranging between approximately 164 to 190 dB re 1 µPa at 1 m (SPL) depending upon vessel size and power (Hannay et al. 2004; Jiménez-Arranz et al. 2020). It is noted that these AHT levels include a 72 m long AHT which is larger and more powerful than the AHTs that will be used for the Petroleum Activities Program.

Helicopter Operations

Helicopter noise is emitted to the atmosphere during routine helicopter flights to support operations (Section 3.8.2). Sound emitted from helicopter operations is typically below 500 Hz (Richardson et al., 1985). Richardson et al. (1995) reports that helicopter sound is audible in air for four minutes before it passed over underwater hydrophones, but detectable underwater for only 38 seconds at 3 m depth and 11 seconds at 18 m depth. Noise levels reported for a Bell 212 helicopter during fly-over was reported at 162 dB re 1 µPa and for Sikorsky-61 is 108 dB re 1 µPa at 305 m (Simmonds et al., 2004).

Table 6-10: Sources of aspect, and the operating frequency and noise levels

Source of aspect	Operating frequency (kHz)	Source Level (@1 m)		Sound category	Reference
		SPL (L _p)	PK (L _{pk})		
Pre-lay surveys	0.07-9	210-245	-	Impulsive	Jimenez-Arranz et al. (2020)
TSHD	0.3-20	186 -188	-	Continuous	Thomsen et al. (2009) Robinson et al. (2011) CEDA (2011) WODA (2013)
Positioning equipment	21-31	180-206	-	Impulsive	Jimenez-Arranz et al. (2020)
Vessel operations (DP)	0.2-1	181-186	-	Continuous	McCauley (1998, 2005) Hannay (2004) Quijano and McPherson (2021)
Helicopter operations	0.5	162	-	Continuous	Simmonds et al. (2004)

Cumulative Noise Sources

Vessels associated with pre-lay and post-lay seabed intervention, pipelay and ancillary activities are identified in Section 3.7. Several vessels may be operating concurrently, as identified in Section 6.2.1. Figure 6-1 shows seabed intervention activities are planned to be performed with single vessels, due to short activity durations and vessel mobility for refuelling / supplies etc. The Trunkline installation scope is the only part of the Petroleum Activities Program that will routinely have multiple vessels operating concurrently. It is for this reason that the worst-case scenario for cumulative vessel noise is considered to be during pipelay throughout the Trunkline Project Area when the PV is undertaking pipelay operations; a B-Type vessel is performing resupply alongside the PV; and an Offshore Supply Vessel (OSV) under DP is also alongside the PV. A number of scenarios were modelled for these sources in combination to inform the impact assessment. The modelling is described below.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

This worst-case scenario for cumulative vessel noise associated with Trunkline installation does not include the PV refuelling vessel nor an additional OCV which might be present in some sections to assist with touchdown monitoring. This is because, given the OCV will follow behind the PV at a distance of 2.5 – 3.5 km, the cumulative contribution of this additional vessel will be very small and the extent of predicted impacts (i.e. behavioural disturbance) is expected to only change fractionally from the modelled results of the normal pipelay vessel spread. The PV refuelling vessel is not included as this is typically not a DP vessel.

Figure 6.1 shows there may be concurrent operations between Trunkline installation scopes; namely the PLET foundation installation and Trunkline installation. In this case a construction vessel (or similar) could be present around KP 433 in permit area WA-61-L at the same time as the PV spread (including pipe supply vessel and general supply vessel).

Concurrent operations may also occur between activities in this Petroleum Activities Program and the Scarborough Drilling and Completions campaign. As shown in Figure 6.1 this would be in WA-61-L and consist of a DP MODU and supply vessel (refuelling / bunkering also occurs from the supply vessel). A x-mas tree installation vessel may also be present during the D&C program (if x-mas trees are not installed from the MODU); however, the vessel and MODU cannot be over the same well at the same time, and the vessel is only present for a short period of time (x-mas tree installation usually takes less than one day per well). For these reasons, the x-mas tree installation vessel has been assessed separately and is not expected to contribute to cumulative impact(s).

Cumulative noise sources from concurrent vessel operations can be summarized as shown in Table 6-11.

Table 6-11: Concurrent activities contributing to cumulative underwater vessel noise

Concurrent Activities	Approx. Timing & Location	Vessels
Pre-lay survey & Drilling & Completions*	Approx. Sep 2023 ~ 4 days** PLET ~KP 433	Survey vessel DP MODU + supply vessel
PLET foundation installation & Trunkline Installation & Drilling and Completions*	April 2024 – 2 weeks PLET ~KP 433	Construction vessel DP Pipelay Vessel + pipe supply vessel + support vessel DP MODU + supply vessel
Pre-commissioning & Drilling and Completions*	April / May 2024 – 1 – 3 months depending on pre-commissioning methodology dry vs. wet PLET ~KP 433	Construction vessel DP MODU + supply vessel
Post-lay survey & Drilling and Completions*	Approx. June 2024 ~ 4 days** PLET ~KP 433	Survey vessel DP MODU + supply vessel

*Drilling & Completions activities covered under the Scarborough Drilling and Completions Environment Plan.

**Duration of concurrent activities overlap only, not indicative of timing of the whole activity

Detailed Impact Assessment

Assessment of Potential Impacts

Routine acoustic emissions from the sources described above have the potential to result in the following impact(s):

- a change in ambient noise
- a change in fauna behaviour
- injury and/or mortality to fauna.
- changes to the functions, interest or activities of other users.

Potential Impact of Noise

Elevated underwater noise can affect marine fauna, including cetaceans, marine turtles, fish, sharks and rays, in three main ways (Richardson et al., 1995; Simmonds et al., 2004):

- by causing direct physical effects on hearing or other organs. Hearing loss may be temporary (temporary threshold shift [TTS]; referred to as auditory fatigue), or permanent threshold shift (PTS; injury)
- by masking or interfering with other biologically important sounds (including vocal communication, echolocation, signals and sounds produced by predators or prey)
- through disturbance leading to behavioural changes or displacement from important areas (e.g. BIAs). The occurrence and intensity of disturbance is highly variable and depends on a range of factors relating to the animal and situation.

The extent of the impacts of underwater noise on marine fauna will depend upon the frequency range and intensity of the noise produced, and the type of acoustic signal.

Sound Propagation

Increasing the distance from the noise source results in the level of noise reducing, due primarily to the spreading of the sound energy with distance. The way that the noise spreads (geometrical divergence) will depend upon several factors such as water column depth, pressure, temperature gradients, and salinity, as well as surface and bottom conditions.

Ambient Noise

Ambient noise levels in the Operational Area may be elevated during the Petroleum Activities Program. Underwater noise surveys in the region detected marine fauna vocalisations and anthropogenic sources including vessel noise; seismic survey signals; mooring noise artefacts (McCauley, 2011). Although ambient noise levels in the Operational Area have not been recorded, they are expected to be similar to published ambient noise levels. The Operational Area (Trunkline Route KP 32 to KP 50 and Offshore Borrow Ground) closer to shore where the TSHD vessel will be used are in proximity to existing ports, and a small portion of the Trunkline Project Area also overlaps the Pilbara Port Authority Management Area. These areas are already anticipated to receive anthropogenic sources of noise. Therefore routine acoustic emissions will result in a small incremental increase in ambient noise with no lasting effect.

Acoustic Modelling

To assess the potential magnitude and extent of impacts from underwater noise produced during the Petroleum Activities Program, Woodside commissioned JASCO Applied Sciences (JASCO) to model sound propagation for a range of vessel scenarios during pipelay activities. This modelling study (Connell et al., 2022) considered specific components of the Petroleum Activities Program for representative scenarios within the pygmy blue whale (PBW) migration BIA. Three types of vessels were identified and used to model four sources: the PV undertaking pipelay operations; a B-Type vessel either performing resupply alongside the PV or bunkering alongside a tanker under DP; and an Offshore Supply Vessel (OSV) under DP alongside the PV. These four activities are considered in different combinations for a total of twelve scenarios, including step away scenarios where the B-Type bunkering location was progressively moved farther from the other vessels.

These scenarios were chosen as credible worst case for underwater noise propagation due to the PV vessel spread being the largest of the Petroleum Activities Program as well as the DP pipelay vessel being the largest single vessel with the most significant thruster configuration. As shown in Figure 6-1, other activities in the Petroleum Activities Program are planned to involve only a single vessel, which would be of smaller size than the DP pipelay vessel (PV).

The modelling study specifically assessed distances from operations where underwater sound levels reached thresholds corresponding to behavioural response, impairment (TTS) and injury (PTS). The animals considered here included low-frequency (LF), high-frequency (HF), and very high-frequency (VHF) cetaceans, turtles, and fish including fish larvae and eggs.

The modelling methodology considered the source levels of the individual thrusters for the PV, B-Type, and OSV, as well as environmental properties that effect sound propagation. Estimated underwater acoustic levels are presented as sound pressure levels (SPL), and accumulated sound exposure levels (SEL) as appropriate for non-impulsive (continuous) noise sources. In this study, the duration of the SEL accumulation was defined as integrated over a 24-hour period.

The four activities are considered in different combinations along the pipelay track across the PBW migration BIA, for a total of twelve scenarios, six of which were also considered with animat modelling. Five of these scenarios are the B-Type vessel bunkering in isolation at increasing distances (“stepped away”) from the PV. These five scenarios are added to normal operations with the PV to determine any overlap with marine mammal noise effect thresholds.

Animal movement and exposure modelling (ANIMAT modelling)

In addition to the acoustic modelling outlined above, Woodside commissioned JASCO to also perform an acoustic exposure analysis study for PBW within the migration BIA to investigate any potential effects on PBW migration from the Petroleum Activities Program, using the JASCO Animal Simulation Model Including Noise Exposure (JASMINE) (refer Appendix K)

Sound exposure distribution estimates were determined by moving large numbers of simulated animals (animats) through a modelled time-evolving sound field, computed using the predicted sound source levels and sound propagation modelling outputs. This approach provides the most realistic prediction of the maximum expected root-mean-square SPL and the temporal accumulation of SEL that are considered the most relevant sound metrics for impact assessment. For the moving receivers (the animats) were set to simulate the real-world movements of migrating pygmy blue whales in a southbound direction. Animal movement modelling was considered for the subset of acoustic modelling scenarios

that included “normal operations” (PV, B-type, and OSV under DP) and B-type bunkering at various step away distances. The distribution of distances of animats predicted to be exposed to sound levels above threshold was used to calculate the 95th percentile exposure range (ER_{95%}), and noise effect metrics included SEL_{24h} and SPL (Connell et al., 2022) (refer Appendix K)

Marine Mammals/Cetaceans

Twelve cetacean species may be present within the Operational Area, including LF cetaceans such as humpback whales and pygmy blue whales, and HF cetaceans including Indo-Pacific and spotted bottlenose dolphins (Section 4.6.3). The following species have BIAs (Section 4.6.3 and Figure 4-12, Figure 4-13) that intercept the Operational Area:

- Pygmy blue whale - migration BIA occurs in deeper waters of the Trunkline Project Area.
- Humpback whale - migration BIA occurs in the nearshore waters of Trunkline Project Area and the Offshore Borrow Ground Project Area.

The distribution range to the west of the pygmy blue whale migration BIA is also considered in the potential noise emissions impacts.

Species Sensitivity and Thresholds

Marine mammals and especially cetaceans rely on sound for important life functions including individual recognition, socialising, detecting predators and prey, navigation and reproduction (Weilgart, 2007; Erbe et al., 2015; Erbe et al., 2018). Underwater noise can affect marine mammals in various ways including interfering with communication (masking), behavioural changes, a shift in the hearing threshold; permanent threshold shift (PTS) and temporary threshold shift (TTS), physical damage and stress (NRC, 2003; Erbe, 2012; Rolland et al., 2012). There is little information available regarding call masking in whales (Richardson et al., 1995), although it has been suggested that an observed lengthening of calls in response to low-frequency noise in humpback whales and orcas may be a response to auditory masking (Fristrup et al., 2003; Foote et al., 2004). Exposure to intense impulsive noise may be more hazardous to hearing than continuous noise.

The thresholds that could result in a behavioural response, TTS and PTS for cetaceans as a result of impulsive and continuous noise sources are outlined in Table 6-12. These thresholds have been adopted by the United States National Oceanic and Atmospheric Administration (NOAA) (National Marine Fisheries Service [NMFS], 2014, 2018; Southall et al., 2019; NOAA, 2019). The adopted thresholds are based on best data available and published in peer-reviewed literature and represent conservative internationally accepted and applied impact evaluation thresholds for impulsive and continuous (non-impulsive sound sources).

It is important to note that for non-impulsive sound sources the defined thresholds are as follows:

- Frequency-weighted accumulated sound exposure levels (SEL; L_{E,24h}) from Southall et al. (2019) for the onset of permanent threshold shift (PTS) - 199 (LF cetaceans) and 198 (HF cetaceans) SEL_{24h} (dB re 1 µPa².s) and temporary threshold shift (TTS) – 179 (LF cetaceans) and 178 (HF cetaceans) SEL_{24h} (dB re 1 µPa².s) apply to marine mammals for non-impulsive sound sources.
- Marine mammal behavioural threshold based on the current interim US National Oceanic and Atmospheric Administration (NOAA) (2019) criterion for marine mammals (LF and HF) of 120 dB re 1 µPa (SPL; L_p) for non-impulsive sound sources.

Table 6-12: Thresholds for PTS, TTS and behavioural response onset in low-frequency (LF) and high-frequency (HF) cetaceans for impulsive and continuous noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: SEL _{24h} (dB re 1 µPa ² .s)	TTS onset thresholds: SEL _{24h} (dB re 1 µPa ² .s)	Behavioural response (dB re 1 µPa)	PTS onset thresholds: SEL _{24h} (dB re 1 µPa ² .s)	TTS onset thresholds: SEL _{24h} (dB re 1 µPa ² .s)	Behavioural response (dB re 1 µPa)
LF cetaceans	183	168	160	199	179	120
HF cetaceans	185	170		198	178	

Source: NMFS (2014, 2018; Southall, 2019; NOAA, 2019).

Acoustic emissions during pipelay activities are likely to have the greatest impact to marine fauna, given the estimated source levels for the PV (~190-192 dB re 1 µPa² m² s) and the duration of the pipelay activity. Pipelay will also cross the pygmy blue whale migration BIA, over an estimated period of approximately two months, and then carry on through the pygmy blue whale distribution range on the western side of the migration BIA to the end of the trunkline route adjacent to the FPU location. Pygmy blue whales migrate as solitary animals or in small groups along the continental slope and in deeper, offshore waters north of North West Cape, typically in water depths between 500 m and 1000 m on the way to and from the migration terminus in the Banda and Molucca seas, Indonesia, where calving is understood to occur (Double et al., 2014). The northern migration typically passes north-western Australia between approximately April to July with the return southern migration between October and January. As described in Section 4.6.3, the

migration BIA represents the area of core migratory routes for pygmy blue whales. There is likely to be occasional individual or small groups of whales transiting through the distribution range during the northbound or southbound migration seasons. The likelihood of encountering migrating or foraging pygmy blue whales is considered low with respect to the western extent of the pygmy blue whale distribution range.

Results – Acoustic Modelling

Modelling of sound propagation loss for the PV on DP (Scenario 1), in the Trunkline Project Area at a location within the PBW migration BIA, predicted that noise levels would drop below 120 dB re 1 µPa (behavioural response threshold for continuous noise sources; Table 6-12) within 14.5 km. The modelling also estimated propagation of combined noise from the PV during pipelay, along with B-Type and OSV alongside, both operating on DP (“normal operations” - Scenario 2). The modelling predicted combined noise levels from all three vessels would drop below 120 dB within 15.7 km. The maximum distance to the behavioural response threshold was 16.5 km (for Scenario 4 - normal operations + B-Type Bunkering at step away location 1, 10 km away), (Table 6-13). The modelling determined that for there to be no overlap of behavioural response zones for LF cetaceans (i.e. no overlap of the 120 dB isopleths and a larger onset area [R_{max} km²]) between the normal operations and the B-Type bunkering, there needs to be 25 km of separation between the two operations (Connell et al., 2022).

Considering the NMFS (2018) SEL_{24h} TTS threshold criteria for LF cetaceans (179 dB re 1 µPa².s), TTS onset could occur within 0.9 km from the PV on DP (Scenario 1) or 1.26 km from the combination of vessels (Scenario 2) (Connell et al., 2022). For LF cetaceans, the maximum distance to the PTS onset threshold was 150 m for any scenario. The maximum distance to TTS onset threshold from any scenario was 1.32 km (Table 6-13).

However, as demonstrated by the animat movement modelling results below, PTS and TTS criteria exceedances are based upon exposure for 24-hours by a stationary receptor, which is not a realistic scenario with reference to known pygmy blue whale or humpback whale behaviour. The SEL_{24h} criterion is a cumulative metric that reflects the dosimetric impact of sound energy accumulated over a 24-hour period and assumes that an animal is consistently exposed to such noise levels at a fixed location. The radii that correspond to SEL_{24h} therefore represent an unlikely worst-case scenario for SEL-based exposure since, more realistically, marine fauna would not stay in the same location or at the same range for 24-hours (Connell et al., 2022). It is highly unlikely that PTS and TTS thresholds would be exceeded given the small onset PTS and TTS range and furthermore it is highly unlikely given the known movement behaviour of cetaceans including key migrating LF whale species such as the pygmy blue whale and humpback whale transiting through the Operational Area.

For HF cetaceans, TTS onset could occur within 150 m for both Scenario 1 and PTS threshold for HF cetaceans was not reached within the limits of the modelled resolution (20 m) for any scenario modelled.

Table 6-13: Maximum predicted horizontal distances (R_{max}) to PTS, TTS and behavioural response thresholds in cetaceans, for all 12 scenarios

Hearing group	Sound exposure threshold	R _{max} distance (km)
PTS		
LF cetaceans	199 dB re 1 µPa ² .s (SEL _{24h})	0.15
HF cetaceans	198 dB re 1 µPa ² .s (SEL _{24h})	-
TTS		
LF cetaceans	179 dB re 1 µPa ² .s (SEL _{24h})	1.32
HF cetaceans	178 dB re 1 µPa ² .s (SEL _{24h})	0.15
Behavioural response		
LF cetaceans	120 dB re 1 µPa (SPL)	16.5
HF cetaceans		

A dash indicates the level was not reached within the limits of the modelled resolution (20 m).

Results – ANIMAT Modelling

Table 6-14 presents the animat modelling (JASMINE) results. For normal operations of the pipelay installation vessel activities, TTS onset probability of exposure of 88% within the 95th percentile exposure range (ER_{95%}) only occurs if a pygmy blue whale remains within 0.03 km of the source for a 24 hr period. PTS onset probability of exposure of 11% within the 95th percentile exposure range (ER_{95%}) only occurs if a pygmy blue whale remains within 0.01 km of the source for a 24 hr period. Single-exposure metrics, such as SPL, are not sensitive to changes in dwell time, but rather the distribution of noise within the water column and the use of the water column by the animat, and therefore ER_{95%} tends to be comparable to that predicted by acoustic propagation modelling. The ER_{95%} to the behavioural response SPL threshold ranged from 12.77 to 13.28 km. There was no significant variation in exposure range between the six modelled scenarios (Connell et al., 2022).

Table 6-14: Summary of animat simulation results for migrating pygmy blue whales indicating the maximum of the 95th percentile exposure ranges (in km) over all scenarios. The maximum probability of animats being exposed above threshold within the ER_{95%} is also provided for all modelled scenarios

Threshold		ER _{95%}		Scenario #	Scenario description	
Description	Threshold level (dB)	Distance (km)	Probability of exposure (%)			
TTS	SEL _{24h}	179 ¹	0.03	88	2	Normal operations – PV, B-Type, and OSV all under DP
PTS	SEL _{24h}	199 ¹	0.01	11		
Behavioural response		120 ²	13.28	77	4	Normal operations + B-Type bunkering at step away location 1

¹ LF-weighted SEL_{24h} (L_{E,24h}; dB re 1 µPa² · s)

² SPL (L_p; dB re 1 µPa)

Pygmy Blue Whale Migration BIA

The Blue Whale Conservation Management Plan (Action Area 2) states that anthropogenic noise in BIAs should be managed such that any blue whale continues to utilise the area without injury (Commonwealth of Australia, 2015a). Although TTS in cetaceans has previously been regarded as hearing impairment, not injury, advice from NOPSEMA and DAWE is that TTS should be considered a form of injury to pygmy blue whales and this should be prevented within the BIAs. However, as demonstrated above by the animat movement modelling, it is highly unlikely that PTS and TTS thresholds would be exceeded given the small onset PTS and TTS range, 10 and 30 m respectively, and furthermore it is highly unlikely given the known movement behaviour of pygmy blue whales, e.g an individual whale would have to follow the pipelay vessel for 24 hours. Therefore, it is not credible that PTS and TTS thresholds would be exceeded for pygmy blue whales transiting through the Operational Area in the northbound and southbound migration seasons as a result of pipelay activities and any other continuous noise sound sources from other installation related vessel-based activities.

The Operational Area for the Petroleum Activities Program intersects the pygmy blue whale migration BIA (from KP200 to KP274), and also overlaps with the broader pygmy blue whale distribution range (refer to (Figure 4 11)). Considering this overlap, as well as the recorded presence and satellite tracking of both north and south bound tagged individuals in the Operational Area (Thums et. al. (2022)), it is likely that transient individuals or small groups are occasionally in and around the Operational Area during migratory north and south seasons (April to July and October to January, respectively) (McCauley, 2011; Gavrilov et al., 2018; Thums et al., 2022). Significant numbers of pygmy blue whales are not expected to be encountered, particularly outside peak periods for northbound or southbound migrations (Figure 4 11).

The continental slope crossing seabed preparation activity requires vessel use and excavation. The vessel will be an OCV similar to the *Skandi Hercules* as described above, with a source of level of ~181 dB re 1µPa (SPL). This activity will be completed prior to pipelay and there will be no temporal overlap. Elevated sound levels have been observed when a grab bucket makes impact with the seabed (Dickerson et al., 2001), however and noise levels are largely dependent on the seabed substrate. Given that the seabed material along that section of the trunkline is sand/soft sediment (Section 4.4.3), significant noise emissions during the grab operations or other excavation methods proposed are not anticipated and the activity is not expected to exceed modelled noise levels and predicted noise exposure ranges for PTS, TTS and behavioural response for pipelay activities.

Whilst the Trunkline Project Area overlaps part of the pygmy blue whale migration BIA as described above, there is no overlap with known foraging areas for the species, as defined in the Blue Whale Conservation Management Plan (CMP).

In September 2021, the Department of Agriculture, Water and the Environment (DAWE) published guidance on key terms within the CMP, which provided a definition of ‘a foraging area’ and noted the potential for opportunistic foraging and feeding to occur outside these designated foraging areas. Pygmy blue whales may engage in opportunistic foraging during both northbound and southbound migrations, so there is the potential for this activity to occur in the Trunkline Project area, particularly where it overlaps the migration BIA (Thums et. Al. 2022). There are limited data to indicate that the area of the Exmouth Plateau overlapped by the Operational Area (Figure 4-15) represents an area where opportunistic foraging by pygmy blue whales occurs regularly (see Section 4.6.3)

Pygmy Blue Whale Distribution Range

The pipelay activities and other installation related vessel-based activities will extend through the pygmy blue whale distribution range on the western side of the migration BIA to the end of the trunkline route adjacent to the FPU location. The likelihood of encountering migrating or foraging pygmy blue whales is considered low with the occasional individual or small group of whales transiting through the distribution range during the northbound or southbound migration seasons see Section 4.6.3).

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Potential behavioural disturbance to pygmy blue whales within the migration BIA and distribution range is limited to any overlap with the northbound (April to July) and southbound (October to January) migratory seasons.

Humpback Whale BIA

Humpback whales are expected to be encountered during both pre-lay/post-lay seabed intervention (trenching and material disposal and offshore borrow ground dredging and backfill) and pipelay, particularly should these activities occur during annual migrations (July (northbound) and late August/September (southbound)). CEDA (2011) notes the scarcity of studies quantifying noise impacts from dredging, and any documented effects have been limited to behavioural response. As noted in Figure 6-5, elevated acoustic emissions do occur during dredging, however these are not expected to impact marine mammals any greater than acoustic emissions from transiting vessels (de Jong et al., 2010) and will be within the modelled acoustic footprint of vessel operations during pipelay described above. PTS and TTS impacts are therefore considered highly unlikely. Behavioural response may result in a deviation in course during migration, which is expected to be insignificant in the context of the long distances over which individuals migrate (thousands of kilometres). Marine mammals that are frequently exposed to sounds such as vessel noise may also habituate and adapt to this noise (Richardson et al. 1995; NRCC, 2003). This may be the case for the humpback whale population that regularly passes through areas of significant shipping traffic during their migrations.

The very high-frequency micro-pulses of sound produced by MBES and SSS during seabed surveys rapidly attenuate outside of the beam (MacGillivray et al., 2013; Zykov, 2013). The high operating frequencies of these instruments also places the majority of sound frequencies above the auditory range of most marine fauna species. Dolphins and other mid-frequency cetaceans, which have peak hearing sensitivity up to 110 kHz, with potential for some limited hearing ability up to approximately 160 kHz (NMFS 2018), may be able to detect a small amount of the sound energy from some survey instruments in the lower operating frequency ranges (MacGillivray et al., 2013; Zykov, 2013). The propagation of the high frequency sound from MBES and SSS has been undertaken by Zykov (2013) and MacGillivray et al. (2013). The modelling results indicate that the sound emissions outside of the main beams are below the threshold levels for potential injury, PTS or TTS. Sound levels that may result in behavioural effects are likely limited to within tens of metres, but potentially up to a few hundreds of metres from the sound source for some mid-frequency cetaceans such as dolphins (Zykov, 2013; MacGillivray et al., 2013). Varghese et al. (2020) recently studied the foraging behaviours and vocalisations of beaked whales (mid-frequency cetaceans) to 12 kHz MBES surveys and concluded there was not a consistent change in foraging behaviour during the MBES surveys that would suggest a clear response. The animals did not leave the area nor stop foraging during MBES activity. Geophysical and other survey activities using this technology or similar are therefore expected to result in temporary behavioural effects to marine mammals within tens or hundreds of metres from the survey activities. Such localised effects are smaller than those expected from the vessels and are not expected to be biologically significant.

Non-pipelay related vessel activities

Non-pipelay related vessel-based activities will occur along the proposed trunkline route at various times before, during and after the actual pipelay. Such vessel-based activities will be separated spatially and temporally. The behavioural onset range will be markedly reduced as compared to the worst-case credible modelled results for the pipelay, .i.e. 16 km behavioural response onset range.

If such activities occur within the migration BIAs for pygmy blue whales and humpback whales and during migratory seasons, there is likely to be a behavioural response from individuals or groups of whales transiting in relatively close proximity to vessel-based activities. The same applies to the pygmy blue whale distribution range to the west of the migration BIA though likelihood of encountering whales is much lower (refer to Section 4.6.3.1). Migrating pygmy blue whales and humpback whales are surrounded by open water with no restrictions (such as shallow waters, embayments) on an animal's ability to avoid the activities. Consequently, pygmy blue whales and humpback whales transiting through the area, may deviate slightly from their migration route, but can continue on their migration pathway without any biologically significant impacts.

Marine Reptiles

Five species of marine turtle may occur in the Operational Area: flatback, green, hawksbill, loggerhead and leatherback turtles. The Operational Area overlap interesting Habitat Critical and interesting buffer BIAs for the flatback, green and hawksbill turtle around the Dampier Archipelago and Montebello Islands (Section 4.6.2).

Species Sensitivity and Thresholds

There is a paucity of data regarding responses of marine turtles to continuous underwater noise. However, turtles have been shown to respond to low frequency sound, with indications that they have the highest hearing sensitivity in the frequency range 100–700 Hz (Bartol and Musick, 2003). Lenhardt (1994) observed marine turtles avoiding low-frequency sound.

Acute noise, or temporary exposure to loud noise, may result in the avoidance of important habitats and in some situations physical damage to marine turtles. McCauley et al. (2000) observed the behavioural response of caged sea turtles—green (*Chelonia mydas*) and loggerhead (*Caretta caretta*)—to an approaching seismic airgun. For received levels above 166 dB re 1 μ Pa (SPL), the turtles increased their swimming activity and above 175 dB re 1 μ Pa (SPL) they began to behave erratically, which was interpreted as an agitated state.

The sound exposure thresholds for marine turtles are summarised in Table 6-15 below. No numerical thresholds have been developed for impacts of continuous sources (e.g. vessel noise) on marine turtles. A Popper et al. (2014) review

assessed thresholds for marine turtles and found qualitative results that the risk of TTS was moderate for near field exposure, and low for both intermediate and far field exposure (Popper et al., 2014).

Table 6-15: Thresholds for PTS, TTS and behavioural response onset in marine turtles for impulsive and continuous noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: SEL _{24h} (dB re 1 µPa ² .s)	TTS onset thresholds: SEL _{24h} (dB re 1 µPa ² .s)	Behavioural response (dB re 1 µPa)	PTS onset thresholds: SEL _{24h} (dB re 1 µPa ² .s)	TTS onset thresholds: SEL _{24h} (dB re 1 µPa ² .s)	Behavioural response (dB re 1 µPa)
Marine turtles	204	189	166* 175*	220	200	(N) High (I) Moderate (F) Low

Source: PTS and TTS thresholds (Finneran et al., 2017), * behavioural response threshold (NSF 2011), + behavioural disturbance threshold (McCauley et al. 200).

Note: The sound units provided in the table above for continuous noise include: relative risk (high, medium and low) is given for marine turtles at three distances from the source defined in relative terms as near (N – tens of metres), intermediate (I – hundreds of metres) and far (F – thousands of metres) (after Popper et al. 2014).

Impact Assessment

The Recovery Plan for Marine Turtles (Commonwealth of Australia, 2017a) notes there is limited information available on the impact of noise on marine turtles and that the impact of noise on turtle stocks may vary depending on whether exposure is short (acute) or long-term (chronic). However, given the thresholds outlined in Table 6-15, it is reasonable to expect that marine turtles may demonstrate avoidance or attraction behaviour to the noise generated by the Petroleum Activities Program.

Turtles may occasionally be present in deeper waters of the Operational Area but are more likely to be encountered closer to the Dampier Archipelago where they may be present foraging year-round. Increased numbers of marine turtles may be present, albeit still in low numbers within the Operational Area, during interesting periods, and may be exposed to acoustic emissions from vessels during the trenching and material disposal and offshore borrow ground dredging and backfill. However, works of this nature closer or within sensitive turtle area (BIAs and Habitat Critical to the survival) will be limited to a period of months (Section 4.6.2) reducing the potential for impact at the individual and population level.

The islands of Dampier Archipelago provide nesting beaches for flatback, green, hawksbill and loggerhead turtles, with Rosemary Island being a major rookery for hawksbill turtles in WA. A study of internesting movements of individuals nesting on the Dampier Archipelago has not been conducted, however, tracking studies at other islands (Barrow and Thevenard) suggest internesting flatback turtles remain in shallow water, close (< 3 km) to nesting beaches (Whitlock et al., 2014). The Operational Area overlaps internesting Habitat Critical to the survival of flatback turtles, which is also designated a BIA. However, it is noted that the defined BIA and Habitat Critical are considered very conservative as they are based on the maximum range of internesting females and many marine turtles are more likely to remain near their nesting beaches. There is no evidence to date to indicate flatback turtles swim out into deep offshore waters during the interesting period.

As described above, acoustic modelling was conducted by JASCO based on cumulative noise from three vessels operating concurrently (Connell et al., 2021). Based on the application of the multiple SEL_{24h} thresholds (Finneran et al., 2017), PTS was not predicted to occur within the modelling resolution (20 m), and turtles could potentially experience TTS within 150 m (Table 6-16). However, marine turtles within the Operational Area are expected to be transient, and unlikely to remain with 150 m of the vessels for 24-hours, and therefore PTS and TTS thresholds are not expected to be reached. Behavioural impacts to marine turtles from continuous noise sources generated by the Petroleum Activities Program are expected to be short-term and localised.

Table 6-16: Maximum predicted horizontal distances (R_{max}) to PTS and TTS thresholds in marine turtles

Hearing group	Sound exposure threshold	R_{max} distance (km)*
Marine turtles	PTS	
	220 dB re 1 $\mu\text{Pa}^2\cdot\text{s}$ (SEL _{24h})	-
	TTS	
	200 dB re 1 $\mu\text{Pa}^2\cdot\text{s}$ (SEL _{24h})	0.15

N.B. A dash indicates the threshold was not reached within the limits of the modelling resolution (20 m).

During survey activities, the vessel will be continually moving; therefore, any behavioural responses would be temporary and are unlikely to negatively affect individual fitness or breeding success. Additionally, the duration of the activity is limited to days and will not be continuous within the Trunkline Project Area closer to islands/shore, where interesting BIAs are located.

Helicopter noise when on the sea surface may impact turtles (e.g. when basking or breathing). Typical startle responses occur at relatively short ranges (tens of metres) (Hazel et al., 2007) and as such, startle responses during typical helicopter flight profiles are considered to be remote. In the event of a behavioural response to the presence of a helicopter, turtles are expected to exhibit diving behaviour, which is of no lasting effect.

Potential impacts from routine acoustic emissions on marine turtles are expected to be limited to behavioural impacts within a localised area around the project vessels, with no lasting effect.

Fish, Sharks and Rays

A number of demersal and pelagic fish species will be present within the Operational Area. However, given species richness has been shown to correlate with habitat complexity (Gratwicke and Speight, 2005), it is unlikely that the sand/silt sediments that comprise the largest proportion of the Operational Area will support a wide diversity of species. Migratory species such as whale sharks may be present, particularly given a BIA for foraging overlaps of the Trunkline Project Area (~ KP 72 to KP 199).

Species Sensitivity and Thresholds

The majority of fish species detect sounds from <50 Hz up to 500-1500 Hz (Popper and Hawkins, 2019). A smaller number of species can detect sounds over 3 kHz, while very few species can detect ultrasound over 100 kHz (Ladich and Fay, 2013). The critical issue for understanding whether an anthropogenic sound will affect the hearing of a fish is whether it is within the hearing frequency range of the fish and loud enough to be detectable above background ambient noise.

Fish perceive sound through the ears and the lateral line, which are sensitive to vibration. Some species of teleost or bony fish (e.g. herring) have a structure linking the gas-filled swim bladder and ear, and these species usually have increased hearing sensitivity. These species are considered to be more sensitive to anthropogenic underwater noise sources than species such as cod (*Gadus* sp.), which do not possess a structure linking the swim bladder and inner ear. Fish species that either do not have a swim bladder (e.g. elasmobranchs (sharks and rays) and scomid fish (mackerel and tunas) or have a much-reduced swim bladder (e.g. flat fish) tend to have a relatively low auditory sensitivity.

Popper et al. (2014) developed sound exposure guidelines for fish, considering differences in fish physiology (Table 6-17).

Table 6-17: Thresholds for PTS, TTS and behavioural response onset in fish, sharks and rays for impulsive and continuous noise

Hearing group	Impulsive			Continuous		
	PTS onset thresholds: SEL _{24h} (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	TTS onset thresholds: SEL _{24h} (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	Behavioural response (dB re 1 μPa)	PTS onset thresholds: SEL _{24h} (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	TTS onset thresholds: SEL _{24h} (dB re 1 $\mu\text{Pa}^2\cdot\text{s}$)	Behavioural response (dB re 1 μPa)
Fish: no swim bladder	216	186	(N) High (I) Moderate (F) Low	(N) Low (I) Low (F) Low	(N) Moderate (I) Low (F) Low	(N) Moderate (I) Moderate (F) Low
Fish: swim bladder not	203	186	(N) High (I) Moderate	(N) Low (I) Low	(N) Moderate (I) Low	(N) Moderate (I) Moderate

involved in hearing			(F) Low	(F) Low	(F) Low	(F) Low
Fish: swim bladder involving hearing	203	186	(N) High (I) High (F) Moderate	170 dB rms SPL for 48-hours	158 dB rms SPL for 12-hours	(N) High (I) Moderate (F) Low
<p><i>Impulsive noise:</i> All criteria are presented as sound pressure, even for fish without swim bladders, since no data for particle motion exist.</p> <p><i>Continuous noise:</i> rms SPL: root mean square of time-series pressure level, useful for quantifying continuous noise sources. Relative risk (high, moderate, or low) is given for animals at three distances from the source defined in relative terms as near (N), intermediate (I), and far (F). Source: Popper et al. (2014)</p>						

Impact Assessment

Sound produced by the vessels on DP could cause recoverable injury to some fish species with a swim bladder involved in hearing, but only if the fishes are in very close proximity to the sound source, within 280 m, for 12-hours. Similarly, TTS effects could occur within 300 m of the vessels if the fish remained within this distance for 48-hours.

It is expected that potential impact to demersal and pelagic fish and sharks/rays is expected to be limited to a behavioural response. Behavioural responses are expected to be short-lived, with duration of effect less than or equal to the duration of exposure. While fish may initially be startled and move away from the sound source, once the source moves on fish would be expected to move back into the area.

The Operational Area overlaps a small proportion of the foraging BIA for whale sharks between about KP 72 and KP 199 and therefore they may be seasonally present between March and November (with the annual peak aggregation at Ningaloo Reef between April and May) (Figure 4-8), as demonstrated by acoustic detections of tagged whale sharks at the North Rankin A and Goodwyn A platforms during two periods—June to July and October to January (Thomson et al. 2021). This overlap represents a very small proportion of the overall area of the BIA (0.22%), and the Operational Area is located at least 215 km from the whale shark foraging (high density prey) BIA adjacent to Ningaloo Reef. Behavioural disturbance to whale sharks as a result of vessel noise may result in a temporary deviation on their migration route, which covers a wide area and is not spatially restricted. The potential extent of disturbance effect for vessels associated with pipelay is expected to be considerably smaller than predicted for marine mammals (up to 13.28 km predicted for a migrating pygmy blue whale using animat movement modelling).

Commercial fish spawning

Depth ranges and key spawning periods for six key indicator commercial fish on the NWS are as follows:

- red emperor – depth range 10–180 m, spawns Sept–June (bimodal peaks Sept–Nov and Jan–Mar);
- rankin cod – depth range 10–150 m, spawns June–Dec and Mar (peak Aug–Oct);
- goldband snapper – depth range 50–200 m, spawns Oct–May;
- bluespotted emperor – depth range 5–110 m, spawns Jul–Mar;
- ruby snapper – depth range 150–480 m, spawns Dec–Apr (peak Jan–Mar); and
- spanish mackerel – depth range 1 m to at least 50 m, spawns Sept–Jan.

It is believed that all of these species undergo group spawning throughout their range, rather than aggregating at specific locations. The Operational Area overlaps the depth ranges for these key indicator commercial fish species, and the timing of activities means that there would be overlap with peak spawning periods for a number of these species. However, as described above, the potential impact of acoustic emissions on demersal and pelagic fishes is expected to be limited to a short-lived behavioural response confined to a few hundred metres from the project vessels. As such, the potential for the Petroleum Activities Program to impact spawning of key indicator commercial fish species is assessed as being extremely low.

Potential impacts from acoustic emissions on fish, sharks and rays are likely to be restricted to localised and temporary avoidance behaviour while transiting through the Operational Area, and individuals impacted are unlikely to represent a significant proportion of the population with the Operational Area and the NWS region overall.

AMPs

The North-west Marine Parks Network Management Plan (DNP, 2018a) lists the natural values of the Montebello and Dampier AMPs as including a range of threatened, migratory, marine or cetacean species listed under the EPBC Act, as well as BIAs that include seasonal breeding habitat for seabirds, internesting habitat for marine turtles and a migratory pathway for humpback whales. The Montebello AMP also includes foraging, mating, and nesting habitat for marine turtles and foraging habitat for whale sharks, while the Dampier AMP includes foraging habitat for seabirds.

For activities occurring within the Montebello Marine Park, and adjacent to the Dampier Marine Park, the short-term and transient nature of activities associated with acoustic emissions will not be inconsistent with the objective of the Multiple Use Zone (VI) to provide for ecologically sustainable use and the conservation of ecosystems, habitats and native species, or for the Habitat Protection Zone (IV) to provide for the conservation of ecosystems, habitats and native

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

species in as natural a state as possible, while allowing activities that do not harm or cause destruction to seafloor habitats. The values identified for both these Marine Parks including BIAs for marine turtles will not be impacted given the significant distance from sensitive locations. Therefore, no impacts are expected to the cultural values of the AMP as those are intrinsically linked to the natural values described above. Impacts from acoustic emissions are therefore not inconsistent with the objectives of the North-west Marine Parks Network Management Plan or the zoning of the Montebello and Dampier AMPs (DNP, 2018a).

Cumulative Impacts

Table 6-1 outlines potential concurrent activities that will contribute to cumulative underwater noise levels during the Petroleum Activities Program, which involves use of the following series of vessels:

- Survey vessel + [DP MODU + supply vessel];
- Construction vessel + [DP Pipelay Vessel + pipe supply vessel + support vessel] + [DP MODU + supply vessel]; and
- Construction vessel + [DP MODU + supply vessel].

Of these three different potential concurrent activities, scenario 2 represents the worst-case with respect to cumulative underwater noise levels. At the most western extent of the Trunkline Project Area (PLET location) the trunkline route passes within ~2.5 km of the nearest Scarborough development well (Well 5). As described in Section 6.2.1 and outlined in Table 6-1, there is the potential for concurrent activities to occur, with the pipelay vessels (PV, B-Type and OSV) laying the trunkline concurrently with the installation of the PLET using an OCV, and drilling via a MODU. Depending on well sequencing, the pipelay vessels may pass within 2.5 km of a MODU on DP, should it be engaged in drilling operations at the Well 5 location. These three concurrent activities (PLET foundation installation, trunkline installation, and drilling/completions) are expected to occur around April 2024 for a period of several weeks (refer Table 6-1). The sequence for drilling and completions is subject to change due to well drilling time efficiencies, waiting on weather, xmas tree installation sequence and other factors. The other Scarborough development wells are located >7.5 km from the trunkline route, and therefore noise from the MODU and support vessels is unlikely to result in any significant cumulative impacts.

If this concurrent scenario eventuates, there is the potential for cumulative impacts from underwater noise emissions. The timing of these three concurrent activities (April 2024 for a period of several weeks) may overlap the shoulder period of northbound migration for pygmy blue whales through the NWMR (April to July).

It is important to note that the concurrent presence of the pipelay vessels, MODU and OCV within ~3 km of each other would not represent a tripling of impacts underwater acoustic emissions in adjacent waters (i.e. impacts do not scale linearly). This is evident from modelling and measurement studies of composite underwater noise footprints of MODUs, support vessels and construction vessels in the Chukchi Sea in the Arctic (Quijano et al. 2018).

The combined sound fields are likely to result in a marginal increase in the maximum range to the behavioural response threshold for LF cetaceans (i.e. >16 km) as compared to the range for the single largest activity. As Well 5 and the PLET location are at least 50 km from the western boundary of the pygmy blue whale migration BIA but within the distribution range, where there is a lower likelihood of encountering either migrating or foraging pygmy blue whales even during peak periods of the migration seasons. Migrating pygmy blue whales are surrounded by open water with no restrictions (such as shallow waters, embayments) on an animal’s ability to avoid the activities. Consequently, pygmy blue whales transiting through the area, may deviate slightly from their migration route, but would be otherwise impeded from continuing on their migration pathway without any biologically significant impacts.

It is noted that in addition to the three vessels and four sources modelled (Connell et al., 2022), an additional OCV with work class ROV (similar to the *Fugro Etime*) may be required to monitor touchdown of the trunkline between approximately KP 280 to 365. However, given the OCV will follow behind the PV at a distance of 2.5 – 3.5 km the cumulative contribution of this additional vessel will be very small and the extent of predicted impacts (i.e. behavioural disturbance) is expected to only increase slightly from the modelled scenarios.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity Level	Magnitude	Impact Significance Level
Ambient Noise	Change in ambient noise	Low value (open water)	No lasting effect	Negligible (F)
Marine mammals	Change in fauna behaviour	High value species	No lasting effect	Slight (E)
Marine reptiles	Change in fauna behaviour	High value species	No lasting effect	Slight (E)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fish, sharks and rays	Change in fauna behaviour Hearing impairment to fauna	High value species	No lasting effect	Slight (E)
Overall Impact Significance Level: The overall impact significance level for routine acoustic emissions is E based on no lasting effect to the high value receptors (marine mammals, marine reptiles, fish, sharks and rays). The impact significance levels for individual receptors are consistent with the levels rated in the Scarborough OPP.				

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation Codes and Standards				
EPBC Regulations 2000 – Part 8 Division 8.1 Interacting with cetaceans, including the following measures ²⁸ : <ul style="list-style-type: none"> Vessels will not travel greater than 6 knots within 300 m of a cetacean (caution zone) and not approach closer than 100 m from a whale. Vessels will not approach closer than 50 m for a dolphin or and/or 100 m for a whale (with the exception of animals bow riding). If the cetacean shows signs of being disturbed, project vessels will immediately withdraw from the caution zone at a constant speed of less than 6 knots. 	F: Yes. CS: Minimal cost. Standard practice.	Implementation of controls for reduced vessel speed around cetaceans can potentially reduce the underwater noise footprint of a vessel and lower the likelihood of interaction above significant thresholds	Controls based on legislative requirements – must be adopted.	Yes C 6.1
Vessels will not travel greater than 6 knots within 250 m of a whale shark and not allow the vessel to approach closer than 30 m of a whale shark.	F: Yes. CS: Minimal cost. Standard practice.	Implementation of controls for reduced vessel speed around whale sharks can potentially reduce the underwater noise footprint of a vessel	Legislative control for state waters, Whale Shark Interaction Protocol, being adopted for the Petroleum Activities Program.	Yes C 6.10
Good Practice				
The use of trained vessel crew as MFOs on B-Type vessels PV and OCV to observe and record cetacean presence / activity as required.	F: Yes. Vessel bridge crews already maintain a constant watch during operations so can be trained in, and carry out, cetacean observations. CS: Additional cost of training	Trained MFOs on vessel bridge can increase understanding of PBW presence in the area Operational Area, with information assisting in decision making relating to cumulative noise reduction measures.	Benefits outweigh cost/sacrifice.	Yes C 6.2

²⁸ For safety reasons, the distance requirements are not applied to vessel(s) holding station or with limited manoeuvrability e.g. anchor handling, loading, back-loading, bunkering, close standby cover for overside working and emergency situations.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Implement adaptive management procedures so that only one B-type vessel on DP (including for refuelling) at any one time within 25 km of PV and pipelay activities. i.e. second B-type may be within the 25 km zone so long as it's not on DP.	F: Yes. CS: Potential for pipe delivery delays and inability to continue welding / laying pipeline, time and monetary costs in MFO training for vessel crew	A risk-based approach to management actions can be applied so greatest risk reduction is implemented during migration season/BIA and then controls cascade commensurate with the level of risk (i.e. peak north-bound migration, distribution area etc.)	Benefits outweigh cost/sacrifice.	Yes C 6.5
During contingent pipe transfer (while two B-types on DP alongside the PV instead of the usual one) - restrict second B-type from entering within 25km radius of the PV, even while B-type is not on DP, to account for MFO observation zone being less than distance to cetacean behavioural threshold SPL.	F: Yes CS: Delay in pipe unloading and reduction in vessel efficiency, increased vessel transit time and fuel use.	Restrictions on the presence of a second B-type whilst in transit (when it is not on DP) in proximity to the PV has limited benefits. Noise modelling carried out shows there is only a marginal increase in cumulative impact of a second B-type on DP alongside the PV. This impact is even less for B-types in transit (as modelling assumed DP thruster power usage greater than non-DP engine usage). Cetacean presence in the migration BIA and surrounding distribution zone is expected to be transitory, with feeding being opportunistic.	Control not commensurate with the level of risk.	No
Critical equipment onboard OCV, RIV and TSHD subject to periodic maintenance to ensure optimal performance	F: Yes. Preventative maintenance is a usual activity carried out to maintain vessel systems and equipment. CS: Time and financial cost of maintenance	Ensuring appropriate on-board maintenance occurs for critical equipment (i.e., thrusters) can reduce vibration and in water noise profile of a vessel	Benefits outweigh cost/sacrifice	Yes C 6.6
Carry out surveys (aerial / vessel based) around PV to confirm distribution and abundance of PBW, while the PV is operating in the PBW migration BIA during migration period (Apr-Jul & Oct-Jan)	F: Yes. It is possible to carry out aerial/vessel surveys around the PV CS: Financial costs associated with plane/pilot and vessels MFO hire as well as logistics of flight planning. Distance off shore would restrict duration	Surveys may increase understanding of PBW activity around the PV but no reduction in likelihood of PBW contact with underwater noise above impact levels that cannot already be achieved by other observation methods.	Cost/sacrifice outweighs benefit	No

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
	/ efficacy of such surveys.			
Manage vessel speed in the humpback and PBW whale BIAs in migratory seasons within the Operational Area (excluding Pilbara Port)	F: Yes. It is possible to carry out for vessels transiting within the Operational Area CS: Slower vessel speeds reduces fuel use but will impact slightly with longer transit times for vessels.	There is mounting evidence that reduction of vessel speeds can reduce vessel underwater noise emissions. The Pilbara Port boundaries have been excluded As the Pilbara Port Authority sets speed limits for within the Port boundaries	Benefits outweigh cost/sacrifice	Yes C 6.7
Professional Judgement – Eliminate				
Eliminate generation of noise from vessels or equipment.	F: No. The generation of noise from these sources cannot be eliminated due to operating requirements. Note that vessels operating on DP may be a safety critical requirement. CS: Inability to conduct the Petroleum Activities Program. Loss of project.	Not considered – control not feasible.	Not considered – control not feasible.	No
Implement seasonal avoidance for pipelay activities within pygmy blue whale or humpback whale BIAs during migratory periods	F: No. CS: Activity timing driven by vessel availability, completion of seabed preparation activities and project scheduling to achieve required milestones and limit SIMOPS/ concurrent installation campaigns in-field	Avoidance of BIAs during migratory seasons can reduce cetacean exposure and impact potential.	Cost/sacrifice outweighs benefit	No
Schedule well sequence to ensure that drilling and xmas tree installation at Well 5 does not coincide with pipelay in adjacent waters, or PLET foundation installation	F: Yes. CS: Cost and schedule impacts due to delays in securing MODU and support vessels for specific timeframes	Concurrent drilling of Well 5, pipelay and PLET foundation installation would result in marginal increase in distance to behavioural response threshold for pygmy blue whales. Well 5 and PLET location are at least 50 km from the western boundary of the pygmy blue whale migration BIA but within the distribution range, where there is a lower likelihood of encountering either	Cost/sacrifice outweighs benefit	No

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
	in significant delays to the project. Ideal (calm) sea states for Trunkline installation occur over the summer months and sea states during winter months may introduce additional health and safety risks if laying pipe in marginal weather windows.			
Variation of the timing of the vessel activities to avoid peak turtle interesting periods	<p>F: Yes. It is possible to avoid peak interesting periods, however the risk of potential impacts from acoustic emissions is considered to be low given the location and water depth of the Operational Area.</p> <p>CS: Significant cost and schedule impacts due to delays in securing vessels for specific timeframes. The Petroleum Activities Program is due to be undertaken over 12 months with activities completed sequentially. Ideal (calm) sea states for Trunkline installation occur over the summer months.</p>	Impacts to interesting turtles resulting from acoustic emissions are expected to be low, therefore no reduction in consequence by adopting this control.	Grossly disproportionate. Implementation of the control requires considerable cost sacrifice for minimal environmental benefit. The cost/sacrifice outweigh the benefit gained.	No
Professional Judgement – Engineered Solution				
Carry out maintenance and inspection regime on the PV thrusters prior to mobilisation to Operational Area, to ensure optimal performance.	<p>F: Yes. Ability to inspect and maintain thrusters and DP operating systems for PV.</p> <p>CS: Time and monetary cost of inspections and repair activity if required</p>	Ensuring thrusters and DP operating systems are maintained and running at optimal levels reduces vibration and other superfluous noise sources.	Benefits outweigh cost/sacrifice.	Yes C 6.9
Use night-time thermal imagery or vessel system prior to vessel transfers at night, to monitor for cetacean activity while the PV is operating in the PBW migration BIA during migration period (Apr-Jul & Oct-Jan).	<p>F: Not Feasible.</p> <p>CS: Cost of technology</p>	Being able to identify cetacean presence at night (whilst not species specific) can reduce the likelihood that the whales encounter cumulative underwater noise that is above impact thresholds.	Not Feasible.	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Use of Autonomous Underwater Vehicle (AUV) to monitor for presence of pygmy blue whales using detection of their vocalisations.	F: Yes. Could be deployed from support vessel CS: Costs associated with obtaining and operating the technology. Schedule delays while data is collected and interpreted (not real time monitoring)	Limited benefit as the technology relies on Pygmy Blue Whale vocalisation, which is currently not well understood, particularly during foraging activities. Technology and applications still under development and not widely tested in field. Application limited due to lack of real time capability.	Cost/sacrifice outweighs benefit.	No
<p>ALARP Statement:</p> <p>As identified in the DAWE (now DCCEEW) and NOPSEMA guidance on key terms within the CMP, where it can be reasonably predicted that blue whale foraging is probable, known or whale presence is detected, adaptive management (C6.5, C6.8 and C6.9) should be used during industry activities to prevent unacceptable impacts (i.e., no injury or biologically significant behavioural disturbance) to blue whales from underwater anthropogenic noise.</p> <p>On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e., Decision Type A, Section 2.3.3), Woodside considers the potential impacts from noise emissions to be ALARP. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.</p>				

Demonstration of Acceptability
Acceptability Criteria and Assessment
<p>The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5):</p> <ul style="list-style-type: none"> Overall impact significance levels for individual receptors are consistent with the levels rated in the Scarborough OPP. EPOs and controls in the Scarborough OPP that are relevant to routine acoustic emissions have been adopted. Additional guidance on key terms within the Conservation Management Plan for the Blue Whale (the CMP) was issued in September 2021 and these were considered in the risk assessment and assessment against relevant actions in the CMP. The Petroleum Activities Program is not considered to be inconsistent with the relevant actions of this plan (refer Section 6.9). The activity is not inconsistent with any other requirements of the EPBC Act (refer Section 6.9). There are no changes to internal/external context specific to this risk from the Scarborough OPP. Impacts from noise was raised during stakeholder consultation (Appendix F, Table 1) and these were considered in the finalisation of the EP.
<p>Acceptability Statement:</p> <p>The impact assessment has determined that, given the adopted controls, the Petroleum Activities Program is unlikely to result in an impact significance level greater than Slight. Relevant EPBC Act requirements (principles of ESD; MNES significant impact guidelines; recovery plans, conservation advice and marine park management plans) have been considered during the impact assessment. The Petroleum Activities Program is not considered to be inconsistent with any relevant EPBC Act requirements, including the objectives, overall recovery objectives and actions of relevant recovery plans, conservation advice and management plans (Section 6.9.2).</p> <p>The impact assessment has determined that the generation of noise from project vessels and positioning equipment will not result in an impact greater than localised and temporary impacts, with no lasting effect. Relevant recovery plans and conservation advice have been considered during the impact assessment. The Conservation Management Plan for the Blue Whale (Commonwealth of Australia, 2015a) Interim Recovery Objective is that 'Anthropogenic threats are demonstrably minimised' with the following Action Area A.2.3: "Anthropogenic noise in biologically important areas will be managed such that any blue whale continues to utilise the area without injury, and is not displaced from a foraging area". The associated Guidance on Key Terms within the Blue whale Conservation Management Plan (DAWE, 2021) provides further clarification that where it can be reasonably predicted that blue whale foraging is probable, known or</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

whale presence is detected, adaptive management should be used during industry activities to prevent unacceptable impacts. The impact assessment determined it is considered highly unlikely that individual PBW that may pass through the Operational Area during the Petroleum Activities Program would experience PTS or TTS, given individuals would need to remain within 0.01 km (PTS) and 0.03 km (TTS) of the conservative worst-case credible vessel spread for a period of 24 hours. This is considered highly unlikely given the understanding of behaviour of pygmy blue whales (Section 4.6.3). In addition, with the adoption of adaptive management controls (C 6.5) the activity will be managed to reduce anthropogenic noise on pygmy blue whales and is therefore not inconsistent with The Conservation Management Plan for the Blue Whale (Section 6.9).

The adopted controls are considered consistent with industry good practice and professional judgement and meet the requirements of Part 8 (Division 8.1) of the EPBC Regulations 2000. The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of acoustic emissions to a level that is broadly acceptable.

Description of Source of Impact/Risk														
Accommodation is provided for up to 702 people maximum (usually 550) onboard the PV (Castorone), approx. 90-200 people onboard construction vessels, approx. 220 (maximum 278) people onboard the SWLB and around 20 people onboard support vessels. Project vessels routinely generate/discharge:														
<ul style="list-style-type: none"> Sewage and Greywater: Small volumes of treated sewage, putrescible wastes and grey water will be routinely generated/discharged to the marine environment (impact assessment based on approximate discharge of 5-15 m³ per vessel per day). Using a rate of 0.375 m³/person/day as a guide (NERA, 2017), it is expected that vessel discharges will range from ~ 262 m³/day from the largest vessel (~700 people onboard) to ~ 9.5 m³/day from a support vessel. Food waste: Vessel crew and passengers will generate food waste, estimated to be in the order of 1–2 kg per person per day, which will be discharged to the marine environment under controlled conditions. Deck and Bilge Water: Routine/periodic discharge of relatively small volumes of bilge water will occur from vessels. Bilge tanks receive fluids from many parts of the vessels. Bilge water can contain water, oil, detergents, solvents, chemicals, particles and other liquids, solids or chemicals. There is also variable water discharge from vessel decks directly overboard or via deck drainage systems. Potential sources include rainfall events and/or

deck activities such as cleaning/wash-down of equipment/decks. Lubricants may be used in equipment such as the grab dredger and TSHD drag head.

- **Brine and Cooling Water:** Cooling water from machinery engines and brine water produced during the desalination process of reverse osmosis to produce potable water on board the vessels will be routinely discharged. Depending on vessel, seawater used for cooling purposes will be routinely discharged at a temperature expected to be less than 70°C and rates of approximately 50 m³/d.
- **Cement and Grout:** During span rectification works, cement discharges may occur from overflow while filling/filtering of cement through cement bags for span rectification; line washout (down line cleaning); or cement unit washout from onboard the vessel.

Project vessels are predominantly transient through the Operational Area whilst discharging, with the greatest risk associated with the PV given the low transit speed during activities. The Petroleum Activities Program may not be executed as a single campaign or in a consecutive sequence, therefore the routine and non-routine vessel discharges may occur at any time during the approval period of the EP.

Detailed Impact Assessment

Assessment of Potential Impacts

Water Quality

Monitoring of vessel sewage discharges has demonstrated that a 10 m³ sewage discharge over 24 hours from a stationary source in shallow water, reduced to about 1% of its original concentration within 50 m of the discharge location (Woodside, 2008). Monitoring stations confirmed that discharges were rapidly diluted or nutrients rapidly metabolised and no elevations in water quality parameters (e.g. total nitrogen, total phosphorous and selected metals) were recorded above background levels at any station.

Discharge of food waste has the potential to change the local water quality for a short period through the addition of a temporary nutrient source, however this nutrient loading would rapidly return to background conditions following dispersion in the water.

Deck drainage and treated bilge water may contain a range of chemicals, oil, grease and solid material; however these discharges are expected to rapidly dilute in the water column (Shell, 2010). In addition, vessels are typically moving during discharges of treated bilge water, which promotes mixing and dilution.

The key physicochemical stressors that are associated with reject brine and cooling water discharge include salinity, pH, temperature and chemical toxicity. Water quality of the surrounding environment may be altered through the addition of chemicals and an increase in salinity. Scale inhibitors and biocides are commonly used within the systems described above to prevent fouling. Scale inhibitors are typically low molecular weight phosphorous compounds that are water-soluble, and only have acute toxicity to marine organisms about two orders of magnitude higher than typically used in the water phase (Black et al., 1994). The biocides typically used in the industry are highly reactive and degrade rapidly (Black et al., 1994).

The potential impacts on water quality due to cooling water discharge include chlorine toxicity and increased water temperatures. Discharges will disperse and dilute rapidly, with impacts to water quality localised to the discharge point.

Reject brine water is typically 20–50% higher in salinity to the surrounding water and based on models developed by the US EPA (Frick et al., 2001), discharges of brine water will sink through the water column where it will be rapidly mixed with receiving waters and dispersed by ocean currents, decreasing in salinity rapidly as distance from source increases.

Generally, reject brine and cooling water containing chemical additives are inherently safe at the low dosages used. They are usually consumed in the inhibition process, so there is little or no residual chemical concentration remaining upon discharge.

Cement discharges may occur, from overflow, and can result in turbidity in the water column. Reduction in water quality will be temporary (limited to the cement operational discharges) and due to small volumes are likely to be subject to rapid dispersion and dilution by prevailing currents.

Impacts from routine and non-routine discharges from vessels on water quality will have no lasting effect due to the transient nature of vessels, with little continuous discharge in a stationary location. Project vessels with the greatest volumes of discharge and slow transit speed are expected to be operational for a short duration (<6 months). Furthermore, routine and non-routine vessel discharges occur in a localised mixing zone, with a high level of dilution into the open water marine environment of the Operational Area.

Sediment Quality

Impacts associated with routine and non-routine deck and bilge water discharges will be limited to the area surrounding the discharge source of the vessel. Due to the dispersive nature of the discharges within the highly mixed offshore marine environment, any toxins associated with transient surface discharges are not expected to reach marine sediments at concentrations that will result in notable changes to sediment quality.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Increased salinity and other toxins from chemical additives in brine and cooling water discharges could potentially accumulate in benthic sediments, causing changes to sediment quality. However, the transient nature of project vessels and the water depth of the Operational Area (approximately 31 m at the State waters boundary to 1400 m near the FPU), indicate discharges of cooling water and brine are expected to disperse before reaching the seabed and no change in sediment is expected.

Cement discharges at the seabed are expected to be minimal and once the cement has hardened, chemical additives are locked into the cement (Terrens et al., 1998) and not expected to pose any toxicological risk to benthic biota from leaching or direct contact. The physical sediment properties of the area directly adjacent to the discharge location will be permanently altered however it will be a highly localised physical footprint and is not expected to affect the overall diversity or ecosystem function of the benthic communities of the area.

The potential impacts to benthic communities caused by smothering from a surface release of cement are expected to be minimal due to small volumes, intermittent nature of these discharges, and high potential for dispersal by ocean currents. This impact on soft sediment communities is not expected to affect the diversity or ecosystem function in this area and is only considered a localised impact.

Marine Fauna

A change in water quality from the discharge of sewage and greywater could result in injury or mortality to marine fauna. This could be the result of oxygen depletion in the waters due to nutrient enrichment, or due to toxins and chemicals present in the discharged wastes. Open marine waters are typically influenced by regional wind and large-scale current patterns resulting in the rapid mixing of surface and near surface waters where sewage discharges may occur. This means nutrients from the discharge of sewage will not accumulate or lead to eutrophication due to the highly dispersive environment. Therefore, the receptors with the greatest potential to be impacted are those in the immediate vicinity of the discharge (NERA, 2017). Given that sewage discharges from vessels are at or near the surface, and remain buoyant, the receptors with the potential to be impacted are also those within or on surface waters; i.e. plankton, fish and other marine fauna.

Discharge of food waste into the marine environment has the potential to attract some opportunistic marine fauna including fish and seabirds to the area in response to the increased food availability or, indirectly because of attraction of prey species. However, given the small quantities of food waste to be disposed, any attraction is likely to be minor, temporary and localised.

As a result of a change in water quality, further impacts to receptors may occur, which include injury or mortality to marine fauna resulting from exposure to toxins in the deck drainage and treated bilge water discharge. The discharges, which may include non-organic contaminants, will rapidly dilute. Such discharges are expected to be intermittent and in very small quantities and concentrations as to not pose any significant risk to any relevant receptors.

As discharges will be sporadic (i.e. no continuous flow), there is no potential for fluids to accumulate in the water column.

It is possible that marine fauna transiting the localised area may come into contact with these discharges (e.g. marine turtles, humpback whales, whale sharks, as they traverse the Operational Area, Section 4.5.1). Increased salinity and other toxins from chemical additives in brine and cooling water discharges could potentially harm marine fauna. Due to the relatively inert properties and low concentrations of scale inhibitors and biocides within the brine and cooling water discharge, the high level of dilution and mixing within the receiving offshore environment and the limited area of impact, impacts (if any) to pelagic species are expected to be highly localised. While the likely presence of marine fauna varies at different times of the year depending on migration, foraging and breeding patterns in the region, the potential for impact remains low due to the localised nature of discharges and rapid dilution.

Plankton

Routine and non-routine discharges may affect the ecophysiology of marine organisms as a result in changes of salinity. Studies indicate that effects from increased salinity on planktonic communities in areas of high mixing and dispersion are generally limited to the point of discharge only (Azis et al., 2003). Research has demonstrated that zooplankton are not affected in areas of sewerage or greywater discharge for transient vessels (Mearns et al., 2003; Ytreberg et al., 2020). Plankton communities are expected to rapidly recover from short term, localised impacts due to their naturally high mortality, and rapid replacement rates (UNEP, 1985).

Planktonic productivity in the NWMR is low. No significant impacts from the planned routine discharges are expected, because of the minor quantities involved, the expected localised mixing zone and high level of dilution into the open water marine environment of the Operational Area. Impacts to plankton from grey water, sewerage or brine and cooling water discharges is not expected.

Aesthetic Values

The composition of sewage and greywater may include physical particulate matter such as solids composed of floating, settle able, colloidal and dissolved matter. These substances can affect aspects of aesthetics such as ambient water colour, the presence of surface slicks/sheens and odour. However, as vessels will be moving during the discharge of sewage and greywater, this will promote mixing and dilution of the waste.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Given the distance of the project offshore, the proximity of water quality changes to the discharge source, the rapid consumption of matter by planktonic species and bacteria, and the spatial nature of tourism and recreation activities and coastal settlements (i.e. on or near the shoreline); impacts to receptors associated with changes in aesthetic values are not expected to occur.

AMPs

The Operational Area overlaps the Montebello Marine Park, and the Dampier Marine Park is less than 1 km from the Borrow Ground Project Area. The North-west Marine Parks Network Management Plan (DNP, 2018a) lists the natural values of the Montebello and Dampier AMPs as including a range of threatened, migratory, marine or cetacean species listed under the EPBC Act and cultural values which are intrinsically linked to those natural values. For activities occurring within the Montebello Marine Park, and adjacent to the Dampier Marine Park, the short-term and localised impacts of routine and non-routine discharges in open waters will not be inconsistent with the natural and cultural values and objective of the Multiple Use Zone (VI) to provide for ecologically sustainable use and the conservation of ecosystems, habitats and native species, or for the Habitat Protection Zone (IV) to provide for the conservation of ecosystems, habitats and native species in as natural a state as possible, while allowing activities that do not harm or cause destruction to seafloor habitats. Impacts are therefore not inconsistent with the objectives of the North-west Marine Parks Network Management Plan or the zoning of the Montebello and Dampier AMPs (DNP, 2018a).

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity Level	Magnitude	Impact Significance Level / Risk Consequence
Water quality	Change in water quality	Low value (open water)	No Lasting Effect	Negligible (F)
Sediment quality	Change in sediment quality	Low value	No Lasting Effect	Negligible (F)
Migratory Shorebirds and Seabirds	Injury/mortality or behavioural changes to marine fauna	High value species	No lasting effect	Slight (E)
Fish		High value species	No lasting effect	Slight (E)
Marine Mammals		High value species	No lasting effect	Slight (E)
Marine Reptiles		High value species	No lasting effect	Slight (E)
Plankton		Low value (open water)	No lasting effect	Negligible (F)
AMPs		High value	No lasting effect	Slight (E)

Overall Impact Significance Level/ Risk Consequence: The overall impact significance level for routine and non-routine discharges from vessels is E based on no lasting effect to marine fauna. The impact significance level for water quality is consistent with the level rated in the Scarborough OPP. Potential impacts to marine fauna and AMPs have been additionally assessed in this EP. There is no change in magnitude of impact (no lasting effect); however, the impact significance level is slightly higher due to the higher receptor sensitivity level.

the higher receptor sensitivity level. This is not considered a significant change to the overall environmental impact and risk assessed in the Scarborough OPP.

- EPOs and controls in the Scarborough OPP that are relevant to routine discharges have been adopted.
- There are no changes to internal/external context specific to this risk from the Scarborough OPP, including issues raised during stakeholder consultation.

Acceptability Statement:

The impact assessment has determined that, given the adopted controls, routine and non-routine discharges vessels are unlikely to result in an impact significance level greater than negligible. A number of BIAs for EPBC Act listed Threatened or Migratory species overlap the Operational Area (refer to Section 4.6). The adopted controls are considered consistent with industry legislation, codes and standards, and professional judgement and meet the requirements of Australian Marine Orders.

The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of these discharges to a level that is broadly acceptable.

seawater ingress will be pushed out of the trunkline with treated water, which is used to prevent corrosion and maintain the integrity of the trunkline. Seawater will be treated with the same chemicals as for the contingent FCGT process. The Trunkline would be dewatered from shore to offshore. The discharge could occur at any point along the Trunkline, with the location dependent on where the Trunkline was cut to remove the buckled section. Discharge volume and chemical concentrations are dependent on the dewatering option selected. These include:

- Pre-flooding of the trunkline with treated seawater: this involves first flooding the length of the trunkline with treated seawater, at 350 ppm. Therefore, the discharge volume will vary dependent on the location of the wet buckle. The discharge volume will increase the further along the Trunkline a wet buckle occurs, due to the greater volume of flushing required to reduce salt contamination in the Trunkline. A wet buckle around KP 32 for example could result in a discharge of chemically treated seawater around 19,080 m³ while a wet buckle around KP432 (i.e. at the end of the trunkline) could result in a discharge of treated seawater approximately 243,256 m³. A wet buckle along the Trunkline route between these two points would have a discharge in between these volumes i.e. KP 190 would result in a discharge around ~210,000 m³.
- Pre-flooding the trunkline with untreated seawater followed by treated freshwater slugs: this involves using a pig train separated by chemically treated fresh water (desalination) slugs to dewater the trunkline. The volumes of treated water would be up to approximately 1200 m³ of freshwater treated with chemicals up to 700 ppm.

Table 6-18: Estimated contingent Trunkline discharges

	Full Trunkline	Example wet buckle
Discharge location	<i>Commonwealth waters</i>	<i>Commonwealth waters</i>
	<i>Pipeline End Termination Assembly (Approx. KP 433)</i>	<i>Approx KP33</i>
Ave Water depth (m MSL)	941	39.3
Discharge depth (m MSL)	938	39
Disposal of pre-flooding water and cleaning water (treated and filtered seawater)		
Discharge volume (m ³)	254,300	N/A
Discharge duration	~ 11 days	
Disposal of cleaning water only (treated and filtered seawater)		
Discharge volume (m ³)	NA	N/A
Discharge duration		
Approx time between discharges to the environment	7 days	
Disposal of hydrotest squeezed water (treated and filtered seawater)		
Discharge volume (m ³)	3,500	N/A
Discharge duration	~17 hours	
Approx time between discharges to the environment	3 days	
Disposal of hydrotest water and desalination water (treated and filtered seawater / freshwater)		
Discharge volume (m ³)	243,256	19,080
Discharge duration	~22.5 days	~1.39 days

Discharges associated with IMR activities while Trunkline in preservation on seabed

If the trunkline is damaged while in preservation on the seabed following installation (and before the introduction of hydrocarbons), the trunkline may be exposed to raw seawater and/or repair may be required. In this case, integrity of the Trunkline may need to be confirmed through traditional flood, cleaning, gauging and testing (FCGT). If FCGT is used for this purpose, discharges of treated seawater may occur at the location of the Trunkline resection and/or the Pipeline End Termination (PLET, ~KP433). Discharge volume is dependent on the length of Trunkline required to be repaired and as such is comparable to a wet buckle repair.

Water treatment chemicals

Chemicals used to treat seawater and / or freshwater are required for contingent FCGT or wet buckle to ensure the integrity of the Trunkline is not compromised by internal corrosion development. These chemicals are typically comprised of oxygen scavenger, biocide and corrosion inhibitor. Chemicals which may be used are provided Table 6-19. These chemicals are all Hazard Quotient Colour Band 'Gold' (or OCNS Grouping E) with no substitution or product warnings (PS 8.1). Should chemical selection change from those currently planned due to availability or Trunkline material compatibility issues, selected chemicals will meet the required performance standard (PS 8.10) with regard to its OCNS rating.

Table 6-19: Potential chemicals for water treatment

Operation	Option 1	Option 2
Wet Buckle Contingency	RX-202 Oxy Scavenger RX-1236 Biocide	Hydro 3 cocktail
Flood Clean Gauge Test	RX-202 Oxy Scavenger RX-1236 Biocide RX-9026E Clear Dye	Hydro 4 cocktail

Quantitative Risk Assessment

In order to understand the potential impacts and risks associated with the discharge of hydrotest fluid, Woodside commissioned RPS to model the fate and transport of two representative discharge scenarios, one at the PLET and another in Commonwealth waters near the State waters boundary (RPS, 2021). To determine the fate, transport and dilution of the hydrotest discharge, both near-field and far-field modelling was undertaken as these are used to describe different processes and scales of effect. The modelled scenarios included:

- The full trunkline FCGT comprised of
 - Pre-flooding / cleaning water of 254,300 m³
 - Hydrotest / squeeze water of 245,511 m³
- Nearshore wet buckle
 - Cleaning water of 29,000 m³

Note, due to the significantly smaller volumes of treated water discharge (less than 1,200 m³) associated with the wet-buckle philosophy which utilises treated freshwater slugs, no specific modelling was undertaken and the model scenarios above are considered conservative analogues

Stochastic modelling was conducted for this study, which compiled data from 150 hypothetical releases under different environmental conditions and seasons to determine the largest extent of plume dispersion. A three-dimensional, spatially-varying current data set surrounding the discharge locations for a ten-year (2006-2015) hindcast period were used, with summer, winter and transitional seasons modelled. The data set included the combined influence of drift and tidal currents and was suitably long as to be indicative of interannual variability in ocean currents. The current data set was validated against metocean data collected in the Scarborough Project Area.

Results of the replicate simulations were then statistically analysed and mapped to define contours of predicted dilutions.

Development of thresholds for impact assessment

Due to the proposed chemical additives with the hydrotest fluid (i.e., biocides, corrosion inhibitors, oxygen scavenger, fluorescent dyes), the discharges have the potential to impact sensitive receptors within the discharge area of influence, primarily through toxicological effects ranging from the inhibition of key biological processes (e.g., reproduction) to mortality. The outputs of the quantitative modelling are used to assess the environmental risk by delineating which areas of the marine environment could be exposed to chemicals exceeding toxicological threshold concentrations, and the expected time taken for concentrations to reduce to below thresholds.

The 99% species protection level concentration is suggested by the Australian and New Zealand Guidelines for Fresh and Marine Water Quality (ANZG, 2018) for the development of environmental criteria for high conservation ecosystems or chemicals that have a tendency to bioaccumulate. Due to the lack of availability of whole effluent toxicity data for the chemicals in Table 6-20, species protection level concentrations can not be derived. Therefore, the 99% species protection value derived Hydrosure 0-37670R was used as an analogue to interrogate the outputs of the model for the purpose of the impact assessment. Noting that Hydrosure 0-3670R will not be used as it does not meet the required performance standard, with regard to its OCNS rating (PS 8.1).

Chevron Australia Pty Ltd (2015) conducted whole effluent toxicity (WET) testing on Hydrosure 0-3670R (Champion Chemicals Pty Ltd), diluted in seawater. WET testing was undertaken on five locally relevant species, for the NWMR, from four different taxonomic groups based on ANZECC & ARMCANZ (2000). Since Hydrosure 0-3670R is a mixture containing both the biocide and oxygen scavenger for chemical treatment, only one assay in each test species was

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

necessary to evaluate the toxicity of the product. The results of the WET testing are described in Table 6-20. As expected, simpler life forms (e.g. algae and larvae) had a higher sensitivity to the chemical compared to be more complex life forms such as fish. From these results Chevron (2015) developed species sensitivity distribution curves to determine species protection concentrations (Table 6-21).

Table 6-20: Ecotoxicological test results for Hydrosure 0-3670R

Species	Duration (hrs)	NOEC (mg/L)
<i>Nitzschia closterium</i> (Algae)	72	1.30
<i>Saccostrea echinata</i> (Mollusc)	48	0.250
<i>Heliocidaris tuberculata</i> (Echinoderm)	72	1.25
<i>Melita plumulosa</i> (Crustacean)#	96	0.13
<i>Lates calcifer</i> (Fish)#	96	12.5

#toxicity test is defined as an acute test

Table 6-21: Species protection concentrations for Hydrosure 0-3670R

	PC 99% (mg/L)	PC 95% (mg/L)	PC 90% (mg/L)
Hydrosure (based on NOEC)	0.06	0.10	0.15

The results from this study established a 99% species protection value of 0.06 mg/L, which was applied in the modelling over a 48-hr rolling median (Chevron Australia Pty Ltd, 2015). The duration was a conservative approach to account for the fact that the hydrodynamics of the marine environment result in dilution of the chemical concentration after discharge therefore it is unlikely that concentrations would remain elevated for long durations. Therefore, the duration was based on the minimum test duration of 48 hours.

Based on the expected initial concentration of 350 mg/L for pre-flooding and cleaning water and wet buckle discharges, 5,833 dilutions are required. While for an initial concentration of 550 mg/L for hydrotesting, 9,167 dilutions are required to meet threshold concentration at the 99% species protection. Though this likely over represents the residual toxicity of the fluid following discharge as it was assumed that the residual discharge concentration of the chemicals within the fluid is the same as the initial dosing concentration with no degradation or decay during residence within the pipeline.

FCGT – trunkline modelling results

Nearfield modelling results for discharge at the offshore PLET location indicates that a turbulent mixing zone will be created at the seabed, for a horizontal distance of ~90 to 115 m, with a vertical distribution up to 40 m. Outside of this turbulent zone, a positively buoyant plume is expected to rise in the water column, which may reach a horizontal distance of up to ~425 m from the PLET prior to reaching trapping depth.

Farfield modelling for this discharge indicates that dilutions required to reach the threshold concentration (0.06 mg/L) at the 95th percentile (applied as a 48-hour rolling median) for the pre-flooding and cleaning water (additive concentration 350 mg/L) is achieved at a maximum distance of ~6,100 m from the PLET, however on average it is much less and was reached at 600 m (Table 6-22). Similarly, the maximum distance to achieve threshold concentration at 95th percentile (applied as a 48 hr rolling median) for the hydrotest discharges ranges from ~1,400 m (additive concentration 550 mg/L) to ~900 m (additive concentration 350 mg/l) from the PLET. Again, on average, the distances to achieve the threshold concentration were less and ranged from 500 to 600 m. The significantly greater spatial rate of dilution for hydrotest discharge when compared with pre-flood/cleaning is attributed to the lower rate of discharge. Noting that the discharge rate for the pre-flooding and cleaning water is 1000 m³/ hr whereas on average the discharge rate for the hydrotest discharge was ~430 m³/hr.

Table 6-22: Average and maximum distances to achieve the threshold concentration at the 99% and 95% species protection

Scenarios	99% Species Protection		95% Species Protection	
	Average distance	Maximum distance	Average distance	Maximum distance
	Dosage concentration 350 ppb (5833 dilutions)		Dosage concentration 350 ppb (3500 dilutions)	
Pre-flooding / cleaning water of 254,300 m ³ (at 1000 m ³ /hr)	600 m	6.1 km	500 m	4.2 km

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Hydrotest / squeeze water of 245,511 m ³ (at average of ~430 m ³ /hr)	500 m	900 m	300 m	500 m
	Dosage concentration 550 ppb (9167 dilutions)		Dosage concentration 550 ppb (5500 dilutions)	
Hydrotest / squeeze water of 245,511 m ³ (at average of ~430 m ³ /hr)	800 m	1.4 km	400 m	800 m

The maximum time for concentrations to fall below threshold concentration under weak current conditions (resulting in low mixing and low dilution) was 2.77 days. Therefore a minimum time period of 3 days will be applied between pre-flooding/cleaning and hydrotest discharges for the full trunkline FCGT.

KP 33 - wet buckle discharge

Nearfield modelling results for nearshore component discharge adjacent to the State waters boundary indicates that a turbulent mixing zone will be created at the seabed, for a horizontal distance of ~40 m, with vertical distribution around 10 m. Outside of this turbulent zone, a positively buoyant plume is expected to rise in the water column, which may reach a horizontal distance of up to ~60 m from the discharge location prior to reaching trapping depth.

Farfield modelling for this discharge indicates that dilutions required to reach the threshold concentration (0.06 mg/L) at the 95th percentile (applied as a 48-hour rolling median) for the pre-flooding and cleaning water (additive concentration 350 mg/L) is achieved at a maximum distance of ~2100 m from the release location however on average it is much less and was reached at 400 m. This was based on a discharge rate of 1000 m³/hr.

Table 6-23: Average and maximum distances to achieve the threshold concentration at the 99% and 95% species protection

Scenarios	99% Species Protection		95% Species Protection	
	Average distance	Maximum distance	Average distance	Maximum distance
	Dosage concentration 350 ppb (5833 dilutions)		Dosage concentration 350 ppb (3500 dilutions)	
Cleaning water of 29,000 m ³ (at 1000 m ³ /hr)	500 m	2.1 km	200 m	900 m

Dilution contours, representing 150 simulations, for this discharge in context of nearby receptors are shown in Figure 6-6.

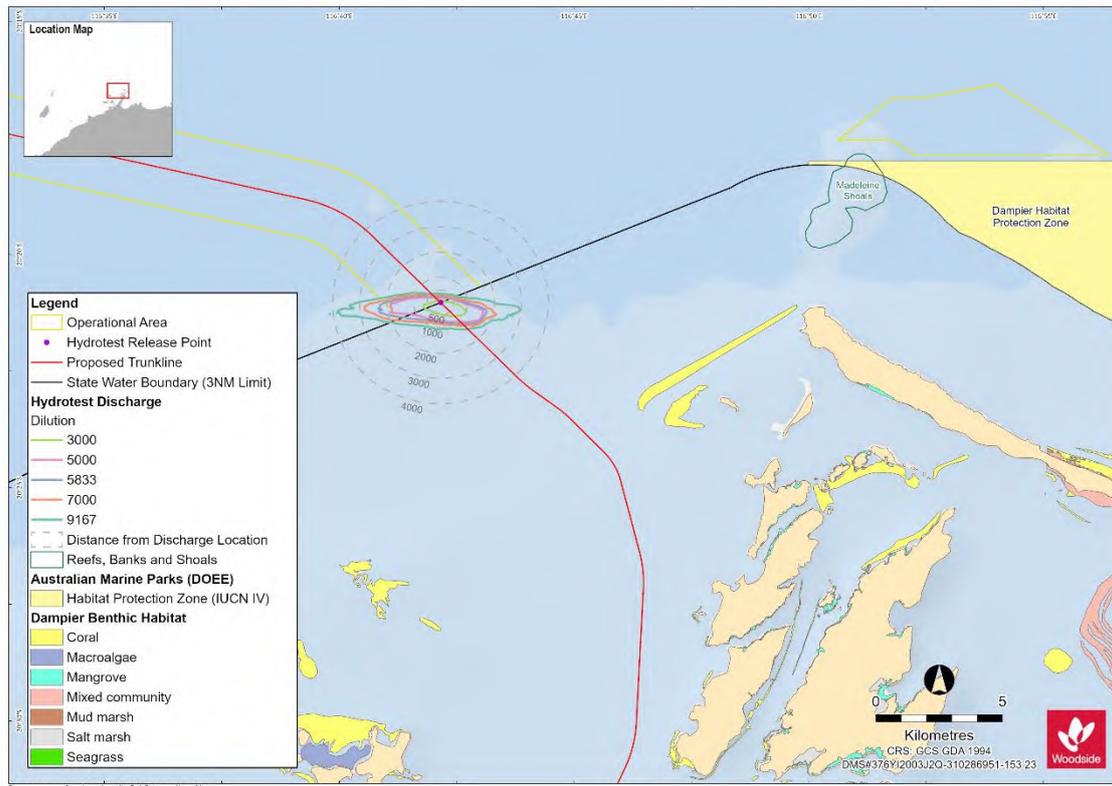

Figure 6-6: Expected dilution contours for a seabed discharge of 29,000 m³ in Commonwealth waters adjacent to the State waters boundary

Detailed Impact Assessment

Assessment of Potential Impacts

Water and Sediment Quality

Background water quality in the NWMR is influenced by large tidal regimes and strong oceanographic currents. Water quality in Trunkline Project Area is likely to be unpolluted tropical offshore environment, nutrient poor and reflects the offshore oceanic conditions of the wider Western Australian region, with the exception of existing disturbances in ports. Similarly, marine sediments are typical of the continental slope in the Northwest Transition bioregion, consisting of soft sandy clay/silt (Section 4.4.3).

Stochastic and deterministic modelling of the FCGT discharge scenarios indicates that chemical concentrations are expected to be below the 99% species protection level within 6,100 m (based on the minimum dilutions), of the PLET, with changes in water quality predicted to return below the threshold value within approximately three days of completing the discharges. A smaller distance may be expected from contingency wet buckle discharges to achieve the required dilutions, in the event of a wet buckle due to the lower discharge rate (~570 m³/hr). Depending on the location of a wet buckle along the trunkline route, chemical concentrations can be expected to drop below the 99% species protection level within a ~1-2 kilometres. This is based on the ~900 m and 2,100 m distances where chemical concentrations are expected to be below the 99% species protection level at the PLET (for hydrotest discharges) and at the state boundary release locations respectively.

The presence of chemical additives in discharged hydrotest fluids are expected degrade, decay, dilute and disperse once released through both dynamic mixing in the nearfield and by prevailing currents in the farfield, due to the open oceanic waters of the Project Area. The discharge is expected to remain close to the seabed which means the temporary change in water quality will be restricted to deep waters at the PLET location and predominantly near seabed at the release location near the State waters boundary. As such, the discharge is expected to result in a temporary decline in water quality around the discharge locations, with no lasting effect on water quality is predicted.

As the discharge plume is expected to remain close to the seabed, a temporary change in sediment quality may occur. However, as demonstrated by the modelling, due to rapid dispersion of the treated seawater, the chemical additives will degrade and dilute rapidly following discharge with no predicted accumulation within seabed sediments and as such no lasting effect on sediment quality is predicted

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Impacts from routine and non-routine discharges of pre-commissioning or installation fluids will have a slight effect on water and sediment quality. There are no variations in seasonal sensitivity in relation to water and sediment quality that would influence the effect of the discharge. Receptor sensitivity is low (low value, open water), and therefore Impact Significant Level of routine and contingent discharges of pre-commissioning or installation fluids on water quality and sediment quality is negligible.

Plankton

A change in water quality has the potential to result in the injury or mortality of planktonic species in the water column due to toxicity. Ichthyoplankton (eggs, larvae) are the most susceptible organisms to chemical exposure, as they have limited mobility and thus likely to be exposed to the plume if present. These organisms however, have a high natural mortality and rapid replacement rate and are therefore likely to recover after activity ceases.

Stochastic and deterministic modelling of the FCGT discharge scenarios indicates that chemical additive concentrations are expected to be below the 99% species protection level within 6,100 m with changes in water quality predicted to return below the threshold value within approximately three days of completing the discharges. As described above, chemical concentrations resulting from a wet buckle discharge can be expected to drop below the 99% species protection level within a ~1-2 kilometres of the discharge location.

Treated seawater discharge in the unlikely event of full Trunkline FCGT or wet buckle discharge in deeper waters will occur close to the seafloor in water depths of about ~940 m at the PLET location. Given phytoplankton and zooplankton are generally limited to near-surface waters (i.e., the photic and meso-photoc zones) no lasting effect on plankton is expected.

Plankton populations may be affected by a wet buckle discharge along the trunkline route in the shallower waters of the continental Shelf within a limited area (~1-2 km) of the discharge location. However, given the expected rapid dispersion and dilution of the plume by prevailing currents and the temporary nature of the discharge, impacts to plankton are likely to only occur in the immediate area of the discharge plume, over a period of days to weeks. Given the fast population turnover of open water plankton populations (ITOPF, 2011), the potential impacts are expected to be localised and temporary.

Discharges during pipelay or pre-commissioning or installation activities will be restricted to a small area around the discharge point and will disperse rapidly in the environment. Impacts from contingent treated seawater discharges will have no lasting effect on plankton.

Epifauna and infauna

As a result of a change in sediment or water quality, impacts to benthic habitat receptors may occur. This may include sub-lethal effects or mortality to benthic epifauna and infauna resulting from the increased (water) or accumulation of (sediment) potential contaminants and toxins. Epifauna and infauna sensitivity to dewatering discharges is expected to be similar to pelagic invertebrate species such as plankton.

Discharges during pre-commissioning will therefore be restricted to a relatively small area around the discharge point and will disperse rapidly in the environment. The extent of seabed exposure at levels where impacts could occur will be small, and potential impacts are expected to be localised, temporary and negligible. Impacts from contingent treated seawater discharges will have no lasting effect on epifauna and infauna. Receptor sensitivity of epifauna and infauna is considered low at the possible FCGT discharge location. The Impact Significance Level of an FCGT/hydrotest discharge on epifauna and infauna has therefore been identified as Negligible (F). There are no variations in seasonal sensitivity in relation to epifauna and infauna that would influence the effect of the discharges.

Stochastic and deterministic modelling of a wet buckle discharge near the State waters boundary indicates that chemical additive concentrations are expected to be below the 95% species protection within 900 m and below the 99% species protection threshold within 2.1 km of the discharge location. Therefore, there is potential for a small, localised area of epifauna to be exposed to lethal and sub-lethal concentrations near the release location. Due to rapid dispersion of the treated seawater, uptake and bioaccumulation of contaminants is not expected to occur in sediments or benthic organisms beyond the point of release.

In the event of a wet buckle along the trunkline route chemical concentrations resulting from discharge of treated seawater can be expected to drop below the 99% species protection level between ~1-2 km as described above, depending on the location of the discharge along the trunkline route. Section 4.5.2 describes benthic habitats and communities along the trunkline. The seabed along the trunkline route is generally featureless with occasional areas of hard substrate that may support patches of benthic filter feeder communities. Within the Montebello AMP (KP 109 and KP 192) soft sediment habitats predominate, with calcarenite outcrops supporting sponges, whips and gorgonians. Denser areas of filter feeders also occur in areas with more complex seabed structure. These areas of filter feeding benthos (sponges, soft corals, gorgonians, hydroids, sea pens, crinoids) are widely representative of benthos found both within the AMP (Advisian, 2019a) and regionally (potential impacts to the values of the AMP are evaluated further in the AMP section below). Rock pinnacles have been observed approximately 360 m south of the trunkline at KP 206 as shown in Figure 4-7. The pinnacles are isolated forms restricted to an area about 100 m long x 75 m wide, and do not constitute continuous reef. The structures provide habitat for a diverse range of epifaunal and demersal species that commonly occur across the NWMR, including a very low percentage cover of soft coral growing on top of the pinnacles. It is not possible to predict where a wet buckle could occur. In the unlikely event a wet buckle discharge is required along the trunkline route in proximity to the more complex benthic habitats described (e.g. within the Montebello AMP or near the rock pinnacles), the extent of seabed exposure at levels where impacts could occur will be small and likely

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

limited to within 100s of metres of the discharge location. Potential impacts will be localised and temporary as the one-off discharge disperses rapidly within the water column. While a diverse range of epifaunal and demersal species are reported to be associated with these habitats, they commonly occur across the NWMR. Receptor sensitivity of epifauna and infauna is considered low to medium along the trunkline route. The Impact Significance Level of a wet buckle discharge on epifauna and infauna has therefore been identified as Slight (E). There are no variations in seasonal sensitivity in relation to epifauna and infauna that would influence the effect of the discharges.

Marine mammals, Fish (Pelagic and Demersal) and Marine reptiles

Marine fauna could pass through the plume however exposure would be at low concentrations and short duration. The 99% species protection threshold and the subsequent mixing zone have been determined through the application of chronic exposure ecotoxicological tests on sensitive life stage marine fauna. The toxicity of the water treatment chemicals is less on larger life forms as demonstrated by the WET testing (Table 6-20) which determined that the NOEC for a fish species was 12.5 mg/L. Modelling predicted that this would occur out to a maximum of 30 m from the release location. In addition, marine fauna are transient and as such are unlikely to be exposed to sufficient concentrations or durations of the discharge constituents to elicit a response.

The location of the FCGT discharge at the PLET does not overlap any BIAs for protected marine fauna and given the water depth (about ~940 m), toxicity and temporary nature of the discharge, impacts to protected species are not expected. The deep water and predominantly featureless, flat soft sediment seabed at the PLET discharge location is of low complexity and low productivity (see Section 4.5) and reduces the species diversity and richness of pelagic and demersal fish assemblages. Although sporadic upwelling events and increased primary productivity along the along the northern and southern boundaries of the Exmouth Plateau KEF may temporarily increase fish diversity, overall, fish fauna is not expected to be abundant at the FCGT discharge location, which is located >50 km from the periphery of the plateau. Continental slope fish communities off the west coast of Australia (including the Exmouth Plateau) have a low overall density, which appears to be linked to the low biological productivity of the overlying waters (Williams et al., 2001). Based on the low likelihood of pelagic species being exposed to the discharge; the ability of fish to move away from the discharge plume and the potential for toxic impacts to occur from contingent treated seawater discharge potential impacts are considered to be localised and short-term with no lasting effect at the population or bioregional scale.

Fish are perhaps most susceptible in their early life stages, particularly during egg and planktonic larval stages. Six key indicator commercial fish, and spawning depth ranges / seasonality, on the NWS are as follows:

- red emperor – depth range 10–180 m, spawns Sept–June (bimodal peaks Sept–Nov and Jan–Mar);
- Rankin cod – depth range 10–150 m, spawns June–Dec and Mar (peak Aug–Oct);
- goldband snapper – depth range 50–200 m, spawns Oct–May;
- bluespotted emperor – depth range 5–110 m, spawns Jul–Mar;
- ruby snapper – depth range 150–480 m, spawns Dec–Apr (peak Jan–Mar); and
- Spanish mackerel – depth range 1 m to at least 50 m, spawns Sept–Jan.

The Operational Area overlaps the depth ranges for these key indicator commercial fish species, and the timing of activities means that there would be overlap with peak spawning periods for a number of these species. However, it is believed that all of these species undergo group spawning throughout their range, rather than aggregating at specific locations. Therefore, that treated seawater is discharged impacts to fish spawn would be limited to a localised area around the discharge location and not expected to have a substantial adverse effect on the population.

In the event of a wet buckle, discharge volumes of treated seawater will be limited to the length of pipeline requiring dewatering and will similarly result in a temporary reduction in water quality with negligible effect to protected fauna. In the unlikely event of a wet buckle discharge located in the humpback whale migration BIA, pygmy blue whale migration BIA or interneresting BIAs and Habitat Critical for a number of marine turtle species, during the migration / nesting season, potential impacts to protected marine fauna are highly unlikely given the potential toxicity, temporary nature of the discharge and transient nature of marine fauna.

Stochastic and deterministic modelling indicates that potential impacts to protected marine fauna, as well as pelagic or demersal fish species from wet pre-commissioning discharges or wet buckle contingency discharges, are expected to be confined to the vicinity of discharge point.

KEFs

The FCGT discharge location at the PLET occurs within the Exmouth Plateau KEF. The Exmouth Plateau is defined as a KEF as it is a unique seafloor feature with ecological properties of regional significance, which apply to both the benthic and pelagic habitats within the feature. Therefore, as a result of a change in sediment quality and/or water quality, potential impacts to this KEF may occur. Values of the Exmouth Plateau with the potential to be affected by dewatering is limited to impacts to benthic environments containing low habitat heterogeneity within the plume. There is no solids component in the discharge, and therefore no smothering or alteration of the seabed is expected to occur.

The seafloor composition within the area of the dewatering discharge is expected to primarily be mud and clay material. Survey of the plume area identified the seafloor to contain sparse marine life dominated by motile taxa typical of deep-water soft substrates (ERM, 2013; DEWHA, 2008).

The Trunkline Project Area has a minor overlap with the Continental Slope Demersal Fish Communities KEF at ~KP 200 for about 9 km (<0.05% overlap), and with the Ancient Coastline at 125 m depth contour KEF at ~KP190 for about 3 km (0.03% overlap). The Ancient Coastline KEF includes areas of hard substrate, and higher diversity and species richness relative to surrounding areas of predominantly soft sediment. The submerged coastline may facilitate mixing of the water column enhancing productivity. Combined with greater diversity of sessile benthic organisms, this may increase abundance of pelagic species such as fishes and cetaceans, impacts to which are discussed above. The Continental Slope Demersal Fish Communities KEF represents high levels of endemism of demersal fish species. Based on the assessment above, in the unlikely event of a wet buckle discharge within a KEF, potential impacts to the values of the KEF would be highly localised to the Trunkline Project Area and temporary in nature as the treated seawater disperses within the water column.

Impacts from contingent discharges of treated seawater will have no lasting effect on KEFs.

AMPs

There is potential for wet buckle contingency discharges to occur as the trunkline is laid within the Montebello Marine Park. The maximum discharge volume would be ~210,000 m³ based on the trunkline length at KP 190. As described above, chemical concentrations resulting from a wet buckle discharge can be expected to drop below the 99% species protection level within ~1-2 km of the discharge location. The North-west Marine Parks Network Management Plan (DNP, 2018a) lists the natural values of the Montebello AMP as including a range of threatened, migratory, marine or cetacean species listed under the EPBC Act. Potential impacts to benthic communities and marine fauna are assessed above. Impacts are predicted to have no lasting effect due to the one-off nature of the discharge and rapid dispersion of the treated seawater. Even if more than one wet buckle event was to occur in the AMP there is no potential for cumulative impact given the chemical additives will degrade and dilute rapidly following discharge, with no predicted accumulation within seabed sediments. Potential impacts to the natural values of the AMP, and intrinsically linked cultural values, are to be a magnitude of 'no lasting effect'.

For activities occurring within the Montebello Marine Park, the short-term and localised impacts of routine and non-routine discharges in open waters will not be inconsistent with the values and objective of the Multiple Use Zone (VI) to provide for ecologically sustainable use and the conservation of ecosystems, habitats and native species. Impacts are therefore not inconsistent with the objectives of the North-west Marine Parks Network Management Plan or the zoning of the Montebello and Dampier AMPs (DNP, 2018a).

Changes to the functions, interests or activities of other users

The NWSTF is the only Commonwealth-managed fishery expected to be active within the PLET discharge location. Given the water depth of the full Trunkline discharge location (about 1400 m) and the temporary nature and rapid dilution of the discharge, impacts from the discharge of treated seawater such as changes to the functions, interest or activities of Commonwealth are unlikely.

Similarly, wet buckle discharge near the State waters boundary overlaps the State-managed fisheries, however given the rapid dilution of the discharge and hence duration of exposure, impacts are considered unlikely. In the event of a wet buckle, the dispersal of dewatering fluids is likely to be temporary and disperse rapidly in the water column.

In general, given the oceanic locations and the localised and temporary nature of the contingent treated seawater discharges, exposure to fisheries is considered negligible.

Summary of Assessment Outcomes				
Receptor	Impact	Receptor Sensitivity Level	Magnitude	Impact Significance Level / Risk Consequence
Water quality	Change in water quality	Low value (open water)	Slight	Negligible (F)
Sediment quality	Change in sediment quality	Low value (open water)	Slight	Negligible (F)
Plankton	Injury/ mortality to fauna	Low value (open water)	No Lasting Effect	Negligible (F)
Epifauna and Infauna	Injury / mortality to fauna	Low value (open water)	No Lasting Effect	Negligible (F)
Fish	Injury/mortality or behavioural changes to marine fauna	High value species	No lasting effect	Slight (E)
Marine Mammals		High value species	No lasting effect	Slight (E)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Marine Reptiles		High value species	No lasting effect	Slight (E)
KEFs	Change in habitat	High value habitat	No lasting effect	Slight (E)
AMP	Injury or behavioural changes to marine fauna	High value	No lasting effect	Slight (E)

Overall Impact Significance Level: The overall impact significance level for routine and non-routine discharges from pre-commissioning and pipelay activities is E based on slight effect to high value receptors (marine fauna). The impact significance levels for water quality is consistent with those rated in the Scarborough OPP. This impact assessment assumes worst case seasonality (i.e. presence of fauna during migratory or breeding periods for example) and sensitive localities and is thus a conservative approach. Contingent trunkline discharges that occur outside of sensitive receptor localities and seasonalities will result in a lower impact potential. Potential impacts to marine fauna and the Montebello AMP have been additionally assessed in this EP. There is no change in magnitude of impact (no lasting effect).

No wet buckle discharge in the Montebello Multiple Use Zone	F: No. Not feasible due to nature of a wet buckle i.e. it is an unplanned event that results in seawater ingress into the Trunkline during installation as a result of an incident. There is no ability to keep laying or move the existing line out of the MUZ. The need to remove seawater from the line is urgent to reduce likelihood of future integrity issues. CS: Not considered, control not feasible.	Not considered – control not feasible	Not considered –Control not feasible	No
No contingent FCGT / wet pre-commissioning discharges near the State Waters Boundary	F: Yes CS: Financial / timing costs of alternative integrity testing options for the shore crossing / nearshore section of Trunkline should it be required for the Trunkline Safety Case.	Not carrying out FCGT / wet pre-commissioning discharges in more sensitive receptor environments such as ~KP 33 (in the humpback whale migration BIA, as well as in interesting BIAs and Habitat Critical for a number of marine turtle species) can reduce impact potential, particularly during important seasonal events such as migration and nesting.	Benefits outweigh cost/sacrifice.	Control incorporated into contingent wet testing activity design.

Professional Judgement – Substitute

No additional controls identified

Professional Judgement – Engineered Solutions

No additional controls identified.

ALARP Statement:

On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.3.3), Woodside considers the adopted controls appropriate to manage the impacts of FCGT fluid discharges. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts and risks are considered ALARP.

Demonstration of Acceptability
<p>Acceptability Criteria and Assessment</p> <p>The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5):</p> <ul style="list-style-type: none"> Overall impact significance level for water quality is consistent with the level rated in the Scarborough OPP. As discussed above, potential impacts to marine fauna have been additionally assessed in this EP. There is no change in magnitude of impact (no lasting effect); however, the impact significance level is slightly higher due to the higher receptor sensitivity level. This is not considered a significant change to the overall environmental impact and risk assessed in the Scarborough OPP. EPOs and controls in the Scarborough OPP that are relevant to routine and non-routine discharges have been adopted. There are no changes to internal/external context specific to this risk from the Scarborough OPP. Impacts from discharges during trunkline installation and pre-commissioning was raised during stakeholder consultation (Appendix F, Table 1) <p>Acceptability Statement:</p> <p>The impact assessment has determined that, given the adopted controls, pre-commissioning and pipelay discharges are unlikely to result in an impact significance level greater than Slight. A number of BIAs for EPBC Act listed Threatened or Migratory species overlap the Trunkline Project Area, although no BIAs overlap the location of FCGT discharge at the PLET (refer to Section 4.6). The adopted controls are considered consistent with industry legislation, codes and standards, and professional judgement and meet the requirements of Australian Marine Orders.</p> <p>The potential impacts are considered broadly acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts of these discharges to a level that is broadly acceptable.</p>

6.8 Unplanned Activities (Accidents, Incidents, Emergency Situations)

6.8.1 Quantitative Spill Risk Assessment Methodology

Quantitative hydrocarbon spill modelling was performed by RPS (RPS, 2019, 2021), on behalf of Woodside, using a three-dimensional hydrocarbon spill trajectory and weathering model, SIMAP (Spill Impact Mapping and Analysis Program). The model is designed to simulate the transport, spreading and weathering of specific hydrocarbon types under different environmental conditions (both meteorological and oceanographic). Near-field subsurface discharge modelling was performed using OILMAP, which predicts the droplet sizes that are generated by the turbulence of the discharge as well as the centreline velocity, buoyancy, width and trapping depth (if any) of the rising gas and oil plumes. The OILMAP output parameters were used as input into SIMAP.

The algorithms in the SIMAP model are based on the best available scientific knowledge and are updated when necessary in response to significant advances in knowledge. Recent improvements have been implemented to the entrainment algorithm, which have been adjusted to implement the findings of published data based on field research performed during the Macondo spill event in the Gulf of Mexico (Spaulding et al., 2017; Li et al., 2017; French-McCay et al., 2018).

Stochastic modelling was conducted for this study, which compiled data from 200 hypothetical spills, at three locations, under different environmental conditions to determine the widest extent of possible oil dispersion. The environmental conditions for each of the hypothetical spills were selected randomly from an historic time-series of wind and current data representative of the study area. Results of the replicate simulations were then statistically analysed and mapped to define contours of percentage probability of contact at identified thresholds around the hydrocarbon release point.

The model simulates surface releases and uses the unique physical and chemical properties of a representative hydrocarbon type to calculate rates of evaporation and viscosity change, including the tendency to form oil-in-water emulsions. Moreover, the unique transport and dispersion of surface slicks and in-water components (entrained and dissolved) are modelled separately. Thus, the model can be used to understand the wider potential consequences of a spill, including direct contact of hydrocarbons due to surface slicks (floating hydrocarbon) and exposure of organisms to entrained and dissolved aromatic hydrocarbons in the water column. The model also calculates the accumulation of hydrocarbon mass that arrives on each section of shoreline over time, taking into account any mass that is lost to evaporation and/or subsequent removal by current and wind forces.

All hydrocarbons spill modelling assessments performed by RPS undergo initial sensitivity modelling to determine appropriate time to add to the simulation after the cessation of the spill. The amount of time following the spill is based on the time required for the modelled concentrations to practically drop below threshold concentrations anywhere in the model domain in the test cases.

In addition to the stochastic modelling, single-trajectory modelling (deterministic) was performed to assess potential worst-case trajectories based on the stochastic modelling runs. The deterministic simulations are therefore representative of single spill events under certain wind and current conditions. The deterministic simulations were performed to represent the fastest time to shoreline contact and the largest volume ashore from a single model run.

6.8.1.1 Worse Case Scenarios

In assessing the potential impacts of an unplanned hydrocarbon release, representative worst-case scenarios (in terms of volume and location) were assessed. A summary of the credible hydrocarbon spill scenarios that could occur during the Petroleum Activities Program are provided in Table 6-24.

Table 6-24: Credible hydrocarbon spill scenarios

Scenario		Hydrocarbon type	Maximum credible volume	Location
1	Hydrocarbon release due to vessel collision. Refuelling tanker or PV is governing scenario.	Marine diesel	2000 m ³	Any location within Operational Area
2	Bunkering loss of containment. Hose failure is governing scenario.	Marine diesel	55 m ³	Within Operational Area
3	Release from onboard equipment. PV HPU is governing scenario.	Hydraulic fluid	8 m ³	Within Operational Area

For the Petroleum Activities Program, the worst-case scenario was identified to be an instantaneous surface release of 2,000 m³ of marine diesel, representing loss of the largest vessel fuel tank integrity (construction vessel) following a collision. As the worst-case scenario, the assessment of impacts will also address the potential impacts of other credible lesser releases.

To inform the impact assessment, quantitative hydrocarbon spill modelling was undertaken for the worst-case hydrocarbon release scenario (RPS, 2019, 2021).

It is not practicable for spill modelling to be undertaken at every potential release location within the Operational Area. Release locations were selected by considering locations that would:

- have the greatest potential environmental consequence to the receiving environment (closest to sensitive receptors) and / or
- be considered at greater risk of a spill event.

Accordingly, a release of marine diesel was modelled at three representative locations; two along the trunkline at sensitive locations, and one at the end of the trunkline (FPU) (Table 6-25), these are also shown in Figure 4-1. The Hydrocarbon EMBA has been defined using a combination of all three locations.

Table 6-25: Spill locations for 2000 m³ marine diesel instantaneous release

Location	Coordinates	Water Depth
Location 1: Outside Mermaid Sound	20° 21' 3.28" S, 116° 42' 5.58" E	31 m
Location 2: Within the Montebello Australian Marine Park	20° 03' 1.44" S, 115° 31' 35.04" E	74 m
Location 3: FPU / end of trunkline	19° 53' 54.72" S; 113° 14' 19.56" E	930 m

6.8.1.2 Hydrocarbon Characteristics

Marine diesel is characterised by a large mixture of low- and semi- to low-volatile compounds (95%) and persistent hydrocarbons (5%). Additionally, marine diesel typically contains less than 3% aromatic hydrocarbons that could potentially dissolve in the water column. MDO has been selected for modelling as it represents a worst case outcome; vessels as part of the Petroleum Activities Program will not use HFO or IFO.

Table 6-26 summarises hydrocarbon characteristics of marine diesel.

Table 6-26: Characteristics of marine diesel

Physical Properties	Result
Density (kg/m ³)	829 (at 25 °C)
American Petroleum Institute (API)	37.2

Physical Properties	Result
Dynamic viscosity (centipoises; cP)	4 (at 25 °C)
Pour Point (°C)	-7
Gas to condensate ratio (bbl/MMscf)	N/A
Oil Property Category	II
Oil Persistence Classification	Non-persistent

6.8.1.3 Environment that May Be Affected and Hydrocarbon Contact Thresholds

The outputs of the quantitative hydrocarbon spill modelling are used to assess the environmental risk, if a credible hydrocarbon spill scenario occurred, by delineating which areas of the marine environment could be exposed to hydrocarbon levels exceeding hydrocarbon threshold concentrations.

The summary of all the locations where hydrocarbon thresholds could be exceeded by any of the simulations modelled is defined as the Hydrocarbon EMBA which is driven by the worst-case credible hydrocarbon spill scenario, which in this instance is the loss of 2000 m² (modelled volume) in the event of a vessel collision resulting in a fuel tank rupture. As described in Section 4.1, the Hydrocarbon EMBA also is used to define the EMBA (Figure 4-1), which includes the dredging Zone of Influence (Section 6.7.2). The Hydrocarbon EMBA has been defined using a combination of all three modelling locations.

As the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, the Hydrocarbon EMBA combines the potential spatial extent of the different fates. It is noted that the hydrocarbon thresholds used to define the EMBA for this Petroleum Activities Program are more conservative than the thresholds adopted in the Scarborough OPP (SA0006AF0000002, Rev 5, Section 7.2.6). Consequently, the EMBA for this activity is larger than the EMBA defined in the Scarborough OPP.

The Hydrocarbon EMBA covers a larger area than the area that is likely to be affected during any single spill event, as the model was run for a variety of weather and metocean conditions (100-200 simulations in total). The Hydrocarbon EMBA therefore represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs.

Surface and accumulated shoreline hydrocarbon concentrations are expressed as grams per square metre (g/m²), with entrained and dissolved aromatic hydrocarbon concentrations expressed as parts per billion (ppb). A conservative approach adopting accepted contact thresholds that are documented to impact the marine environment are used to define the Hydrocarbon EMBA. These hydrocarbon thresholds are presented in Table 6-27 and described in the following subsections.

Woodside recognises that hydrocarbons may be visible beyond the Hydrocarbon EMBA at lower concentrations than the ecological impact thresholds defined in Table 6-27. The threshold for visible surface oil (1 g/m²) has therefore been used to define an additional boundary within which socio-cultural impacts to the visual amenity of the marine environment may occur. This area is referred to as the socio-cultural EMBA. Any ecological impacts from dissolved and entrained hydrocarbons above prescribed thresholds, as in Table 6-27, may also result in socio-cultural impacts. Potential impacts to socio-cultural values assessed within these EMBA's include:

- protected areas
- national and Commonwealth Heritage Listed places
- tourism and recreation
- fisheries.

Table 6-27: Summary of environmental impact thresholds applied to the quantitative hydrocarbon spill risk modelling results

Hydrocarbon Type	EMBA				Socio-cultural EMBA
	Surface Hydrocarbon (g/m ²)	Entrained hydrocarbon (ppb)*	Dissolved aromatic hydrocarbon (ppb)*	Accumulated hydrocarbon (g/m ²)	Surface Hydrocarbon (g/m ²)
Marine Diesel	10	100	50	100	1

* Hydrocarbon thresholds used to define the EMBA for this Petroleum Activities Program are more conservative than the thresholds adopted in the Scarborough OPP (SA0006AF0000002, Rev 5, Section 7.2.6). Consequently, the EMBA for this activity is larger than the EMBA defined in the Scarborough OPP.

6.8.1.4 Surface Hydrocarbon Threshold Concentrations

The spill modelling outputs defined the EMBA for surface hydrocarbons resulting from a spill (contact on surface waters) using a threshold of ≥ 10 g/m² for diesel. This is equivalent to dull metallic colours based on the relationship between film thickness and appearance (Bonn Agreement, 2015) (Table 6-28). This threshold concentration is geared towards informing potential oiling impacts for wildlife groups and habitats that may break through the surface slick from the water or the air (for example: emergent reefs, vegetation in the littoral zone and air-breathing marine reptiles, cetaceans, seabirds and migratory shorebirds).

Thresholds for registering biological impacts resulting from contact of surface slicks have been estimated by different researchers at about 10 to 25 g/m² (French et al., 1999; Koops et al., 2004; NOAA, 1996). Potential impacts of surface slick concentrations in this range for floating hydrocarbons may include harm to seabirds through ingestion from preening contaminated feathers, or the loss of the thermal protection of their feathers. The 10 g/m² threshold is the reported level of oiling to instigate impacts to seabirds and is also applied to other wildlife, though it is recognised that ‘unfurred’ animals, where hydrocarbon adherence is less, may be less vulnerable. ‘Oiling’ at this threshold is taken to be of a magnitude that can cause a response to the most vulnerable wildlife such as seabirds. Due to weathering processes, surface hydrocarbons will have a lower toxicity due to change in their composition over time. Potential impacts to shoreline sensitive receptors may be markedly reduced in instances where there is extended duration until contact. The 10 g/m² threshold is considered appropriate for diesel delineating potential chronic and acute effects to ecosystems.

A lower concentration of 1 g/m², which represents a rainbow sheen on the surface (Table 6-28), has also been used to define a wider area within which socio-cultural impacts to the visual amenity of the marine environment may occur. This wider area is referred to as the ‘socio-cultural EMBA’.

Table 6-28: The Bonn Agreement oil appearance code

Appearance (following Bonn visibility descriptors)	Mass per area (g/m ²)	Thickness (µm)	Volume per area (L/km ²)
Discontinuous true oil colours	50 to 200	50 to 200	50,000 to 200,000
Dull metallic colours	5 to 50	5 to 50	5000 to 50,000
Rainbow sheen	0.30 to 5.00	0.30 to 5.00	300 to 5000
Silver sheen	0.04 to 0.30	0.04 to 0.30	40 to 300

6.8.1.5 Accumulated Hydrocarbon Threshold Concentrations

Owens and Sergy (1994) define accumulated hydrocarbon <100 g/m² to have an appearance of a stain on shorelines. French-McCay (2009) defines accumulated hydrocarbons ≥ 100 g/m² to be the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

living in intertidal habitat. A threshold of ≥ 100 g/m² has been adopted as the threshold for shoreline accumulation and has been included in the EMBA. Further, any ecological impacts at the shoreline accumulation threshold may also result in socio-cultural impacts.

6.8.1.6 Dissolved Aromatic Hydrocarbon Threshold Concentrations

Dissolved hydrocarbons present a narcotic effect resulting from uptake into the tissues of marine organisms. This effect is additive, increasing with exposure concentration or with time of exposure (French-McCay, 2002; NRC, 2005). The dissolved aromatic threshold of 50 ppb has been selected as a medium level threshold to approximate the potential toxic effects, particularly sublethal effects to sensitive species, as consistent with the NOPSEMA Oil Spill Modelling Guidance Bulletin (NOPSEMA, 2019).

6.8.1.7 Entrained Hydrocarbon Threshold Concentrations

Entrained hydrocarbons present a number of possible mechanisms for toxic exposure to marine organisms. The entrained hydrocarbon droplets may contain soluble compounds, hence have the potential for generating elevated concentrations of dissolved aromatic hydrocarbons (e.g., if mixed by breaking waves against a shoreline). Physical and chemical effects of the entrained hydrocarbon droplets have also been demonstrated through direct contact with organisms; for example, through physical coating of gills and body surfaces, and accidental ingestion (National Research Council, 2005).

The entrained threshold has been selected to be consistent with the NOPSEMA Oil Spill Modelling Guidance Bulletin (NOPSEMA, 2019). An entrained threshold of 100 ppb is considered to be appropriate given the oil characteristics for informing potential impacts to receptors.

This threshold is used to define an area within which ecological impacts to the marine environment may occur from entrained hydrocarbons. Therefore, it may also be associated with socio-cultural impacts.

6.8.1.8 Scientific Monitoring

A planning area for scientific monitoring is also described in Section 5.7 of the Oil Spill Preparedness and Response Mitigation Assessment (Appendix D). This planning area has been set with reference to the low exposure entrained value of 10 ppb detailed in NOPSEMA Bulletin #1 Oil Spill Modelling (2019).

A scientific monitoring program would be activated following a Level 2 or 3 unplanned marine diesel release, or any release event with the potential to contact sensitive environmental receptors. This would consider receptors at risk (ecological and socio-economic) for the entire predicted EMBA and in particular, any identified Pre-emptive Baseline Areas (PBAs) for the worst-case credible spill scenario(s) or other identified unplanned hydrocarbon releases associated with the operational activities.

contamination occurred. The second 2010 vessel collision involved a vessel under pilot control in port connected with a vessel alongside a wharf causing it to sink. No reported contamination resulted from the sunken vessel. These incidents demonstrate the likelihood of only minor volumes of hydrocarbons being released during the highly unlikely event of a vessel collision occurring.

From 2010 to 2011, the ATSB's annual publication defines the individual safety action factors identified in marine accidents and incidents: 42% related to navigation action (2011). Of those, 15% related to poor communication and 42% related to poor monitoring, checking and documentation. The majority of these related to the grounding instances.

Credible Scenario

For a vessel collision to result in the worst-case scenario of a hydrocarbon spill potentially impacting an environmental receptor, several factors must align as follows:

- The identified causes of vessel interaction must result in a collision.
- The collision must have enough force to penetrate the vessel hull.
- The collision must be in the exact location of the fuel tank.
- The fuel tank must be full, or at least of volume which is higher than the point of penetration.

The environmental risk analysis and evaluation undertaken identified and assessed a range of potential scenarios that could result in a loss of vessel structural integrity resulting in damage to fuel storage tank(s) and a loss of marine diesel to the marine environment (Table 6-24). The scenarios considered damage to single and multiple fuel storage tanks in the vessel due to various combinations of vessel to vessel collisions. In summary:

- It is not a credible scenario that the total storage volume of the project vessel would be lost, as fuel is stored in more than one tank. Credible spill volumes are calculated as per AMSA recommendations (AMSA, 2015)
- It is highly unlikely that the full volume of the largest storage tank on a project vessel would be lost.

A collision between a project vessel with a third party vessel (i.e., commercial shipping/fisheries) at any location within the Operational Area was assessed as being credible. However, this is highly unlikely given the standard vessel operations and equipment in place to prevent collision at sea, the short duration of activities in the Operational Area, the typical low speeds of vessels undertaking the Petroleum Activities Program and the construction and placement of storage tanks. Potential spill volumes for this scenario are summarised in Table 6-29.

A collision between project vessels within the Petroleum Activities Program was considered credible, however it is not credible that the collision would meet the loss of containment conditions listed above (i.e., vessel speed, location etc.) to cause a failure of fuel storage tank(s).

Given the offshore location and depths within the Operational Area, vessel grounding is not considered a credible risk.

Table 6-29: Summary of credible hydrocarbon spill scenario as a result of vessel collision

Scenario	Hydrocarbon Volumes	Preventative and Mitigation Controls	Credibility
Loss of containment from a project vessel resulting from a collision with the PV (or two vessels operating within the Petroleum Activities Program)	Largest worst-case volume of a single tank is 2000 m ³ . This is representative of either a refuelling tanker or the PV, and the largest fuel tank of all other vessels is expected to be smaller than this.	Operational procedures and practises such as reduced vessel speeds in proximity to the PV, SIMOPS plans where different work scopes operating near each other and validation of vessel master/crew competency and training.	Not Credible. While collision between project vessels is credible, such as a bunkering vessel with the PV, it is not credible that the collision would be of sufficient energy to cause fuel tank rupture and result in a loss of containment.
Loss of containment from a project vessel (as described in Section 3) resulting from a collision with a third-party vessel.	Largest worst-case volume of a single tank is 2000 m ³ . This is representative of either a refuelling tanker or the PV, and the largest fuel tank of all other vessels is expected to be smaller than this.	Typically double wall, tanks which are located mid-ship (not bow or stern). Vessels are not anchored (with the possible exception of the SWLB) and move at low speeds when relocating within the Operational Areas or providing stand-by cover. Normal maritime procedures would apply during such vessel movements.	Credible Project vessel – third party vessel collision could potentially result in the release from a fuel tank.

Quantitative Hydrocarbon Risk Assessment

Modelling of a 2000 m³ surface release of marine diesel was undertaken for three locations within the Trunkline Project Area (refer to Table 6-25 for a summary of spill release locations) (RPS 2019, 2021).

The modelling assessed the extent of a marine diesel spill volume of 2000 m³ for all seasons, using an historic sample of wind and current data for the region. The modelling was conducted by RPS using a three-dimensional hydrocarbon spill trajectory and weathering model, updated in 2021 (SIMAP, Spill Impact Mapping and Analysis Program) (RPS, 2019, 2021). The model ran 100-200 annualised spill trajectories, varying the start time (and hence prevailing wind and current conditions). This approach ensures that the predicted transport and weathering of a hydrocarbon slick is subjected to a range of oceanic conditions.

Hydrocarbon Characteristics

MDO is a non-persistent fuel oil and contains a small proportion of heavy components (or low volatile components) that tend to physically entrain into the upper water column in the presence of moderate winds (i.e. >12 knots) and breaking waves but may re-float to the surface if these conditions abate. In the event of a substantial spill, the heavier components can remain entrained or remain on the sea surface for an extended period. The characteristics of the marine diesel are given in Table 6-30.

When spilled into the warm tropical and subtropical marine environment expected, MDO spreads rapidly and forms a very thin slick, with most of the volatile components typically evaporating in less than a day. Approximately 41% by mass of this oil is predicted to evaporate over the first couple of days depending on the prevailing wind conditions, with further evaporation slowing over time. The heavier (low volatility) components of the oil tend to entrain into the upper water column due to wind-generated waves, but can subsequently resurface depending on conditions (RPS, 2019, 2021).

RPS conducted weathering simulations to illustrate the potential behaviour of MDO when exposed at the water’s surface under constant (5 knots) and variable wind conditions (Figure 6-7 and Figure 6-8). Variable wind conditions generate greater entrainment of the hydrocarbon in the water column. Approximately 24 hours after the spill, around 45% of the oil mass is forecast to have entrained and a further 36% is forecast to have evaporated, leaving only a small proportion of the oil floating on the water surface (<1%). The residual compounds will tend to remain entrained beneath the surface under conditions that generate wind waves (approximately >6 m/s).

Variable wind does result in a higher percentage of biological and photochemical degradation, with an approximate rate of 1.8% per day. Whereas the constant wind scenario shows ~50% of the oil evaporates within 36 hours with negligible entrainment, but with a rate of only ~0.2% degradation per day.

Table 6-30: Characteristics of the marine diesel

Hydrocarbon type	Initial density (g/cm ³) at 25 °C	Viscosity (cP @ 25 °C)	Component	Volatiles (%)	Semi volatiles (%)	Low volatility (%)	Residual (%)
			BP (°C)	<180	180–265	265-380	>380
				Non-Persistent			Persistent
Marine diesel	0.829	4.0	% of total	6	34.6	54.4	5

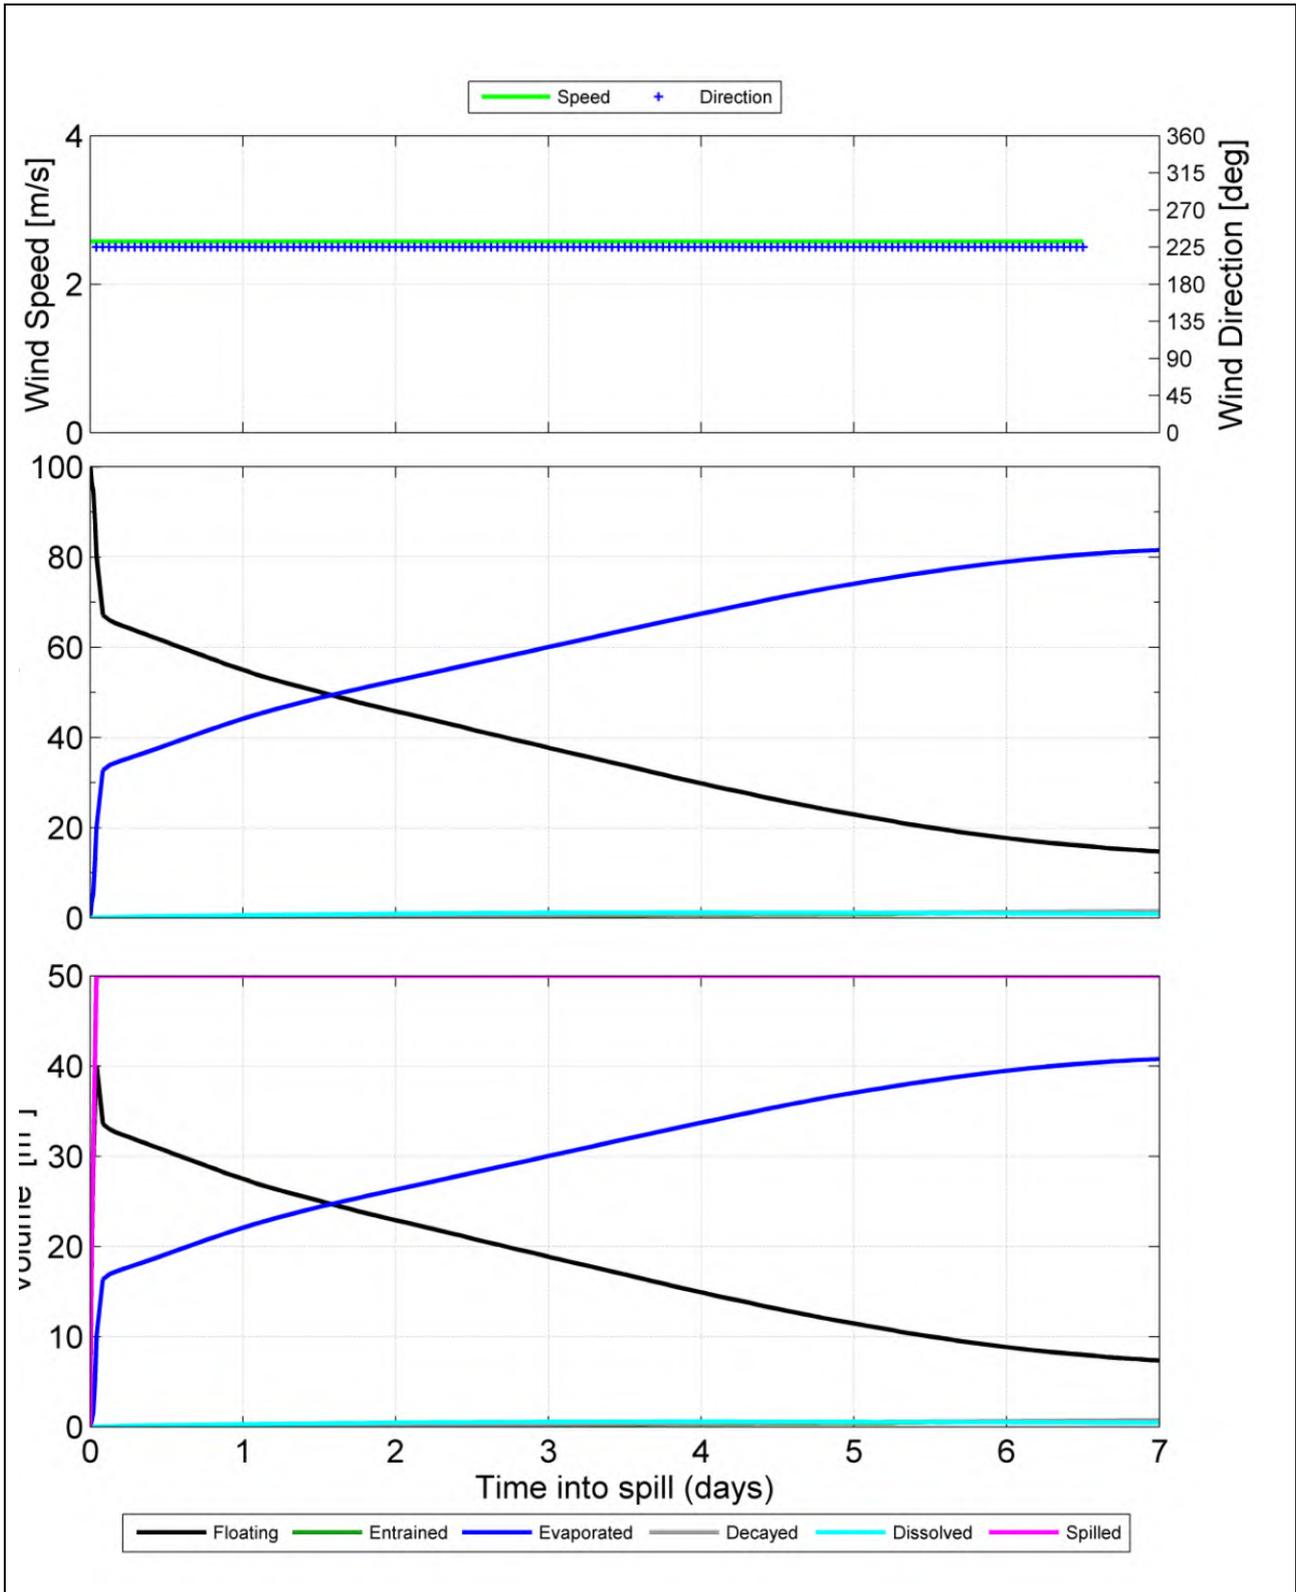

Figure 6-7: Mass balance plot representing, as proportion (middle panel) and volume (bottom panel), the weathering of marine diesel spilled onto the water surface as a one-off release (50 m³ over 1 hour) and subject to a constant 5 kn (2.6 m/s) wind at 27 °C water temperature and 25 °C air temperature.

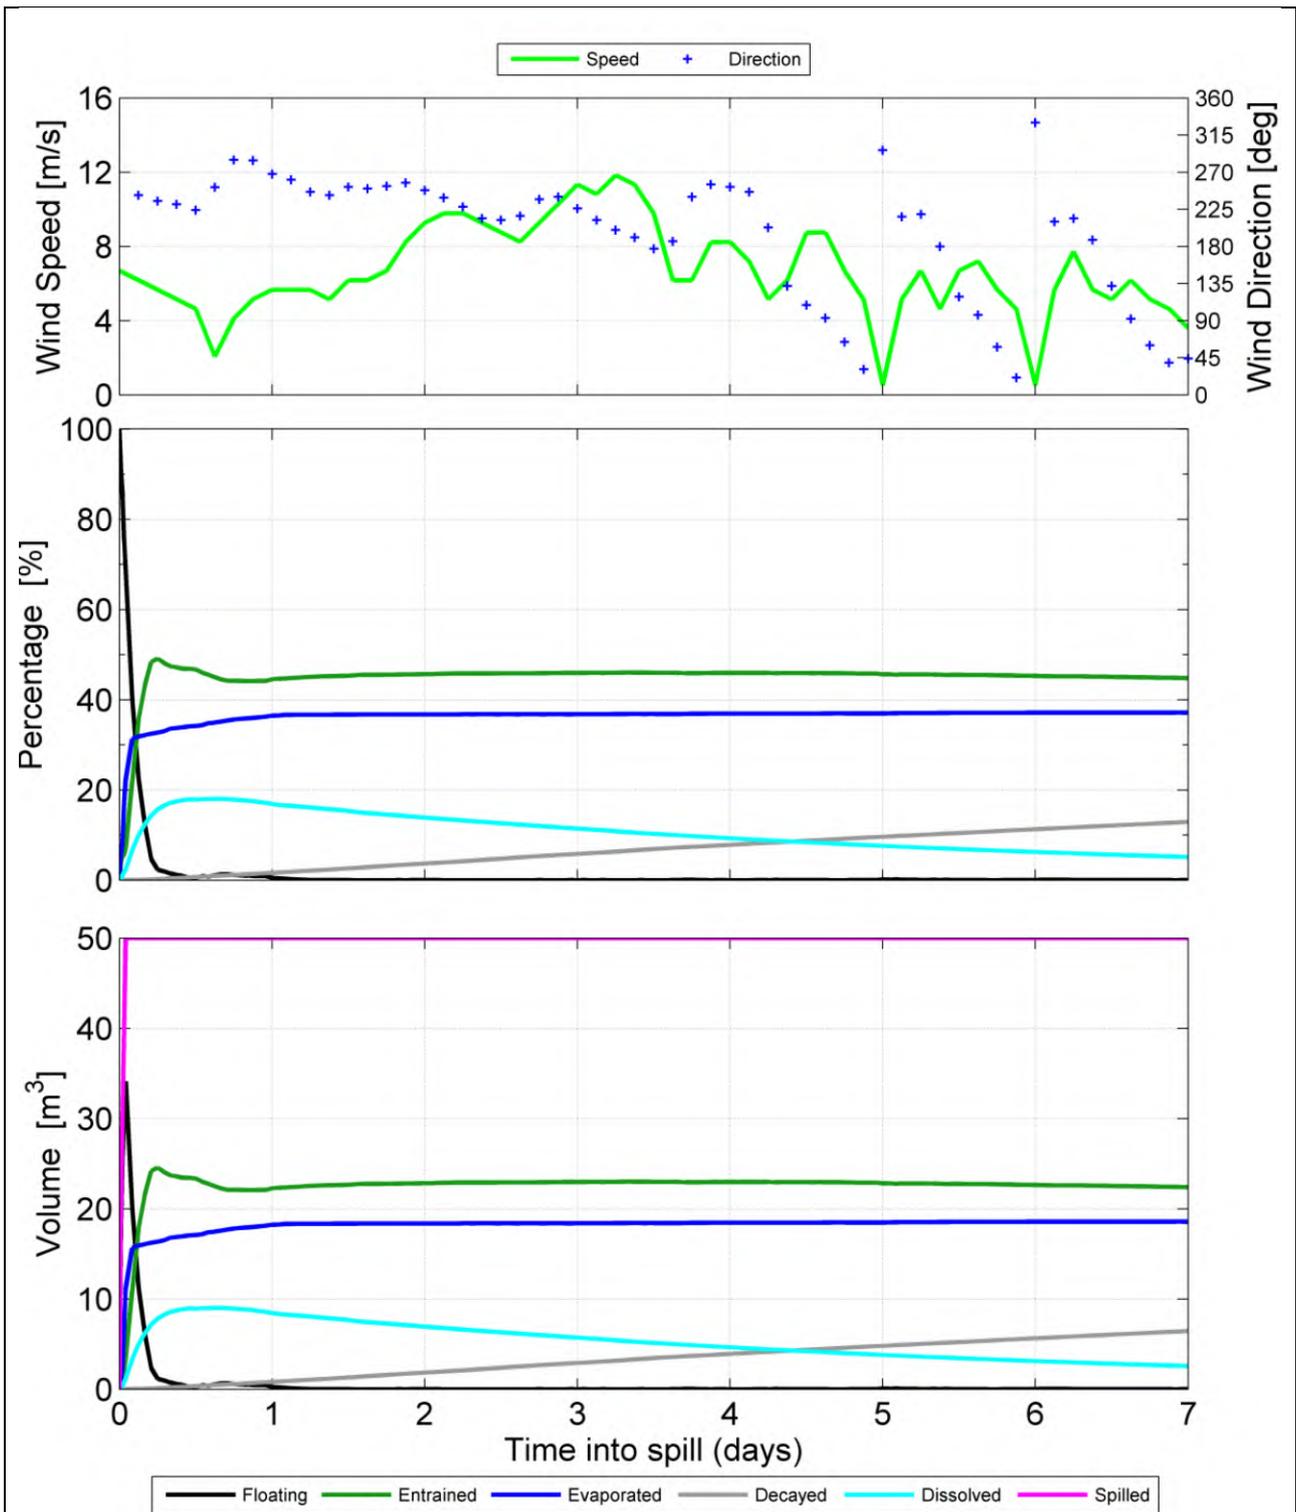

Figure 6-8: Mass balance plot representing, as proportion (middle panel) and volume (bottom panel), the weathering of marine diesel spilled onto the water surface as a one-off release (50 m³ over 1 hour) and subject to variable wind at 27 °C water temperature and 25 °C air temperature.

Detailed Impact Assessment

Assessment of Potential Impacts

Environment that May Be Affected

The Hydrocarbon EMBA for the Petroleum Activities Program is based on stochastic modelling which compiles data from 100-200 hypothetical worst-case spills under a variety of weather and metocean conditions (as described in Section 6.8.1) (RP, 2019, 2021). The EMBA therefore covers a larger area than the area that would be affected during any one single spill event, and therefore represents the total extent of all the locations where hydrocarbon thresholds could be exceeded from all modelling runs. The trajectory of a single spill would have a considerably smaller footprint.

As described in Section 6.8.1, three hydrocarbon spill locations were modelled in order to represent the range of locations of where vessel collision could occur within the Operational Area (refer to Table 6-25). The EMBA has been defined using a combination of all three locations, as shown in Figure 4-1, the largest extent of the Hydrocarbon EMBA is based on the entrained threshold from the modelled locations and therefore includes the results from 600 runs. In the event of a spill the EMBA would be much smaller and is intermittent e.g. plume travels away from the release location based on prevailing currents and winds directions. Therefore one area is not exposed to hydrocarbons above thresholds for the entire simulation.

As the weathering of different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is discussed for each fate.

Surface Hydrocarbons

Modelling of surface hydrocarbons from Location 1 (outside Mermaid Sound) indicates that concentrations equal to or greater than the 10 g/m² threshold could potentially be found up to 29 km from the spill site. Dampier Archipelago (2% probability), Dampier Marine Park (2% probability) and WA Coastline (3% probability) are predicted to receive floating oil at concentrations equal to or greater than 10 g/m². Deterministic modelling was undertaken, to assist with response planning, which demonstrates that hydrocarbon exposure at discrete locations will be intermittent. For example a worst case modelling run demonstrated that the Dampier Archipelago would be exposed to surface hydrocarbons for less than two days (Day 1-2) and then again from Day 11-13 (42 hours). After which it was not predicted to be exposed to any surface hydrocarbons.

Modelling of surface hydrocarbons from Location 2 (Montebello AMP) indicates that concentrations equal to or greater than the 10 g/m² threshold could potentially be found up to 39 km from the spill site. Given that this spill location lies within the Montebello AMP receptor area, floating oil at concentrations equal to or greater than 100 g/m² are forecast with a probability of 100%. Probabilities of floating oil contact at the 10 g/m² threshold are forecast to be less than 1% for all other shoreline receptors.

Modelling of surface hydrocarbons from Location 3 (FPU/end of trunkline) indicates that concentrations equal to or greater than the 10 g/m² threshold could potentially be found up to 113 km from the spill site. No shoreline receptors are predicted to be contacted by surface hydrocarbons concentrations. Floating oil at the 10 g/m² threshold is predicted to arrive at the surface waters of the Gascoyne Marine Park receptor with a probability of 1% after 64 hours.

Accumulated Hydrocarbons

Potential for accumulation of oil on shorelines is predicted to be low from a spill at Location 1 (outside Mermaid Sound), with a maximum accumulated volume of 3 m³ and a maximum local accumulated concentration on shorelines of 156 g/m² forecast at Dampier Archipelago and a probability of 1% above the ecological threshold concentration (100 g/m²).

Accumulated hydrocarbons above threshold concentrations (≥ 100 g/m²) were not predicted by the modelling to occur from a spill at Location 2 (Montebello AMP) or Location 3 (FPU/end of trunkline).

Entrained Hydrocarbons

Entrained oil at concentrations equal to or greater than the 100 ppb threshold is predicted to be found up to around 414 km from a spill at Location 1 (outside Mermaid Sound). The Dampier Marine Park (54%), Dampier Archipelago (51%), Montebello Islands (8%), Muiron Islands MMA-WHA (2%), Pilbara – Middle (Islands and Shoreline, 5%), Pilbara Islands – Northern (Islands and Shoreline, 7%), Montebello Marine Park (12%), Montebello State Marine Park (8%), Muiron Islands (2%), Eighty Mile Beach (1%), Gascoyne Marine Park (2%) and WA Coastline (51%) receptors are predicted to receive entrained oil concentrations at the 100 ppb threshold with probabilities in parenthesis, respectively. The maximum entrained oil concentration is forecast as 10,911 ppb within the Dampier Archipelago.

Entrained oil at concentrations equal to or greater than the 100 ppb threshold is predicted to be found up to around 630 km from a spill at Location 2 (Montebello AMP). The following receptors are predicted to receive entrained oil concentrations at the 100 ppb threshold with probabilities in parenthesis: Montebello Marine Park (78%), Muiron Islands Marine Management Area – World Heritage Area (MMA-WHA, 13%), Argo-Rowley Terrace MP (1%), Barrow Island (5%), Montebello Islands (8%), Ningaloo Coast (Middle, Middle WHA, North, North WHA, max. 12%), Ningaloo RUZ (12%), Pilbara Islands – Southern Island Group (5%), Rankin Bank (1%), Shark Bay (Open Coast and WHA, 1% and 1%, respectively), Bernier & Dorre Islands (1%), Lowendal Islands (1%), Montebello State Marine Park (13%), Muiron Islands (11%), Gascoyne Marine Park (11%) and WA Coastline (10%). The maximum entrained oil concentration is forecast as 156,954 ppb within the Montebello Marine Park.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Entrained oil at concentrations equal to or greater than the 100 ppb threshold is predicted to be found up to around 918 km from a spill at Location 3 (FPU/end of trunkline). The Gascoyne Marine Park, Carnarvon Canyon Marine Park and Abrolhos Islands Marine Park receptors are predicted to receive entrained oil concentrations at the 100 ppb threshold with a probability of 10%, 1% and 1%, respectively. The maximum entrained oil concentration is forecast as 7236 ppb within the Gascoyne Marine Park.

Similar to the fate of surface hydrocarbons, deterministic modelling has indicated entrained hydrocarbons above threshold, 100 ppb, will be limited in duration at discrete locations e.g. at the release location entrained hydrocarbons is only expected to remain above 100 ppb, for a maximum of 18 hours.

Dissolved Hydrocarbons

Dissolved aromatic hydrocarbons at concentrations equal to or greater than the 50 ppb threshold are predicted to be found up to around 90 km from a spill at Location 1 (outside Mermaid Sound). Dissolved aromatic hydrocarbons at concentrations equal to or greater than the 50 ppb threshold are predicted at Dampier Archipelago (probability 15%), Dampier Marine Park (probability 24%) and the WA Coastline (probability 15%), with a maximum dissolved aromatic hydrocarbon concentration forecast of 635 ppb.

Dissolved aromatic hydrocarbons at concentrations equal to or greater than the 50 ppb threshold are predicted to be found up to around 216 km from a spill at Location 2 (Montebello AMP). Barrow Island (probability 1%), Montebello Islands (probability 1%), Rankin Bank (probability 1%), Montebello Marine Park (probability 49%), Montebello State Marine Park (probability 1%) and the WA Coastline (probability 1%) are receptors predicted to receive dissolved aromatic hydrocarbon concentrations at the 50 ppb threshold. The maximum dissolved aromatic hydrocarbon concentration is forecast as 1990 ppb within the Montebello Marine Park.

Dissolved aromatic hydrocarbons at concentrations equal to or greater than the 50 ppb threshold are predicted to be found up to around 244 km from a spill at Location 3 (FPU/end of trunkline). The Gascoyne Marine Park is the only receptor predicted to receive dissolved aromatic hydrocarbon concentrations at the 50 ppb threshold with a probability of 3%. The maximum dissolved aromatic hydrocarbon concentration is forecast as 462 ppb within the Gascoyne Marine Park.

Water Quality

An unplanned release of marine diesel, would result in a change in water quality, affecting the ambient water quality within the Hydrocarbon EMBA as follows:

- The highly-mixed, open water location and characteristics of marine diesel will result in rapid evaporation and dispersion.
- Water quality would be reduced and is predicted to be at or above biological effect concentrations for the surrounding marine waters over the Montebello Marine Park. The submerged Tryal Rocks (30-40 m depth) within the Montebello Marine Park has the potential to be exposed to entrained hydrocarbons at or greater than 100 ppb. The waters surrounding this submerged habitat would show a reduction in quality due to hydrocarbon contamination above background and/or national/international quality standards.
- Exposure to significant habitats will be at low levels such that no significant habitats or ecosystem function or integrity will be impacted (as discussed in the receptor sections).
- Based on the deterministic modelling, in the event of a spill, the potential area exposed to hydrocarbons is much smaller and only for a short period of time given the nature of MDO to evaporate and spread quickly. Therefore, the magnitude of a potential impact to water quality associated with a release of hydrocarbons is slight.

Plankton

Injury/mortality to planktonic species may occur due to a change in water quality following an unplanned hydrocarbon release as follows:

- Plankton in contact with the spill source at the time of release may be impacted, and there is potential for localised mortality.
- Given hydrocarbon characteristics, expected rapid weathering and then degradation of the entrained component, and the relatively quick recovery times of plankton, unplanned marine diesel releases are not expected to have a substantial adverse effect on plankton life cycle and spatial distribution and potential impacts would be limited to slight.

Fish, Sharks and Rays

Injury/mortality to fish species may occur due to a change in water quality following an unplanned hydrocarbon release as follows:

- While fish and sharks do not generally break the sea surface, individuals may feed at the surface for a short period. Marine diesel is expected to quickly disperse and evaporate, limiting the exposure.
- Fishes are more susceptible to the effects of spilled oil (particularly entrained and dissolved) in their early life stages, particularly during egg and planktonic larval stages, which can become entrained in spilled oil. Effects will be greatest in the upper 10 m of the water column where hydrocarbon concentrations are higher.
- Impacts to sharks and rays may occur through direct contact with hydrocarbons and contaminate the tissues and internal organs, either through direct contact or via the food chain (consumption of prey). As gill breathing organisms, sharks and rays may be vulnerable to toxic effects of dissolved hydrocarbons (entering the body via the gills) and entrained hydrocarbons (coating of the gills inhibiting gas exchange).
- More subtle, chronic effects on the life history of fishes may occur due to early life stage exposure. Effects may include disruption to complex behaviour such as predator avoidance, reproductive and social behaviour (Hjermann et al., 2007).
- Adult fishes exposed to low hydrocarbon concentrations are likely to metabolise the hydrocarbons and excrete the derivatives, with studies showing that fishes can metabolise petroleum hydrocarbons and that accumulated hydrocarbons are released from tissues when the fish is returned to hydrocarbon-free sea water.
- A BIA for whale shark foraging overlaps the Operational Area between KP 72 and KP 199, as well as the EMBA. Whale sharks may transit offshore open waters when migrating to and from Ningaloo Reef, where they aggregate for feeding from March to July. Whale sharks are versatile feeders, filtering large amounts of water over their gills, catching planktonic and nektonic organisms (Jarman and Wilson, 2004). It is therefore possible that surface and/or entrained hydrocarbon and/or dissolved aromatic hydrocarbon could come in contact with, or be ingested by whale sharks migrating or aggregating in the area at the time of release

The magnitude of a potential impact to fish associated with a release of hydrocarbons is slight. Although potential impacts could include mortality or sub-lethal injury/illness of pelagic fish, this would be expected to comprise a small proportion of the resident and transitory population. Given hydrocarbon characteristics, expected rapid weathering to below impact thresholds and degradation of entrained fractions, and the mobile transient nature of fish, unplanned release is not expected to have a substantial adverse effect on the population, or spatial distribution of fish/sharks/rays.

Marine Mammals

A change in marine fauna behaviour or injury/mortality to marine mammals may occur due to a change in water quality after an unplanned hydrocarbon release as follows:

- A range of marine mammal species were identified as potentially occurring within the Operational Area and EMBA (Section 4.6.3).
- BIAs of marine mammals listed as MNES overlap the Trunkline Project Area, including humpback whales (migration and resting BIAs) and pygmy blue whales (northbound and southbound migrations). BIAs of MNES listed marine mammals also overlap the EMBA (Section 4.6.3), including humpback whales (migration and resting BIAs), dugongs (foraging and breeding, nursing, calving BIAs) and pygmy blue whales (northbound and southbound migrations, distribution and foraging BIAs).
- Humpback and/or pygmy blue whale populations may be impacted if the hydrocarbon release occurs during the seasonal migration periods. Such disruption could include behavioural impacts (e.g. avoidance of impacted areas), sub-lethal biological effects (e.g. skin irritation, irritation from ingestion or inhalation, reproductive failure) and, in rare circumstances, death.
- Dugongs may be indirectly impacted via habitat loss due to reduction in seagrass due to from contact with entrained hydrocarbons. Direct impacts to dugongs could occur through foraging or ingesting seagrass coated with hydrocarbon.
- Marine mammals may come in direct contact with hydrocarbons should they surface within the slick. Impacts to the species can include irritation of eyes/mouth and potential illness from hydrocarbon ingestion.
- Entrained and dissolved hydrocarbons may lead to sub-lethal physical and toxic effects, such as irritation and illness. The likelihood of toxic effects occurring is increased closer to the release location.
- Conservation advice for some marine mammal species identify noise interference and vessel disturbance as key threats. While hydrocarbon spills are not explicitly identified as a threat, conservation advice for the sei whale does include the management of physical disturbance and development activities. No explicit management actions are identified relevant to hydrocarbon spills.

The magnitude of a potential impact to marine mammals associated with a release of hydrocarbons is slight. Although potential impacts could include mortality or sub-lethal injury/illness of marine mammals, this is expected to comprise a small proportion of the resident and transitory population. Given hydrocarbon characteristics, expected rapid weathering of surface oil to below impact thresholds, and the mobile transient nature of marine mammals and potential avoidance behaviour, unplanned releases of marine diesel are not expected to have a substantial adverse effect on the population, or spatial distribution of marine mammals; or substantially modify, destroy or isolate an area of important habitat for migratory species.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Marine Reptiles

A change in marine fauna behaviour or injury/mortality to marine reptiles may occur due to direct contact or a change in water quality leading to indirect impacts following an unplanned hydrocarbon release as follows:

- Flatback, green, loggerhead and hawksbill turtle internesting BIAs overlap the Trunkline Project Area and EMBA (Section 4.6.2). Flatback, green and hawksbill turtles also have internesting habitat critical overlapping with the Trunkline Project Area, particularly, for the Dampier Archipelago.
- Hydrocarbons in surface waters may impact turtles when they surface to breathe and inhale toxic vapours.
- Contact with entrained hydrocarbons can result in hydrocarbon adherence to body surfaces, irritating mucous membranes in the nose, throat and eyes, leading to inflammation and infection (Gagnon and Rawson, 2010). Oiling can also irritate and injure skin, which is most evident on pliable areas such as the neck and flippers (Lutcavage et al., 1995).
- Turtles within shallow coastal waters may be impacted as they feed in shallow water coral and macroalgae habitats, and therefore, may ingest hydrocarbons.
- Accumulated hydrocarbons on shorelines could impact marine fauna that utilise beaches including marine turtles, dependent upon the timing of a release. However volumes of accumulated hydrocarbons are low.

The magnitude of potential impacts to marine reptiles from unplanned hydrocarbon releases is assessed as no lasting effects (from change in fauna behaviour) and slight (from injury/mortality to fauna). Although potential impacts could include mortality or sub-lethal injury/illness of marine reptiles, this is expected to comprise a small proportion of the resident and transitory population. Given hydrocarbon characteristics, expected rapid weathering to below impact thresholds, and the mobile transient nature of individuals, unplanned hydrocarbon releases are not expected to substantially modify, destroy or isolate an area of important habitat for migratory species.

Seabirds and Migratory Shorebirds

Change in marine fauna behaviour or injury/mortality to seabirds and migratory shorebirds may occur due to a change in water or sediment quality following an unplanned hydrocarbon release as follows:

- Breeding and foraging BIAs for EPBC listed seabird species that overlap the EMBA may be impacted by a hydrocarbon release (Section 4.6.4).
- Seabirds and migratory shorebirds are particularly vulnerable to contact with surface hydrocarbons, which may mat feathers, leading to hypothermia from loss of insulation and ingestion of hydrocarbons when preening to remove hydrocarbons. Both impacts may result in mortality (Hassan and Javed, 2011).
- Lethal or sub-lethal physical and toxic effects may occur to seabirds, including irritation of eyes/mouth and potential illness.
- It is commonly thought that marine diesel does not cause problems for wildlife due to the lack of visible oiling, however may be toxic (WAOWRP, 2014). Pathways of biological exposure that can result in impact may occur through ingesting contaminated fish (nearshore waters) or invertebrates (intertidal foraging grounds such as beaches, mudflats and reefs).
- Shorebirds may encounter accumulating hydrocarbons on shorelines at feeding, roosting and breeding sites. The risk of impact is greater should an unplanned hydrocarbon release occur within the chick-rearing period, where adults forage closer to breeding colonies.

The magnitude of a potential impact to seabirds and migratory shorebirds associated with a release of hydrocarbons is having no lasting effects (from change in fauna behaviour) and slight (from injury/mortality to fauna). Although potential impacts could include mortality or sub-lethal injury/illness of birds, this is expected to comprise a small proportion of the resident and transitory population. Given hydrocarbon characteristics, expected rapid weathering to below impact thresholds, and the mobile transient nature of individuals, unplanned hydrocarbon releases are not expected to substantially modify, destroy or isolate an area of important habitat for migratory species.

Coral

A change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release as follows:

- Significant areas of coral are known to occur fringing the Dampier Archipelago, (such the outer islands of Legendre etc), Montebello Islands, Rankin Bank, Barrow Island, Lowendal Islands, the Ningaloo Coast and Muiron Islands, Shark Bay outer islands of Bernier & Dorre Islands, all within the EMBA.
- Exposure to entrained hydrocarbons (≥ 100 ppb) has the potential to result in lethal or sub-lethal toxic effects to corals and other sensitive sessile benthos within the upper water column, including upper reef slopes (subtidal corals) and reef flat (intertidal corals).
- Sub-lethal effects to corals may include polyp retraction, changes in feeding, bleaching (loss of zooxanthellae), increased mucous production resulting in reduced growth rates and impaired reproduction (Negri and Heyward, 2000).
- Should a hydrocarbon release occur at the time of coral spawning (at potentially affected coral locations), there is the potential for a significant reduction in successful fertilisation and coral larval survival, due to the sensitivity of coral in early life stages to hydrocarbons (Negri and Heyward, 2000).

Due to the short duration of the spill (i.e. instantaneous release, and short exposure time as demonstrated by deterministic modelling), the confined spatial extent and the tendency of MDO to remain on the sea surface, significant exposure over a large scale is limited. Unplanned hydrocarbon releases from Scarborough are not expected modify, destroy, fragment, isolate or disturb an important or substantial area of habitat, such that an adverse impact on marine ecosystem functioning or integrity results. Based on the assessment, the magnitude of a potential impact to coral associated with a release of hydrocarbons is moderate (i.e. medium-term impacts to ecosystem/habitat service on a far-field scale).

Seagrass and Macroalgae

A change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release as follows:

- Seagrass and macroalgae communities are found in shallow waters surrounding islands of the Dampier Archipelago, Barrow Island, Lowendal Islands, Muiron Islands, Pilbara Islands, Bernier and Dorre Islands, Montebello Islands as well as Eighty Mile Beach AMP, Ningaloo Coast North/North WHA and South/South WHA and RUZ and Shark Bay Open Ocean Coast. Modelling predicts that both Dampier and Montebello marine parks are predicted to be intersected with entrained hydrocarbons over the exposure thresholds (RPS, 2019, 2021). In particular, the Montebello Marine Park has a 78% probability, with high concentrations of entrained hydrocarbons. This is to be expected, as the release location modelled is within the marine park boundaries.
- Exposure to entrained hydrocarbons may result in mortality of seagrass and macroalgae, depending on actual entrained aromatic hydrocarbon concentrations received and duration of exposure. Physical contact with entrained hydrocarbon droplets could cause sub lethal stress, causing reduced growth rates and reduced tolerance to other stress factors.
- Seagrass and macroalgal beds in the intertidal and subtidal zone may be susceptible to impacts from entrained hydrocarbons. Toxicity effects can also occur due to absorption of soluble fractions of hydrocarbons into tissues.

While areas where seagrass and macroalgae can occur may be exposed, given the hydrocarbon characteristics, expected rapid weathering to below impact thresholds, any exposure would be to a limited area and short-term, and as such an unplanned hydrocarbon release is not expected to result in a level of exposure to seagrass and macroalgae that would cause an adverse impact on marine ecosystem functioning or integrity results. Based on the assessment, the magnitude of a potential impact to seagrass and macroalgae associated with a release of hydrocarbons is having no lasting effect.

Mangroves

A change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release as follows:

- Modelling predicts that there is 1% probability of shorelines being contacted over the exposure threshold for any release location at Dampier Archipelago, Barrow Island and WA coastline, with the maximum local volume predicted to accumulate of 3 m³. Both shorelines include some areas of mangroves (RPS, 2019, 2021).
- Mangroves are considered to have a high sensitivity to hydrocarbon exposure.
- Mangroves can be impacted by heavy or viscous oil, or emulsification, that covers the trees breathing pores thereby asphyxiating the subsurface roots, which depend on the pores for oxygen (IPIECA, 1993).
- Hydrocarbons deposited on the aerial roots can block the pores used to breathe, or interfere with the trees salt balance, resulting in sub-lethal and potentially lethal effects.
- Acute impacts to mangroves can be observed within weeks of exposure, whereas chronic impacts may take months to years to detect.

Given hydrocarbon characteristics, rapid weathering, the low predicted volume ashore (3 m³), an unplanned release is not expected to have a substantial adverse impact on marine ecosystem functioning or integrity. Based on the assessment, the magnitude of a potential impact to mangroves associated with a release of hydrocarbons is having no lasting effect.

Shoreline Habitats

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

A change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release as follows:

- Hydrocarbons that contact sandy shores may be incorporated into fine sediments through mixing in the surface layers from wave energy, penetration down worm burrows and root pores.
- Hydrocarbon in the intertidal zone can adhere to sand particles however high tide may remove some or most of the hydrocarbon from the sediments. Accumulated hydrocarbons $\geq 100 \text{ g/m}^2$ could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat (French-McCay, 2009).
- Coastal habitats that occur on the coastline within the EMBA include saltmarshes and mangroves around the Dampier Archipelago.

Given hydrocarbon characteristics, rapid weathering and the low predicted volume ashore (3 m^3), an unplanned release is not expected to have a substantial adverse impact on marine ecosystem functioning or integrity at exposed shorelines. Based on the assessment, the magnitude of a potential impact to shoreline habitats associated with a release of hydrocarbons is assessed as having no lasting effect.

Saltmarshes

A change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release as follows:

- Areas of saltmarshes are known to occur within the Dampier Archipelago and WA Coastline, with both areas potentially receiving shoreline accumulation above 100 g/m^2 . Modelling predicts that there is 1% probability of these shorelines being contacted over the exposure threshold, with a maximum local volume predicted to accumulate of 3 m^3 .
- Hydrocarbons can enter saltmarsh systems during the tidal cycles, if the estuary/inlet is open to the ocean. Similar to mangroves, this can lead to a patchy distribution of the oil and its effects, due to different areas within the inlets at different tidal heights.
- Hydrocarbons can adhere to the marshes, coating the stems from tidal height to sediment surface.

Given hydrocarbon characteristics, rapid weathering and the low predicted volume ashore (3 m^3), an unplanned release is not expected to have a substantial adverse impact on marine ecosystem functioning or integrity at exposed shorelines. Based on the assessment, the magnitude of a potential impact to saltmarsh associated with a release of hydrocarbons is assessed as having no lasting effect.

Key Ecological Features

Change in habitat may occur due to a change in water or sediment quality that could impact KEFs. The location of the KEFS within the EMBA are presented in Section 4.7. As marine diesel typically remains in the top 10 m of the water column and rapidly weathers, in-water hydrocarbons are only likely to intersect with seafloor and demersal values in shallower waters. The water depths and potential impacts to the six relevant KEFs are summarised as follows:

- Exmouth Plateau KEF (intersects the Operational Area and EMBA): Values and sensitivities are related to seafloor features. Receptors on the seafloor are not expected to be impacted by a surface release of hydrocarbons, given the water depths ($\sim 930 \text{ m}$). However, these seafloor features may promote enhanced upwelling; potential impacts to plankton and fishes are discussed above.
- Ancient Coastline KEF (intersects the Operational Area and EMBA): The KEF includes areas of hard substrate and higher diversity and species richness relative to surrounding areas of predominantly soft sediment. Given the minimum water depth in this KEF is 115 m, seafloor receptors are unlikely to be impacted by a surface hydrocarbon release. However, the submerged coastline may facilitate mixing of the water column enhancing productivity. Combined with greater diversity of sessile benthic organisms, this may increase abundance of pelagic species such as fishes and cetaceans, impacts to which are discussed above.
- Continental Slope Demersal Fish Communities KEF (intersects the Operational Area and EMBA): The KEF represents high levels of endemism of demersal fish species. Considering the minimum water depths of this KEF are 220–500 m and 750–1,000 m, impacts to demersal fishes are unlikely to occur. However, the values of the

KEF may support higher order consumers, such as pelagic fish and shark species, impacts to which are discussed above.

- Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula KEF (intersects the EMBA): Aggregations of whale sharks, manta rays, humpback whales, sea snakes, sharks, predatory fishes and seabirds are known to occur in the KEF due to its enhanced productivity, impacts to which are discussed above.
- Commonwealth Waters Adjacent to Ningaloo KEF (intersects the EMBA): The spatial boundary of this KEF, as defined in the National Conservation Values Atlas, is the waters contained in the existing Ningaloo AMP and is described below.
- Glomar Shoal KEF (intersects the EMBA on the Rowley shelf at depths of 33 m to 77 m): The values of the KEF are high productivity and aggregations of marine life, impacts to which are discussed above.
- Western demersal slope and associated fish communities KEF (intersects the EMBA): The KEF supports high biodiversity of demersal fish communities, impacts to which are discussed above.
- Wallaby Saddle (intersects the EMBA): The KEF is defined for its high productivity and aggregations of marine life. These values apply to both the benthic and pelagic habitats within the feature, impacts to which are discussed above.

AMPs

Quantitative stochastic spill modelling predicts contact above the relevant exposure threshold at the AMPs:

- Montebello Marine Park
- Dampier Marine Park
- Gascoyne Marine Park
- Ningaloo Marine Park
- Argo-Rowley Terrace Marine Park
- Carnarvon Canyon Marine Park
- Abrolhos Marine Park
- Eighty Mile Beach Marine Park
- Shark Bay Marine Park

The hydrocarbon spill is unlikely to result in significant impacts to AMPs based on the nature of the spilled hydrocarbons. Natural values for the AMPs include:

- Marine turtle BIAs for Dampier, Gascoyne, Ningaloo, Montebello and Eighty Mile Beach Marine Parks
- Humpback whale migration BIAs for Montebello, Dampier and Gascoyne Marine Parks, Ningaloo Marine Park
- Pygmy blue whale possible foraging area and migration BIA for Gascoyne, Ningaloo Marine Parks and Montebello Marine Park
- Dugong breeding, nursing, calving habitat BIA for Exmouth Gulf and Ningaloo Marine Park
- Diverse fish communities for the Dampier, Gascoyne, Ningaloo or Montebello Marine Parks, as well as Argo-Rowley Terrace Marine Park, Carnarvon Canyon Marine Park, Abrolhos Islands Marine Park, Eighty Mile Beach Marine Park
- Diverse fish communities specifically within the Continental Slope Demersal Fish Communities KEF for Gascoyne and Ningaloo Marine Parks
- Whale shark foraging habitat BIAs for Montebello and Ningaloo Marine Parks
- Seabird breeding habitat BIAs for Montebello, Dampier, Gascoyne and Ningaloo Marine Parks, as well as Argo-Rowley Terrace Marine Park, Carnarvon Canyon Marine Park, Abrolhos Islands Marine Park, Eighty Mile Beach Marine Park
- Seabird foraging habitat BIAs for Dampier, Gascoyne, Ningaloo, Montebello, Argo-Rowley Terrace, Carnarvon Canyon, Abrolhos Islands and Eighty Mile Beach Marine Parks.

While this results in exposure to hydrocarbons for some of the natural values of the marine parks, the impacts will be temporary as the MDO evaporates and degrades and moves with ocean currents. The evaluation of impacts to specific receptors are detailed in the individual receptor assessments above and below. Based on the assessment, the magnitude of a potential impact to AMPs associated with a release of hydrocarbons is slight.

State Waters Protected Places

Quantitative spill modelling predicts contact above the relevant exposure threshold at the following protected places (RPS, 2019, 2021):

- Barrow Island
- Muiron Islands MMA-WHA
- Montebello State Marine Park

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

- Thevenard Island Nature Reserve
- Ningaloo State Marine Park

The conservation values of these areas have been previously described but include foraging and migratory pathways for some species of seabirds, whale shark, turtles and whales.

A hydrocarbon spill is unlikely to result in significant impacts to State protected places based on the nature of the spilled hydrocarbons. Based on the evaluation, the magnitude of potential impact to protected places from unplanned hydrocarbon releases is assessed as slight.

Commonwealth and State-managed Fisheries

Change in marine fauna behaviour or injury or mortality to marine fauna, in particular to commercially targeted species, or their prey species (e.g. plankton) can impact fisheries as follows:

- Fish exposure to hydrocarbon can result in 'tainting' of their tissues. Even very low levels of hydrocarbons can impart a taint or 'off' flavour or smell in seafood.
- Tainting is reversible through the process of depuration which removes hydrocarbons from tissues by metabolic processes, although it depends on the magnitude of the contamination.
- Fishes have a high capacity to metabolise these hydrocarbons while crustaceans (such as prawns) have a reduced ability (Yender et al., 2002).
- Actual or potential contamination of seafood can affect commercial and recreational fishing and can impact seafood markets long after any actual risk to seafood from a spill has subsided (Yender et al., 2002).
- The only Commonwealth-managed fishery expected to be active within the vicinity of the Operational Area is the NWSTF (Section 4.9.2). However, given the fishing method (i.e. trawl) and operations in deep water areas (>200 m) of this fishery, no significant impact from a marine diesel spill is predicted.
- Presence of hydrocarbons in areas used by State-managed fisheries (Section 4.9.2) may occur, however given the type of hydrocarbon and duration of exposure, no significant impact from a marine diesel spill is expected to occur.
- A major hydrocarbon spill could result in the establishment of an exclusion zone around the spill affected area. Within this exclusion zone there would be a temporary prohibition on fishing activities for a designated period of time, and subsequent potential for economic impacts to affected commercial fishing operators.

Given hydrocarbon characteristics, expected rapid weathering to below impact thresholds, and low fishing effort, an unplanned release is not expected to have a substantial adverse effect on the sustainability of commercial fishing; or to interfere with other marine users. Therefore the magnitude of a potential impact to commonwealth and state managed fisheries associated with a release of hydrocarbons is no lasting effect

Tourism and Recreation and Cultural Values

Change in marine fauna behaviour, injury or mortality to marine fauna, change in aesthetic value and change to the functions, interests or activities of other users would impact tourism and recreation following an unplanned hydrocarbon release as follows:

- Charter fishing, diving, snorkelling, marine fauna (whale, marine turtle and dolphin) watching and cruises are the main commercial tourism activities in and adjacent to the NWMR. With the exception of offshore charter fishing, most marine tourism activities occur in State waters (DEWHA, 2008).
- Any impacts to receptors that provide nature-based tourism features (e.g. whales) may cause a subsequent negative impact to recreation and tourism activities. There is also potential for impacts to the wider service industry (hotels, restaurants and their supply chain) and local communities in terms of economic loss as a result of spill impacts to tourism.

Given hydrocarbon characteristics, expected rapid weathering to below impact thresholds, small volumes predicted ashore an unplanned release is not expected to interfere with other marine users to a greater extent than necessary. Based on the assessment, the magnitude of a potential impact to tourism and recreation associated with a release of hydrocarbons is slight.

Shipping

A change to the functions, interests or activities of other users may impact shipping following an unplanned hydrocarbon release as follows:

- In the event of a large spill, an exclusion zone may be established around the spill affected area. This could result in exclusion of other users such as shipping vessels or vessels used by the mining and petroleum industries. Any exclusion zone established would be limited to the immediate vicinity of the release point, and due to the rapid weathering of marine diesel would only be in place for days after release, therefore physical displacement to vessels is unlikely to be a significant impact.
- The environmental performance outcome for shipping is to not interfere with other marine users, including shipping, to a greater extent than is necessary for the exercise of right conferred by the titles granted.

Given hydrocarbon characteristics, expected rapid weathering to below impact thresholds, short duration of displacement, and the offshore location of the Operational Area, unplanned releases of MDO are not expected to interfere with shipping to a greater extent than necessary. Based on the assessment, the magnitude of a potential impact to shipping associated with an unplanned release of hydrocarbons is slight. Receptor sensitivity of shipping is medium (medium value user), and therefore the consequence of a release of hydrocarbons on shipping is Slight (E).

Industry

A change in water quality and change to the functions, interests or activities of other users may impact industry following an unplanned hydrocarbon release, summarised from Section 7.2.6.2 of the Scarborough OPP (SA0006AF0000002, Rev 5) as follows:

- In the event of a major hydrocarbon spill, an exclusion zone may be established around the spill affected area. This could result in exclusion of other users such as vessels used by the mining and petroleum industries.
- The closest oil and gas development to the Scarborough field is Chevron Australia’s Jansz lo fields, about 100 km to the east. However, all infrastructure is subsea and is not expected to be impacted by a marine diesel spill.

Defence

A change to the functions, interests or activities of other users may impact Defence following an unplanned hydrocarbon release as follows:

- In the event of a major hydrocarbon spill, an exclusion zone may be established around the spill affected area. This could impact Defence by restricting areas where training or exercises can be conducted, for a designated period of time.
- Any exclusion zone established would be limited to the immediate vicinity of the release point, and due to the rapid weathering of marine diesel would only be in place for days after release, therefore physical displacement to vessels is unlikely to be a significant impact.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity	Consequence	Likelihood	Risk Rating
Water quality	Change in water quality	Low value (open water)	Negligible (F)	Highly Unlikely	Low
Plankton	Injury/mortality to fauna	Low value (open water)	Negligible (F)	Highly Unlikely	Low
Fish, sharks and rays	Change in fauna behaviour	High species value	Minor (D)	Highly Unlikely	Moderate
	Injury/mortality to fauna		Minor (D)	Highly Unlikely	Moderate
Marine mammals	Change in fauna behaviour	High species value (i.e. pygmy blue whale)	Minor (D)	Highly Unlikely	Moderate
	Injury/mortality to fauna		Minor (D)	Highly Unlikely	Moderate
Marine reptiles	Change in fauna behaviour	High species value (i.e. flatback, green and hawksbill turtles)	Slight (E)	Highly Unlikely	Low
	Injury/mortality to fauna		Minor (D)	Highly Unlikely	Moderate
Seabirds and migratory shorebirds	Change in fauna behaviour	High species value	Slight (E)	Highly Unlikely	Low
	Injury/mortality to fauna		Minor (D)	Highly Unlikely	Moderate
Coral	Change in habitat	High value habitat	Major (B)	Highly Unlikely	Moderate
Seagrass	Change in habitat	High value habitat	Slight (E)	Highly Unlikely	Low
Macroalgae	Change in habitat	Low value habitat (homogenous)	Negligible (F)	Highly Unlikely	Low

Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
the activity 24-48 hours before operations commence.	CS: Minimal cost. Standard practice.	Program to other marine users ensures they are informed and aware, thereby reducing the likelihood of a collision with a third party vessel occurring.	Control is also Standard Practice.	
Mitigation: oil spill response	Refer to Appendix D.			
Professional Judgement – Eliminate				
Eliminate use of vessels.	F: No. The use of vessels is required to conduct the Petroleum Activities Program. CS: Not considered – control not feasible.	Not considered – control not feasible.	Not considered – control not feasible.	No
Professional Judgement – Substitute				
No additional controls identified.				
Professional Judgement – Engineered Solutions				
No additional controls identified.				
ALARP Statement				
On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.4.2), Woodside considers the adopted controls appropriate to manage the risks and consequences of an unplanned loss of hydrocarbon as a result of vessel collision. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are considered ALARP.				

Demonstration of Acceptability
Acceptability Criteria and Assessment
The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5):
<ul style="list-style-type: none"> Overall risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP. EPOs and controls in the Scarborough OPP that are relevant to an unplanned hydrocarbon release from a vessel collision have been adopted. There are no changes to internal/external context specific to this risk from the Scarborough OPP. Hydrocarbon spills were raised during stakeholder consultation (Appendix F, Table 1) and these were considered in the finalisation of the EP. <ul style="list-style-type: none"> Following consultations with DNP on the potential risks to AMPs, the DNP noted it has no objections and claims at this time.
Acceptability Statement:
The impact assessment has determined that an accidental hydrocarbon release as a result of a vessel collision represents a moderate current risk rating and is unlikely to result in a risk consequence greater than Major (corals). Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activities Program is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice. The adopted controls are considered consistent with industry legislation,

codes and standards, good practice and professional judgement and meet the requirements and expectations of Australian Marine Orders, AMSA and AHO identified during impact assessment and stakeholder consultation. Further opportunities to reduce the impacts have been investigated above. The potential risks and consequences are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks and consequences of a loss of vessel structural integrity to a level that is acceptable if ALARP.

Loss of hydrocarbons to marine environment from bunkering/ refuelling			✓			✓		A	F	2	L	LC S GP PJ	Broadly Acceptable	EPO 20
Description of Source of Impact/Risk														
<p>Bunkering of marine diesel may occur within the Operational Area. Three credible scenarios for the loss of containment of marine diesel during bunkering operations have been identified:</p> <ul style="list-style-type: none"> Partial or total failure of a bulk transfer hose or fittings during bunkering, due to operational stress or other integrity issues could spill marine diesel to the deck and/or into the marine environment. This would be in the order of less than 200 L, based on the likely volume of a bulk transfer hose (assuming a failure of the dry break and complete loss of hose volume). Partial or total failure of a bulk transfer hose or fittings during bunkering, combined with a delay to shutoff fuel pumps, for a period of up to 15 minutes at a maximum transfer rate of 220 m³/hr for the PV, resulting in approximately 55 m³ (55,000L) marine diesel loss as to the deck and/or into the marine environment. Partial or total failure of a bulk transfer hose or fittings during helicopter refuelling could spill aviation jet fuel to the helicopter deck and/or into the marine environment. All helicopter refuelling activities are closely supervised and leaks on the helideck are easily detectable. In the event of a leak, transfer would cease immediately. The credible volume of such a release during helicopter refuelling would be in the order of <100 L. <p>Likelihood</p> <p>Woodside spill records indicates that while there have been smaller releases (<30 L) associated with bunkering, there have been no recorded partial or total failures of bulk transfer hose or fittings during bunkering, combined with a failure in procedure to shut off fuel pumps for a period of up to five minutes, resulting in the worst case credible scenario of an 8 m³ loss of diesel.</p> <p>International Tanker Owners Pollution Federation Limited (IOTPF) (2020) data reports that for tanker operations during 1970-2017, 7% of small (<7 tonnes) spills occurred during bunkering and 2% of medium (7-700 tonnes) spills. Whilst this data is from the oil tanker industry it has been used as an indicator of potential for spills associated with bunkering activities. A risk assessment by AMSA of oil spills in Australian ports and waters (Det Norske Veritas, 2011) identifies transfer spills as a risk.</p> <p>Quantitative Spill Risk Assessment</p> <p>Exposure to threshold concentrations from a 55,000 L surface spill from bunkering activities would be well within the EMBA for the vessel collision scenario detailed in Section 6.8.2. Given this, the offshore location of the Operational</p>

Area, and the fact that the same hydrocarbon type is involved for both scenarios, specific modelling for an 55,000 L marine diesel release was not undertaken for this Petroleum Activities Program.

Given the physical and chemical similarities, and the relatively small credible spill volumes, marine diesel is considered to be a suitable substitute for aviation jet fuel for the purposes of this environmental risk assessment. Aviation jet fuel would behave similarly to diesel and have similar impacts and, considering small spill volumes likely to be contained on the helideck, this was not modelled.

Hydrocarbon Characteristics

Refer to Section 6.8.2 for a description of the characteristics of marine diesel, including detail on the predicted fate and weathering of a spill to the marine environment.

Detailed Impact Assessment

Assessment of Potential Impacts

An unplanned hydrocarbon release during bunkering has the potential to result in the following impacts:

- change in water quality
- change in fauna behaviour

A 55 m³ (55,000L) marine diesel surface release as a result of bunkering activities is expected to be confined to within several kilometres of the release site, and well within the EMBA identified for the vessel collision scenario detailed in Section 6.8.2.

In the unlikely event of an unplanned hydrocarbon release from bunkering, the limited volume may lead to minor impacts to megafauna, plankton and fish populations (surface and water column biota) that are within the spill affected area, minor impacts to commercial fisheries may also occur.

The potential biological and ecological impacts associated with much larger hydrocarbon spills (i.e. vessel collision) are presented in Section 6.8.2 and include behavioural changes to fish, marine mammals and marine reptiles. The extent of the EMBA associated with a marine diesel spill from bunkering will be much reduced in terms of spatial and temporal scales, and hence, potential impacts from bunkering are considered negligible.

It is recognised that depending on the location and timing of a bunkering spill along the trunkline route there is variation in potential spatial and temporal environmental sensitivity. For example, the trunkline traverses a number of BIAs for marine species protected under the EPBC Act that may be seasonally present in the Operational Area, including migration BIAs for humpback whales and pygmy blue whales, a foraging BIA for whale sharks and breeding and nesting BIAs for marine turtles and seabirds. The trunkline route also traverses the Montebello Marine Park between KP 109 and KP 192. The North-west Marine Parks Network Management Plan (DNP, 2018a) lists the natural values of the Montebello AMP as including a range of threatened, migratory, marine or cetacean species listed under the EPBC Act, including overlapping BIAs. A bunkering spill may result in changes in marine fauna behaviour or injury/mortality may occur due to direct contact or a change in water quality leading to indirect impacts in the localised vicinity of the spill. As outlined in the ALARP evaluation below, refuelling of the PV in the Montebello Marine Park will be preferentially avoided. If refuelling in the Montebello Marine Park is able to be avoided, it removes the spill risk during bunkering and would reduce the consequence to more sensitive marine receptors, compared to other areas of the Petroleum Activities Program.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity	Consequence	Likelihood	Risk Rating
Water quality	Change in water quality	Low value (open water)	Negligible (F)	Unlikely	Low
Fish, sharks and rays	Change in fauna behaviour	High species value	Negligible (F)	Unlikely	Low
Marine mammals	Change in fauna behaviour	High species value (i.e. pygmy blue whale)	Negligible (F)	Unlikely	Low
Marine reptiles	Change in fauna behaviour	High species value (i.e. flatback, green and hawksbill turtles)	Negligible (F)	Unlikely	Low
	Injury/mortality to fauna		Negligible (F)	Unlikely	Low

Overall Impact Significance Level/ Risk Consequence: The overall impact significance level/risk rating for an unplanned hydrocarbon release resulting from a bunkering incident is Low based on a Negligible consequence to the most high value receptors (marine fauna). The risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP.

	<p>It is not operationally practical to transit vessels back to port for refuelling based on the frequency of the refuelling requirements and potential maximum distance from the nearest port.</p> <p>CS: Significant due to schedule delay, Trunkline integrity and vessel transit costs / risks, increased emissions and day rates.</p>			
Professional Judgement – Substitute				
No additional controls identified.				
Professional Judgement – Engineered Solutions				
No additional controls identified.				
<p>ALARP Statement:</p> <p>On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.3.3), Woodside considers the adopted controls appropriate to manage the risks and consequences of an unplanned loss of hydrocarbon as a result of a bunkering incident. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are considered ALARP.</p>				

Demonstration of Acceptability
Acceptability Criteria and Assessment
<p>The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5):</p> <ul style="list-style-type: none"> • Overall risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP. • EPOs and controls in the Scarborough OPP that are relevant to an unplanned hydrocarbon release from bunkering have been adopted. • There are no changes to internal/external context specific to this risk from the Scarborough OPP, including issues raised during stakeholder consultation.
<p>Acceptability Statement:</p> <p>The impact assessment has determined that accidental discharge of hydrocarbons from bunkering represents a low current risk rating and is unlikely to result in a risk consequence greater than Negligible. BIAs for 20 EPBC Act listed Threatened or Migratory species overlap the Operational Area or EMBA. Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activities Program is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice. The adopted controls are considered consistent with industry legislation, codes and standards, good practice and professional judgement and meet the requirements and expectations of Australian Marine Orders identified during impact assessment.</p> <p>Further opportunities to reduce the impacts have been investigated above. The potential risks and consequences are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks of a loss of hydrocarbons during bunkering / refuelling to a level that is broadly acceptable.</p>

6.8.4 Unplanned Discharge – Deck and Subsea Spills

Scarborough OPP – Relevant Impact Assessment Section														
Section 7.2.1 – Unplanned Discharge: Chemicals														
Context														
Relevant Activities Vessel Operations – Section 3.7 ROV Operations – Section 3.8.3			Existing Environment Marine Regional Characteristics – Section 4.2 Habitats and Biological Communities – Section 4.5				Stakeholder consultation Consultation – Section 5							
Impact/Risk Evaluation Summary														
Source of Impact/Risk	Environmental Value Potentially Impacted						Evaluation							
	Soil and Groundwater	Marine Sediment	Water Quality	Air Quality (inc. odour)	Ecosystems / Habitat	Species	Socio-economic	Decision Type	Impact/Consequence	Likelihood	Current Risk Rating	ALARP Tools	Acceptability	Outcome
Accidental discharge of hydrocarbons/chemicals from project vessels deck activities and equipment, and from subsea ROV hydraulic leaks			✓			✓		A	E	1	L	LC SGP PJ	Broadly Acceptable	EPO 3
Description of Source of Impact/Risk														
<p>Vessel Operations</p> <p>Hydrocarbons/chemicals are used during vessel and ROV activities for a variety of purposes within the Operational Area. Spills may include:</p> <ul style="list-style-type: none"> Chemicals (maintenance and cleaning chemicals). Generally held onboard in low quantities (typically <50 L containers). Spills of these chemicals may result from human error or damage to a chemical container during handling. In the event that a spill is not contained on deck or within a bunded area, there would be a release to the marine environment of up to 50 L. Hydraulic fluids used in machinery (including cranes, winches, ROVs, TSHD drag head, pipelay stinger). Unplanned discharges are predominantly due to failure of hydraulic hoses or minor leaks from process components, or spills during periodic refuelling of hydraulic hoses. Volumes of hydraulic fluids contained in ROV hydraulic hoses to be used can be up to approximately 400 L, while hydraulic fluids contained in hoses of key equipment may be in the order of 2 m³. Operational experience demonstrates that spills are most likely to originate from hydraulic hoses and have been less than 100 L, with a typical volume of <20 L (based on capacity of hydraulic hose). All equipment is subject to planned maintenance as preventative measures against unplanned spills. <p>Survey Equipment</p> <p>Survey vessels will place equipment on the seabed which may contain relatively small volumes of hydraulic fluid, about 5-10 L, depending on the system. The hydraulic fluid enables various mechanical functions to be performed. If a Boomer, Chirp or Sparker system is used, the receiver will consist of individual hydrophone elements located within neutrally buoyant, synthetic hydrocarbon filled tubing. The hydrophone cable has the potential to be punctured, resulting a leakage of fluid for a variety of reasons, including damage during deployment or retrieval.</p>

Detailed Impact Assessment
<p>Assessment of Potential Impacts</p> <p>Water Quality</p> <p>Unplanned discharges of non-process chemicals and hydrocarbons may decrease the water quality in the immediate vicinity of the release. Only small volumes (<20 L) are anticipated, resulting in very short-term impacts to water quality, and limited to the immediate release location.</p> <p>The open water location and relatively small unplanned volumes of hydrocarbons/chemicals released will result in rapid dilution close to the source of discharge.</p> <p>Given the occasional nature of unplanned deck and subsea discharges, the small volumes, and the offshore location of the Operational Area, any changes to water quality are expected to have no lasting effects.</p> <p>Marine Fauna</p> <p>As a result of a change in water quality, further impacts to receptors may occur, which include injury or mortality to marine fauna resulting from exposure to toxins in the released chemicals. Physical coating of marine fauna and sub-lethal or lethal toxic effects from hydrocarbons/chemicals are considered unlikely given the low volumes of potential discharge, short exposure times and the rapid dilution and dispersion of discharges once entering the marine environment. Impacts to marine fauna are expected to be limited to temporary irritation of sensitive membranes to individuals and are considered negligible.</p>

Summary of Assessment Outcomes					
Receptor	Impact	Receptor Sensitivity	Consequence	Likelihood	Risk Rating
Water quality	Change in water quality	Low value (open water)	Negligible (F)	Highly Unlikely	Low
Migratory Shorebirds and Seabirds	Injury/mortality to fauna	High value species	Slight (E)	Highly Unlikely	Low
Fish		High value species	Slight (E)	Highly Unlikely	Low
Marine Mammals		High value species	Slight (E)	Highly Unlikely	Low
Marine Reptiles		High value species	Slight (E)	Highly Unlikely	Low
		High value species	Slight (E)	Highly Unlikely	Low
<p>Overall Risk Consequence: The overall risk consequence/risk rating for an unplanned deck and subsea spills is Low based on no lasting effect to the high value receptors (marine fauna). The risk consequence/risk ratings for water quality is consistent with the levels rated in the Scarborough OPP. Potential impacts to marine fauna have been additionally assessed in this EP. There is no change in risk rating (low); however, the risk consequence is slightly higher due to the higher receptor sensitivity level.</p>

Seabirds and Migratory Shorebirds, Fish, Marine Reptiles and Marine Mammals

Injury/Mortality to Fauna

The unplanned discharge of solid wastes can result in injury or mortality to fauna, either through contamination or physical injury depending on the nature of the waste. Ingestion or entanglement of marine fauna has the potential for physical harm, which may limit feeding/foraging behaviours and thus can result in mortalities. Injury and fatality to vertebrate marine life caused by ingestion of, or entanglement in, harmful marine debris was listed as a key threatening process under the EPBC Act in August 2003 (Commonwealth of Australia, 2018). The Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia’s coasts and oceans (Commonwealth of Australia, 2018) identifies EPBC Act-listed species for which there are scientifically documented adverse impacts resulting from marine debris. Marine turtles and seabirds in particular may be at risk from plastics, which may cause entanglement or be mistaken for food (e.g. Commonwealth of Australia, 2018; Commonwealth of Australia, 2017a) and ingested causing damage to internal tissues and potentially preventing feeding activities. In the worst instance this could have a lethal affect to an individual. Marine debris has been identified as threat in the Recovery Plan for Marine Turtles in Australia (2017–2027).

Impacts to species including fish, birds, marine mammals and marine reptiles from the unplanned discharge of solid waste is unlikely given low occurrence of unplanned discharges. Significant impacts are unlikely to occur at an individual level and will not occur at a population level, nor result in the decrease of the quality of the habitat such that the extent of these species is likely to decline.

While, the threat abatement plan for impacts of marine debris on vertebrate marine life does not list explicit management actions for non-related industries (DEWHA, 2009), management controls will reduce the risk of unplanned discharge of solid waste.

The temporary or permanent loss of waste materials into the marine environment is not likely to have a significant environmental impact, based on the types, size and frequency of wastes that could occur. The magnitude of potential impact to marine fauna is Slight, which results in a consequence of Minor (D) based on the high receptor sensitivity.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity	Risk Consequence	Likelihood	Risk Rating
Water quality	Change in water quality	Low value (open water)	Negligible (F)	Remote	Low
Fish, sharks and rays	Injury/mortality to marine fauna	High value species (e.g. whale shark)	Minor (D)	Remote	Low
Marine mammals		High value species (e.g. pygmy blue whale)	Minor (D)	Remote	Low
Marine reptiles		High values species (e.g. flatback, green and hawksbill turtle)	Minor (D)	Remote	Low
Seabirds and migratory shorebirds		High value species	Minor (D)	Remote	Low

Overall Risk Consequence: The overall risk consequence/risk rating for unplanned discharge of waste is Low based on a Minor consequence to the high value receptors (marine fauna). The risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP.

ALARP Statement:				
On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.3.3), Woodside considers the adopted controls appropriate to manage the risks and consequences of unplanned discharge of waste. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are considered ALARP.				

Demonstration of Acceptability
Acceptability Criteria and Assessment
The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5): <ul style="list-style-type: none"> Overall risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP. EPOs and controls in the Scarborough OPP that are relevant to an unplanned release of hazardous and non-hazardous wastes have been adopted. There are no changes to internal/external context specific to this risk from the Scarborough OPP, including issues raised during stakeholder consultation.
Acceptability Statement:
The impact assessment has determined that unplanned discharges from a release of solid hazardous and non-hazardous wastes represents a low current risk rating and is unlikely to result in a risk consequence greater than Minor. A number of BIAs for EPBC Act listed Threatened or Migratory species overlap the Operational Area. Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activities Program is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice. The adopted controls are considered consistent with industry legislation, codes and standards, good practice and professional judgement and meet the requirements of Australian Marine Orders identified during impact assessment.
Further opportunities to reduce the impacts have been investigated above. The potential risks and consequences are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks and consequences of an unplanned discharge of hazardous and non-hazardous solid waste / equipment to a level that is broadly acceptable.

Description of Source of Impact/Risk

Seabed Disturbance outside the Designated Area

- Trunkline trenching, spoil disposal and backfill activities may occur outside of the designated area as a result of operator error, equipment failure, unplanned movement of the seabed, adverse weather conditions or sea states and in the event of contingency activities.
- Dredging outside Offshore Borrow Ground Project Area may occur as a result of operator error, adverse weather conditions or sea states.
- Rock berm placement, span rectification and other seabed intervention activities may occur outside of the designated project footprint, as a result of operator error, adverse weather conditions or sea states.
- Unplanned seabed disturbance during continental slope preparation and excavation activities could result from turbid flow due to the mobile nature of the seabed soft sediments, coupled with the slope angle.
- Anchoring of SWLB outside predetermined safe zones may occur outside of the designated area as a result of operator error, adverse weather conditions or sea states.
- Contingent Trunkline installation activities: The trunkline may need to be abandoned and retrieved multiple times throughout installation as a result of adverse sea states, cyclones, or mechanical issues with pipelay (Section 3.13.3). Abandonment must occur within a straight line, therefore if abandonment occurs at a bend in the trunkline route, lay-down on the seabed may occur outside of the expected trunkline footprint. The catenary of trunkline to be abandoned is nominally 2.5 times the water depth. The trunkline will be retrieved and thus impacts to the seafloor will be temporary in nature.

Dropped Objects

There is the potential for objects to be dropped overboard from project vessels to the marine environment. Objects that have been dropped during previous offshore activities include small numbers of personal protective gear (e.g. glasses, gloves, hard hats), small tools (e.g. spanners) and hardware fixtures; however, there is also potential for larger equipment to also be dropped during the activity. The spatial extent in which dropped objects can occur is restricted to the Operational Area.

While the PV is installing the Trunkline over existing pipelines (third party infrastructure) via pre-installed rock berm crossings, there is a risk (low likelihood) for dropped lengths of pipe during lined pipe transfer activities, which may damage or rupture existing pipelines. There is also a very low likelihood risk that the catenary may be dropped while in the vicinity of third-party assets.

Temporary mooring

In the event of a contingency activity (Section 3.13) the PV may be required to temporarily moor on location via anchor. The expected footprint of seabed disturbance due to setting the anchor is minimal, due to activity being short term. Impacts are likely to be constrained to the area and temporary. Typically, the PV uses DP to remain in location.

Detailed Impact Assessment

Assessment of Potential Impacts

It is expected that any unplanned seabed disturbance would be within the 12.9 km² seabed disturbance calculation, as defined within the Scarborough OPP (SA0006AF0000002, Rev 5), based on an average 30 m trunkline disturbance corridor, along the length of the trunkline (430 km).

Water and Sediment quality

Water quality change occurs when seabed sediments enter the water column (turbidity). Turbidity may occur during any activity which requires contact with, or occurs in close proximity to, the seabed. After a period, the suspended sediments settle and the turbidity in the water column returns to pre-disturbance levels. Sediment sampling along the proposed pipeline route has demonstrated that sediments are suitable for unconfined ocean disposal with results indicating that all levels of potential contaminants of concern were below the NAGD (2009) screening levels. Therefore, sediments to be dredged (and suspended during operations) are considered to be uncontaminated and thus no toxicological impacts to water and sediment from the resuspension of contaminants are predicted.

Impacts from unplanned seabed disturbance outside the designated area on water and sediment quality will be slight. Receptor sensitivity of water quality is low (low value, open water), and impacts are expected to be localised.

Epifauna and Infauna

The seafloor within the region is understood to comprise of soft sediments for the majority, with the presence of a rock pinnacle field at 300 m depth. The pinnacles are isolated forms, approximately 360 m south of the trunkline at KP206, and do not constitute a continuous reef, however provide habitat for a diverse range of epifaunal and demersal species that commonly occur across the NWMR, as well as a low density of soft corals on top. Epifauna and benthic habitats are likely to be sparse, comprising of ascidians, sponges, invertebrate communities and octocorals representative of the

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

wider region, as well as larger motile organisms (demersal fish, shrimp, sea cucumbers etc.) and infauna (i.e. polychaetes) (Section 4.5). These communities are well represented through the region, and any impacts are likely to be at a localised proportion of communities (Keesing, 2019; Advisian, 2019a).

The proposed trunkline route avoids areas of potentially high diversity, relative to the surrounding area such as the rock pinnacles. However, should seabed disturbance occur outside of the designated area as a result of trunkline abandonment or incorrect trunkline installation or dredging, backfill activities or spoil disposal, there may be a localised impact on benthic communities that may occur within the wider Operational Area. Dropped objects and temporary mooring can disturb the seabed, resulting in habitat change and alter communities. If not recovered due to health and safety, operational constraints or other factors, dropped objects may result in a small permanent loss of habitat under the object. In most cases, these objects will be able to be recovered and the impacts will be temporary in nature.

KEFs

Three KEFs overlap the Trunkline Project Area; the Exmouth Plateau, Ancient Coastline at 125 m Depth and Continental Slope Demersal Fish Community. Unplanned disturbance may lead to localised and temporary change in habitat and subsequent localised impact on benthic communities.

The Trunkline Project Area enters the Exmouth Plateau KEF about 240 km offshore (Figure 4-15) within water depths of about 1100 m, extending about 60 km into the KEF. The Ancient Coastline at 125 m Depth KEF overlaps the Trunkline Project Area, located about 360 km offshore (Figure 4-15), north-north-west of the Montebello Islands. Trunkline trenching, backfill and slope crossing excavation will not occur in these KEFs; any unplanned seabed disturbance will be restricted to the small footprint of an object potentially dropped and will be highly localised. Impact will not occur to the hard substrates of the KEF. Physical habitat modification is not listed as a potential concern for this KEF.

The Continental Slope Demersal Fish Community is recognised as a KEF because of its biodiversity values, including high levels of endemism (DAWE, 2020). The Trunkline Project Area intersects a small portion of the KEF (Figure 4-15), across one of its thinnest points throughout its distribution. Physical habitat modification is listed as a potential concern for this KEF (DAWE, 2020). Trunkline trenching, backfill and slope crossing excavation will not occur in this KEF, any potential impact to the KEF from unplanned habitat disturbance is restricted to the footprint of a dropped object and will be highly localised.

AMPs

The offshore borrow ground dredging will occur adjacent to the Dampier Marine Park. A planned 250 m buffer is in place, as described in Section 6.7.2. Should dredging occur outside of the designated areas it is not anticipated to be at a significant distance and impacts will remain within this buffer zone (i.e. seabed disturbance will not be within the Dampier Marine Park or outside of the modelled impact area (Section 6.7.2)). Elevated suspended sediment concentrations (SSCs) and hence detectable changes in water quality may occur within the Dampier Marine Park, however this will be temporary and not expected to modify, destroy, fragment, isolate or disturb an important or substantial area of habitat.

The Trunkline Project Area intersects the Montebello Marine Park between KP 109 to KP191 and within this area span rectification for three infrastructure crossings will occur. There is the potential for these activities to occur outside of their designated areas. Dominant benthic organisms recorded within the section of the Trunkline Project Area intersecting the Marine Park have included a wide variety of sponges and soft corals including whips and gorgonians, hydroids, seapens and crinoids (Advisian, 2019a), however these are typical of the benthos found both within the Marine Park (Advisian, 2019a) and regionally (Keesing, 2019). The footprint of free span rectification is extremely small in comparison with the spatial extent of these communities in the north western section of the Montebello Marine Park, the any unplanned seabed disturbance will not destroy, fragment, isolate these communities.

Unplanned seabed disturbance, should it increase suspended sediment concentrations within the Montebello Marine Park, does have the potential to indirectly affect filter feeder-sponge habitat. However, a minor temporary increase in suspended sediments at the seabed associated with an unplanned seabed disturbance within the Montebello Marine Park would not reach the intensity and duration terms of the impact thresholds, as discussed in Section 6.7.2 and thus no impacts are predicted beyond the direct footprint.

Summary of Assessment Outcomes					
Receptor	Impact	Receptor Sensitivity	Consequence	Likelihood	Risk Rating
Water quality	Change in water quality	Low value	Negligible (F)	Highly Unlikely	Low
Sediment quality	Change in sediment quality	Low value	Negligible (F)	Highly Unlikely	Low
Epifauna and infauna	Change in habitat Injury/mortality to marine fauna	Low value	Negligible (F)	Highly Unlikely	Low
KEFs	Change in habitat	High Value	Minor (D)	Highly Unlikely	Moderate
AMPs	Change in habitat	High Value	Minor (D)	Highly Unlikely	Moderate

Overall Risk Consequence: The overall risk consequence/risk rating for unplanned seabed disturbance is Moderate based on a Minor consequence to the high value receptors (KEFs, AMPs). The risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP.

Demonstration of ALARP

multibeam data and no-rock zones <ul style="list-style-type: none"> Installation weather limitations if required 				
Professional Judgement – Eliminate				
Different rigging designs will be assessed to reduce likelihood of dropped pipe from issues such as sling slippage and will consider the use of spreader bars	F: Yes. CS: Monetary cost of system design and installation.	Use of rigging can reduce the likelihood of sling slippage and as a result, dropped pipes	Benefits outweigh cost/sacrifice.	Yes C 13.6
Third party asset crossings - rock sizing to be designed to not rupture hydrocarbon containing facilities should a mis-dump occur.	F: Yes CS: Minimal cost. Good Practice.	Reducing rock sizing to that which will not rupture existing third party pipelines eliminates the risk of pipeline rupture from rock mis-dumping	Benefits outweigh cost/sacrifice.	Yes. Adopted in current design.
Lifting activities between vessels to be carried out in accordance with requirements of third-party crossing agreement / permitting including implementation of lifting exclusion zone(s).	F: Yes. CS: Minimal cost. Standard practice.	By lifting pipe away from the existing third party infrastructure there is no potential for a dropped pipe to damage existing third party infrastructure.	Benefits outweigh cost/sacrifice.	Yes C 13.10
Professional Judgement – Substitute				
No additional controls identified.				
Professional Judgement – Engineered Solutions				
No additional controls identified.				
ALARP Statement: On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.3.3), Woodside considers the adopted controls appropriate to manage the risks and consequences of unplanned seabed disturbance. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are considered ALARP.				

Demonstration of Acceptability
Acceptability Criteria and Assessment
The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5): <ul style="list-style-type: none"> Overall risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP. EPOs and controls in the Scarborough OPP that are relevant to an unplanned seabed disturbance have been adopted. There are no changes to internal/external context specific to this risk from the Scarborough OPP, including issues raised during stakeholder consultation.
Acceptability Statement:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

The impact assessment has determined that disturbance to seabed from dropped objects or seabed disturbance outside the designated area represents a moderate current risk rating and is unlikely to result in a risk consequence greater than Minor. The adopted controls are considered consistent with industry good practice and professional judgement.

Further opportunities to reduce the impacts have been investigated above. The potential risks and consequences are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks and consequences of unplanned seabed disturbance to a level that is broadly acceptable.

within the Operational Area are likely to be travelling <8 knots (and will often be stationary), unless operating in an emergency. At times, vessels will be transiting within the Operational Area or to and from supply base where speed could be up to a maximum of about 15 knots, however are transitory through the area.

TSHD Activities

Dredging and trenching activities within the Trunkline Project Area and Offshore Borrow Ground Project Area have the potential to entrain fish and protected marine fauna such as marine turtles, through the unintentional removal of organisms by the suction field created by the TSHD (Reine and Clarke, 1998). Entrainment rates depend on a number of factors, including depth, dredger type, speed, and strength of suction field (Todd et al., 2014). The TSHD will sail slowly, typically at 1-1.5m/s during trunkline and borrow ground dredging.

Detailed Impact Assessment

Assessment of Potential Impacts

Unplanned interaction with marine fauna has the potential to occur within the Operational Area. There are a number of EPBC listed species with the potential to occur within the Operational Area (Section 4.6). It is recognised that there is both spatial and temporal variation in the potential for interaction with marine fauna. For example, the trunkline traverses a number of BIAs for marine species protected under the EPBC Act that may be seasonally present in the Operational Area, including migration BIAs for humpback whales and pygmy blue whales, a foraging BIA for whale sharks and breeding and nesting BIAs for marine turtles and seabirds. The trunkline route also traverses the Montebello Marine Park between KP 109 and KP 192. The North-west Marine Parks Network Management Plan (DNP, 2018a) lists the natural values of the Montebello AMP as including a range of threatened, migratory, marine or cetacean species listed under the EPBC Act, including overlapping BIAs. The BIAs and Habitat Critical to the survival of the species that overlap the Operational Area are summarised below:

- A pygmy blue whale migration BIA overlaps with deeper waters within the Trunkline Project Area. There is a higher likelihood of pygmy blue whale presence from April–July and October–January during their seasonal migrations. This BIA overlaps the location of continental slope crossing seabed preparation activities.
- A humpback whale migration BIA overlaps with the Operational Area. Humpback whales are expected to be most frequently encountered during pipelay and during the trenching and material disposal and Offshore Borrow Ground dredging and backfill, particularly during annual migrations ((July (northbound) and late August/September (southbound)).
- Flatback, green and hawksbill turtle internesting buffer BIAs and internesting Habitat Critical, and loggerhead turtle internesting buffer BIAs overlap with the Operational Area. Activities in proximity to these locations include pipelay and the works along the trunkline route (KP 32 to KP 50), including cycling of dredging and backfill between the Offshore Borrow Ground Project Area, Trunkline Project Area (KP 32 to KP 50), and disposal of material in Spoil Ground 5A.
- A whale shark foraging BIA overlaps the Trunkline Project Area at ~KP 72 to KP 199. Activities within the BIA are limited to pipelay, span rectification and surveys.

Marine Mammals/Cetaceans

Cetaceans are naturally inquisitive marine mammals. The reaction of cetaceans to the approach of a vessel is quite variable. Some species remain motionless when close to a vessel, while others are known to be curious and often approach ships that have stopped or are slow moving, although they generally do not approach and sometimes avoid faster moving ships (Richardson et al., 1995). The Whale and Dolphin Conservation Society (WDCS, 2006), indicates that some cetacean species, such as humpback whales, can detect and change course to avoid a vessel.

Collisions between vessels and marine mammals occur more frequently in areas where high vessel traffic and important habitat coincide (WDCS, 2006). In Australia, the majority of vessel strikes to known species involved humpback, southern right whale and sperm whales, in descending order (Peel et al., 2016). Van Warebeek et al. (2007) reported five blue whale ship strikes in the Southern Hemisphere. No vessel strike collisions were reported in the northern coast of Australia (Peel et al., 2016). The behaviour exhibited by whales prior to vessel collision varies, with some reported as being asleep/unmoving prior to the collision (Peel et al., 2016) and others displaying a ‘last-second flight response’ (Laist et al., 2001). Individual cetaceans engaged in behaviours such as feeding, mating or nursing may also be more vulnerable to vessel collisions when distracted by these activities (Commonwealth of Australia, 2017b).

The likelihood of vessel/whale collision being lethal is influenced by vessel speed—the greater the speed at impact, the greater the risk of mortality (Jensen and Silber, 2004; Laist et al., 2001). Vanderlaan and Taggart (2007) found that the chance of lethal injury to a large whale as a result of a vessel strike increases from about 20% at 8.6 knots to 80% at 15 knots. The risk of lethal injury to a large whale as a result of vessel strike is less than 10% at a speed of 4 knots (Vanderlaan and Taggart, 2007). Vessel-whale collisions at this speed are uncommon and, based on reported data contained in the NOAA database (Jensen and Silber, 2004) there only two known instances of collisions when the vessel was travelling at less than 6 knots; both of these were from whale-watching vessels that were deliberately positioned amongst whales.

The Conservation Management Plan for the blue whale identify vessel disturbance and strike as a threat to the EPBC listed species (Commonwealth of Australia, 2015a; TSSC, 2015b).

The risk of vessel collision with marine mammals is present year-round but is seasonally elevated for species such as humpback whales and pygmy blue whales during migration periods and within migration BIAs. The Operational Area for the Petroleum Activities Program intersects the pygmy blue whale migration BIA (from KP200km to KP274), and also overlaps with the broader pygmy blue whale distribution range (refer to Figure 4-12). Considering this overlap, as well as the recorded presence and satellite tracking of both north and south bound tagged individuals in the Operational Area (Thums et al. (2022)), it is likely that transient individuals or small groups are occasionally in and around the Operational Area during migratory north and south seasons (April to July and October to January, respectively) (McCauley, 2011; Gavrilov et al., 2018; Thums et al., 2022). Significant numbers of pygmy blue whales are not expected to be encountered, particularly outside peak periods for northbound or southbound migrations (Figure 4-12).

Whilst a portion of the Operational Area also overlaps the humpback whale migration BIA in the NWMR, this overlap represents a very small proportion of the overall area of the BIA (0.22%). Given this limited spatial overlap with the humpback whale migration BIA, the short duration of activities within the Operational Area, and the slow speeds at which project vessels operate (required to be 10 km or less as per C 6.7), collisions with humpback whales are considered highly unlikely. As outlined in Table 4-14, the humpback whale is not a listed threatened species under the EPBC Act, but is a listed Migratory species. Accordingly, there is no recovery plan in place for humpback whales, and no specific requirements with respect to potential impacts within BIAs.

Dugong are known to occur in and around seagrass growth areas. Vessel speed is understood to be the primary factor affecting vessel collision risk (Hodgson, 2004) with evidence showing dugongs fail to flee or evade the approach of fast vessels (Groom et al., 2004). Seagrasses have not been observed within the Operational Area and it is unlikely that large numbers of the species will be present.

The Snubfin dolphin is a coastal species found in inshore shallow waters and is unlikely to be encountered in the Operational Area.

Given the duration of activities within the Operational Area and the slow speeds at which project vessels operate, collisions with marine mammals are considered highly unlikely.

Marine Reptiles

The Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017a) recognises vessel strikes and dredging as key threats to EPBC listed marine turtle species. Dredging activities have the potential to entrain turtles, resulting in superficial or serious injury that may affect life functions, or cause mortality. Marine turtles at the surface or in shallow waters are at risk of vessel collision.

Hazel and Gyuris (2006) reviewed vessel strike data from 1999-2002 on the Queensland east coast and found that during that period at least 65 turtles were killed annually as a result of collisions with vessels. Green turtles, followed by loggerhead turtles comprised the majority of vessel related records, and 72% of cases were adult or sub-adult turtles (Hazel and Gyuris, 2006). In Australian waters, all species of marine turtle have been involved in vessel strikes (Commonwealth of Australia, 2016).

The effect of vessel speed on turtle flee response can be significant. A study by Hazel et al. (2007) found that 60% of green turtles fled from vessels travelling at 2.2 knots (4 km/h) while only 4% fled from vessels travelling at 10.2 knots (19 km/h). When fleeing 75% of turtles moved away from the vessel's track, 8% swam along the vessel track and 18% crossed in front of the vessel. The study concluded that most turtles would be unlikely to avoid vessels travelling at speeds greater than around 2.2 knots (Hazel et al., 2007; Commonwealth of Australia, 2017a). Furthermore, the relatively small size of turtles and the significant time spent below the surface makes their observation by vessel operators extremely difficult or impossible. Green turtles observed by Hazel et al. (2009) generally only exposed the dorsal-anterior part of the head above the surface of the water and not for longer than two seconds.

Dredging activities can be a direct source of impact to marine turtles and other marine fauna if individuals become caught in the dredge equipment (entrainment), or if smothering/burial occurs during spoil disposal or backfill. Entrainment of turtles during dredging may result in injury or mortality (Dickerson et al., 1991). The risk is considerably reduced by use of standard mitigations and protection devices (Dickerson, 2004). The implementation of exclusion zones and observation zones for dredging, spoil disposal and backfilling will minimise the risk of entrainment and smothering/burial of marine turtles. Turtle deflection chains will also be installed to the TSHD drag head to reduce entrainment of turtle during dredging. Potential impacts from dredging are likely to affect individuals rather than cause a population level impact.

Within the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017a) there is reference to undertaking dredging in important internesting habitat outside peak nesting seasons. For the section of trunkline (i.e. KP 32 to KP 50) that requires trenching and backfilling, consideration has been given to fauna mitigation methods such as the seasonal timing to limit disturbance to turtles, this has been considered within the ALARP assessment below.

The Operational Area overlaps with an internesting buffer BIA and Habitat Critical to the survival of flatback turtles. However, it is noted that the BIA and Habitat Critical are considered very conservative as they are based on the maximum range of internesting females, and most marine turtles are more likely to remain near their nesting beaches. The 60 km internesting buffer for flatback turtles in the Recovery Plan for Marine Turtles in Australia (Commonwealth of Australia, 2017a) is based primarily on the movements of tagged internesting flatback turtles along the NWS reported by Whittock et al. (2014), which found that flatback turtles may demonstrate internesting displacement distances up to

62 km from nesting beaches. However, these movements were confined to longshore movements in nearshore coastal waters or travel between island rookeries and the adjacent mainland (Whittock et al., 2014).

Whittock et al. (2016a) more precisely defined flatback turtle internesting habitat along the NWS. This study developed a habitat suitability map to identify areas where internesting flatback turtles may be present along the NWS, based on data compiled for a suite of environmental variables and satellite tracks of 47 internesting flatback turtles from five different mainland and island rookeries tracked over 1289 days. Whittock et al. (2016b) defined suitable interesting habitat as water 0–16 m deep and within 5–10 km of the coastline, while unsuitable internesting flatback habitat was defined as waters >25 m deep and >27 km from the coastline.

The evidence that suitable interesting habitat for flatback turtles is likely to be limited to relatively shallow waters within close proximity of the coastline is further supported by data from satellite telemetry of 11 flatback turtles after nesting on the Lacepede Islands (Thums et al., 2017). This study found that “*During the inter-nesting phase, flatback turtles remained at an average distance of 15.75 ± 12.25 km from West Lacepede Island, in water depths of 16 ± 3 m...*” (Thums et al., 2017).

Thus, there is no evidence to date to indicate flatback turtles swim out into deep offshore waters during the internesting period.

It is acknowledged that an increased number of turtles may be encountered seasonally during the Petroleum Activities Program within the vicinity of offshore islands/archipelagos during internesting/nesting seasons. It is expected that individuals will respond to vessel presence by avoiding the immediate vicinity of the vessels, and combined with low vessel speed, will reduce the likelihood of a vessel-turtle collision or entrainment during dredging activities. In addition, activities within sensitive turtle areas (BIAs and Habitat Critical to the survival) will be conducted over a period of months (Section 4.6.2), further reducing the potential for impact at the individual and population level.

Fish, Sharks and Rays

Boat strike is recognised by the Approved Conservation Advice for *Rhincodon typus* (whale shark) (TSSC, 2015a) as one of the threats to their recovery. Whale sharks are at risk from vessel strikes when feeding at the surface or in shallow waters (where there is limited option to dive). Whale sharks may traverse offshore NWS waters including the Operational Area during their migrations to and from Ningaloo Reef, as demonstrated by acoustic detections of tagged whale sharks at the North Rankin A and Goodwyn A platforms during two periods—June to July and October to January (Thomson et al. 2021) The Operational Area is located at least 215 km from the whale shark foraging (high density prey) BIA adjacent to Ningaloo Reef. The Operational Area overlaps a small proportion of the foraging BIA for whale sharks between about KP 72 and KP 199, and they may be seasonally present between March and November (with the annual peak aggregation at Ningaloo Reef between April and May) (Figure 4-8). The risk of vessel strike may be elevated during this period. However, this overlap represents only 0.15% of the overall area of the whale shark foraging BIA. Accordingly, it is expected that whale shark presence within the Operational Area would not comprise significant numbers and their presence would be transitory and of a short duration. Given the short duration of activities within the Operational Area and the slow speeds at which project vessels operate, vessel collisions with whale sharks are considered highly unlikely.

Smaller fish may also be at risk of injury or mortality from vessels through being caught in thrusters during station keeping operations (i.e. during DP). However, this is unlikely given the low presence of individuals, combined with the avoidance behaviour commonly displayed during station keeping operations.

Dredging activities can be a source of impact to demersal species such as sawfish through potential entrainment or if smothering/burial occurs during spoil disposal or backfill. The implementation of mitigations and protection devices outlined below will the minimise risk of entrainment and/or smothering/burial of demersal species and any impacts are likely to affect individuals rather than cause a population level impact.

Cumulative Impacts

There is potential for some cumulative impacts to marine fauna to occur as a result of overlap with the Scarborough Drilling and Completions Petroleum Activities Program and installation of the PLET, located at the northern extent of the Operational Area. Given the offshore waters and deep water depths (approx. 900 m), interaction with marine fauna is likely to be limited to individuals and/or small groups of transient cetaceans, with potential impacts expected to result in a behavioural disturbance, i.e. avoidance of the project vessels, with no lasting effect.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity	Consequence	Likelihood	Risk Rating
Marine mammals	Injury/mortality to marine fauna	High value species	Slight (E)	Highly Unlikely	Low
Marine reptiles	Injury/mortality to marine fauna	High value species	Slight (E)	Highly Unlikely	Low

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Fish, sharks and rays	Change in fauna behaviour Injury/mortality to marine fauna	High value species	Slight (E)	Highly Unlikely	Low

Overall Risk Consequence: The overall risk consequence/risk rating for interaction with marine fauna is Low based on a Slight consequence to the high value receptors (marine fauna). The risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP.

Demonstration of ALARP

At completion of dredge run (i.e. fill of hopper), stop dredge pumps as soon as practicable after the TSHD drag head is lifted from the seafloor.	F: Yes. Stopping dredge pumps as soon as practicable after the drag head is lifted from the seafloor will reduce likelihood of entrainment. CS: No additional cost	Implementation of this controls will reduce the likelihood of an entrainment and impact to turtle occurring due to stopping dredge once off the seafloor. The consequence is unchanged.	Benefits outweigh cost/sacrifice.	Yes C 14.4

ALARP Statement:

On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.3.3), Woodside considers the adopted controls appropriate to manage the risks and consequences of unplanned interaction with marine fauna. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are considered ALARP.

Demonstration of Acceptability

Acceptability Criteria and Assessment

The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5):

- Overall risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP.
- EPOs and controls in the Scarborough OPP that are relevant to an unplanned seabed disturbance have been adopted.
- There are no changes to internal/external context specific to this risk from the Scarborough OPP. Interactions with marine fauna was raised during stakeholder consultation (Appendix F, Table 1) and these were considered in the finalisation of the EP.

Acceptability Statement:

The impact assessment has determined that, given the adopted controls, a vessel collision with marine fauna represents a low current risk rating that is unlikely to result in a risk consequence to marine fauna greater than Slight. Relevant recovery plans and conservation advice have been considered during the impact assessment, and the Petroleum Activities Program is not considered to be inconsistent with the overall recovery objectives and actions of these recovery plans and conservation advice (Section 6.9.2). The adopted controls are considered consistent with

Description of Source of Impact/Risk														
<p>Vessel Operations</p> <p>During the Petroleum Activities Program, vessels will be transiting to and from the Operational Area, and may mobilise from an Australian port or directly from international waters. Project vessels include dredging, installation and construction vessels, and other support vessels (refer to Section 3.9.2 and 3.9.3).</p> <p>The RIV may mobilise with internationally sourced rock onboard for use during the Petroleum Activities Program. This rock will be sourced from terrestrial based quarries and be subject to the requirements of Biosecurity Act 2015 and other relevant legislation for importation.</p> <p>All vessels are subject to some level of marine fouling whereby organisms attach to the vessel hull. This could particularly occur in areas where organisms can find a good attachment surface (e.g. seams, strainers and unpainted surfaces) or where turbulence is lowest (e.g. niches, sea chests, etc.), although commercial vessels typically maintain anti-fouling coatings to reduce the build-up of fouling organisms. IMS could be present as biofouling on immersible equipment (survey equipment, ROV, TSHD drag head etc.) and could be translocated to the Operational Area and transferred directly to the seafloor or subsea structures where they could establish. Organisms can also be drawn into ballast tanks during onboarding of ballast water as cargo is loaded or to balance vessels under load.</p> <p>Cross contamination between vessels can also occur (e.g. IMS translocated between project vessels) during times when vessels need to be alongside each other.</p>														
Detailed Impact Assessment														
Assessment of Potential Impacts														
IMS are a subset of Non-indigenous Marine Species (NIMS) that have been introduced into a region beyond their natural biogeographic range, resulting in impacts to social/cultural, human health, economic and/or environmental values. NIMS are species that have the ability to survive, reproduce and establish founder populations. However, not all NIMS introduced into an area will thrive or cause demonstrable impacts. The majority of NIMS around the world are relatively

Uncontrolled when printed. Refer to electronic version for most up to date information.														

benign and few have spread widely beyond sheltered ports and harbours. NIMS are only considered IMS when they result in impacts to environmental values and/or have social/cultural, economic and/or human health impacts.

Potential IMS have historically been introduced and translocated around Australia by a variety of natural and human means including marine fouling and ballast water. Potential IMS vary from one region to another depending on various environmental factors such as water temperature, salinity, nutrient levels and habitat type, which dictate their survival and invasive capabilities. IMS typically require hard substrate in the photic zone; therefore, requiring shallow waters to become established. Highly-disturbed, shallow-water environments such as shallow coastal waters, ports and marinas are more susceptible to IMS colonisation, whereas IMS are generally unable to successfully establish in deep water ecosystems and open-water environments where the rate of dilution and the degree of dispersal are high (Williamson and Fitter, 1996; Paulay et al., 2002; Geiling, 2014).

Epifauna and Infauna, Coral, Seagrass and Macroalgae

Epifauna, infauna and benthic habitats are susceptible to impacts from IMS due to the risk of changes to the ecosystem dynamics such as competition for resources and predation. Once introduced, IMS may prey on local species (which had previously not been subject to this kind of predation and therefore not have evolved protective measures against the attack), may outcompete indigenous species for food, space or light and can also interbreed with local species, creating hybrids such that the endemic species is lost. These changes to the local marine environment result in changes to the natural ecosystem.

The deeper offshore open waters of the Operational Area are not conducive to the settlement and establishment of IMS. The Trunkline Project Area and Offshore Borrow Ground Project Area in shallower waters (30 – 40 m) present a slightly increased risk of IMS establishment, however, IMS require hard substrate/features on the seabed to attach to, none of which is present within the Operational Area. Therefore the risk of establishment, whilst credible, is remote given the distance to hard substrates around islands and shoals, to the Borrow Ground. In addition shallower waters represent a very small area of the overall Operational Area.

Industry, Shipping, and Defence

IMS have also proven economically damaging to areas where they have been introduced and established. Such impacts include direct damage to assets (fouling of vessel hulls and infrastructure) and depletion of commercially harvested marine life (e.g. shellfish stocks). IMS have proven particularly difficult to eradicate from areas once established. If the introduction is detected early, eradication may be effective but is likely to be expensive, disruptive and, depending on the method of eradication, harmful to other local marine life. Given the low likelihood of IMS translocation to, and colonisation within the Operational Area, project activities are unlikely to result in establishment of IMS, and as such not adversely affect other marine user activities in the region.

Summary

In support of Woodside’s assessment of the risks and consequences of IMS introduction associated with the Petroleum Activities Program, Woodside conducted a risk and impact evaluation of the different aspects of an IMS translocation. The results of this assessment are presented in Table 6-32.

Table 6-32: Credibility, consequence and likelihood of introducing IMS

IMS Introduction Location	Credibility of Introduction	Consequence of Introduction	Likelihood
Introduced to Operational Area and establishment on the seafloor	Credible There is potential for IMS to be introduced and established in the shallower waters of the Trunkline Project Area and Borrow Ground.	Environment (D) The deeper offshore open waters of the Operational Area are not conducive to the settlement and establishment of IMS. The Trunkline Project Area and Offshore Borrow Ground Project Area in shallower waters (30 – 40 m) present a slightly increased risk of IMS establishment, however, IMS require hard substrate/features on the seabed to attach to, none of which is present within the Operational Area. Therefore the risk of establishment, whilst credible, is remote given the distance to hard substrates around islands and shoals, to the Borrow Ground.	Remote (0) In the deeper areas of the Operational Area establishment of IMS is unlikely to occur on the seabed due to the lack of light or suitable habitat and the areas distance from shorelines and/or critical habitat. The risk is slightly greater in the shallower waters of the Trunkline Project Area and Offshore Borrow Ground Project Area, nearer the State waters boundary; however, the seabed remains featureless and not conducive to the

			settlement and establishment of IMS.
Introduced to Operational Area and establishment on a vessel.	Credible There is potential for the transfer of marine pests between vessels within the Operational Area.	Reputation – E If IMS were to establish on a vessel this could potentially impact the vessel operationally through the fouling of intakes, result in translocation of an IMS into the Operational Area and, depending on the species, potentially transfer of an IMS to other vessels, which would likely result in the quarantine of the vessel until eradication could occur (through cleaning and treatment of infected areas), which would be costly to perform. Such introduction would be expected to have minor impact to Woodside’s reputation, particularly with Woodside’s contractors, and would likely have a reputational impact on future proposals.	Remote (0) Interactions between vessels will be limited during the Petroleum Activities Program. There is also no direct contact (i.e. they are not tied up alongside) during these activities. Spread of marine pests via ballast water or spawning in these open ocean environments is also considered remote.
Transfer between vessels and to other marine environments beyond the Operational Area.	Not Credible This risk is considered so remote that it is not credible for the purposes of the Petroleum Activities Program. The transfer of a marine pest between vessels was considered remote, given the offshore open ocean environment (i.e. transfer pathway discussed above). For a marine pest to then establish into a mature spawning population on the vessel (which would have been through Woodside’s IMS process) and then transfer to another environment is not considered credible (i.e. beyond the Woodside risk matrix).		

Cumulative Impacts

Cumulative impacts are described in Section 8 of the Scarborough OPP (SA0006AF0000002, rev 5). No cumulative impacts have been identified as a result of the introduction of IMS.

Summary of Assessment Outcomes

Receptor	Impact	Receptor Sensitivity	Consequence	Likelihood	Risk Rating
Epifauna and infauna	Change in ecosystem dynamics	Low value habitat (homogenous)	Negligible (F)	Remote	Low
Industry, shipping and defence	Changes to the functions, interests or activities of other users	Medium value	Slight (E)	Remote	Low

Overall Risk Consequence: The overall risk consequence/risk rating for the introduction of IMS is Low based on a Slight consequence to the most sensitive receptors (other marine users). The risk consequence /risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP.

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
Legislation, Codes and Standards				
Project vessels including foreign vessels not party to the International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004 (BWM Convention) will manage their ballast water using one of the approved ballast water management options, as specified in the Australian Ballast Water Management Requirements. This applies to all project vessels that will enter the Operational Area, including those carrying out activities outside of Australian Territorial Seas (>12nm).	F: Yes. CS: Minimal cost. Standard practice.	Reduces the likelihood of transfer of marine pests between vessels within the Operational Area. No change in consequence would occur.	Controls based on legislative requirements under the <i>Biosecurity Act 2015</i> – must be adopted.	Yes C 15.1
Internationally sourced Project vessels will manage their biosecurity risk associated with biofouling as specified in the Australian Biofouling Management Requirements.	F: Yes. CS: Standard practice.	Reduces the likelihood of transfer of marine pests between vessels within the Operational Area. No change in consequence would occur.	Controls based on legislative requirements under the <i>Biosecurity Act 2015</i> – must be adopted.	Yes C 15.2
Good Practice				
Woodside's IMS risk assessment process will be applied to project vessels and immersible equipment that enter the Operational Area, unless exempt (Section 7.2.2). Based on the outcomes of each IMS risk assessment, management options commensurate with the risk will be implemented to minimise the likelihood of IMS being introduced.	F: Yes. CS: Minimal cost. Good practice implemented across all Woodside Operations.	Identifies potential risks and additional controls implemented accordingly. In doing so the likelihood of transfer of marine pests between project vessels and immersible equipment within the Operational Area is reduced. No change in consequence would occur.	Benefits outweigh cost/sacrifice.	Yes C 15.3
Professional Judgement – Eliminate				
No discharge of during the Petroleum Activities Program.	F: No. Ballast water discharges are critical for maintaining vessel stability. Given the nature of the Petroleum Activities Program, the use of ballast (including the potential discharge of ballast water) is considered to be a	Not assessed, control not feasible.	Not assessed, control not feasible.	No

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
	safety critical requirement. CS: Not assessed, control not feasible.			
Eliminate use of vessels.	F: No. Given that vessels must be used to implement the Petroleum Activities Project, there is no feasible means to eliminate the source of risk. CS: Loss of the project.	Not assessed, control not feasible.	Not assessed, control not feasible.	No
Professional Judgement – Substitute				
Source project vessels based in Australia only.	F: Potentially. Limiting activities to only use local vessels could potentially pose a significant risk in terms of time and duration of sourcing a vessel, as well as the ability of the local vessels to perform the required tasks. For example, there are limited TSHD vessels based in Australian waters. While the Petroleum Activities Program will attempt to source vessels locally it is not always possible. Availability cannot always be guaranteed when considered competing Oil and Gas activities in the region. In addition, sourcing Australian based vessels only will cause increases in cost due to pressures of vessel availability. CS: Significant cost and schedule impacts due to restrictions of vessel hire opportunities.	Sourcing vessels from within Australian will reduce the likelihood of IMS from outside Australian waters, however, it does not reduce the likelihood of introduction of species native to Australia but alien to the Operational Area and NWMR, or of IMS that have established elsewhere in Australia. The consequence is unchanged.	Disproportionate. Sourcing vessels from Australian waters may result in a reduction in the likelihood of IMS introduction to the Operational Area; however, the potential cost of implementing this control is grossly disproportionate to the minor environmental gain (or reducing an already remote likelihood of IMS introduction) potentially achieved by using only Australian based vessels, consequently this risk is considered not reasonably practicable.	No
IMS inspection of all project vessels.	F: Yes. Approach to inspect vessels could be a feasible option. CS: Significant cost and schedule impacts. In addition, Woodside's	Inspection of all vessels for IMS would reduce the likelihood of IMS being introduced to the Operational Area. However, this	Disproportionate. The cost/sacrifice outweighs the benefit gained, as other controls to be	No

Demonstration of ALARP				
Control Considered	Control Feasibility (F) and Cost/Sacrifice (CS)	Benefit in Impact/Risk Reduction	Proportionality	Control Adopted
	IMS risk assessment process is seen to be more cost effective as this control allows Woodside to manage the introduction of marine pests through biofouling, while targeting its efforts to areas of greatest concern.	reduction is unlikely to be significant given the other control measures implemented. No change in consequence would occur.	implement achieve an ALARP position.	
Professional Judgement – Engineered Solution				
No additional controls identified.				
ALARP Statement:				
On the basis of the environmental impact assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.3.3), Woodside considers the adopted controls appropriate to manage the risks and consequences of the introduction of IMS. As no reasonable additional/alternative controls were identified that would further reduce the risks and consequences without grossly disproportionate sacrifice, the risks and consequences are considered ALARP.				

Demonstration of Acceptability
Acceptability Criteria and Assessment
The Petroleum Activities Program meets the acceptability criteria (Section 2.3.5): <ul style="list-style-type: none"> • Overall risk consequence/risk ratings for individual receptors are consistent with the levels rated in the Scarborough OPP. • EPOs and controls in the Scarborough OPP that are relevant to an unplanned introduction of IMS have been adopted. • There are no changes to internal/external context specific to this risk from the Scarborough OPP, including issues raised during stakeholder consultation.
Acceptability Statement:
The impact assessment has determined that the accidental introduction and establishment of IMS represents a low current risk rating and is unlikely to result in a risk consequence greater than Minor. The adopted controls are considered consistent with industry legislation, codes and standards. Further opportunities to reduce the impacts have been investigated above. The potential risks and consequences are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the risks and consequences of an accidental introduction of IMS to a level that is broadly acceptable.

Environmental Performance Outcomes, Standards and Measurement Criteria			
EPO	Adopted Control(s)	EPS	MC
<p>EPO 6 Undertake the Petroleum Activities Program in a manner that will not modify, destroy, fragment, isolate or disturb an important or substantial area of habitat such that an adverse impact on marine ecosystem functioning or integrity results.</p> <p>EPO 26 Undertake the Petroleum Activities Program in a manner which prevents a known or potential pest species (IMS) becoming established.</p>	<p>C 15.1 Project vessels (including foreign vessels not party to the International Convention for the Control and Management of Ships' Ballast Water and Sediments 2004 (BWM Convention)) will manage their ballast water using one of the approved ballast water management options, as specified in the Australian Ballast Water Management Requirements. This applies to all project vessels that will enter the Operational Area, including those carrying out activities outside of Australian Territorial Seas (>12nm).</p>	<p>PS 15.1 Prevent the translocation of IMS within the vessel's ballast water from high risk locations to the Operational Area.</p>	<p>MC 15.1.1 Ballast Water Records System maintained by vessels which verifies compliance against Australian Ballast Water Management Requirements.</p>
	<p>C 15.2 Internationally sourced Project vessels will manage their biosecurity risk associated with biofouling as specified in the Australian Biofouling Management Requirements.</p>	<p>PS 15.2 Compliance with Australian Biofouling Management Requirements.</p>	<p>MC 15.2.1 Records of implementation of biofouling management measures and pre-arrival reporting</p>
	<p>C 15.3 Woodside's IMS risk assessment process will be applied to project vessels and immersible equipment that enter the Operational Area, unless exempt (Section 7.2.2). Based on the outcomes, management options commensurate with the risk will be implemented to minimise the likelihood of IMS being introduced.</p>	<p>PS 15.3.1 Before entering the Operational Area, project vessels and immersible equipment are determined to be low risk³⁹ of introducing IMS of concern.</p>	<p>MC 15.3.1 Records of IMS risk assessments maintained for all project vessels and immersible equipment entering the Operational Area to undertake the Petroleum Activities Program.</p>
		<p>PS 15.3.2 In accordance with Woodside's IMS risk assessment process, the IMS risk assessments will be undertaken by an authorised environment adviser who has completed relevant Woodside IMS training or by qualified and experienced IMS inspector.</p>	<p>MC 15.3.2 Records confirm that the IMS risk assessments undertaken by an Environment Adviser or IMS inspector (as relevant).</p>

³⁹ Low risk of introducing IMS of concern is defined as either no additional management measures required or, management measures have been applied to reduce the risk.

6.9 EPBC Act Assessment

6.9.1 Principles of ESD

For all impacts and risks assessed in Section 6 an assessment was conducted to determine if the Petroleum Activities Program was consistent with relevant principles of ESD, as described in Section 2.4.1.

This assessment determined that the activity is consistent with principles of ESD a), b), c) and d). Principle e) ('improved valuation, pricing and incentive mechanisms should be promoted') is not relevant to the activity.

6.9.2 MNES Significant Impact Guidelines

As part of the evaluation of potential impacts and risks from routine acoustic emissions (Section 6.7.6) an assessment was undertaken to determine if any relevant significant impact criteria for EPBC Act listed Endangered or Vulnerable species were met.

The activity will not result in any population level effects on any populations of listed Endangered or Vulnerable species, nor will it "modify, destroy, remove, isolate or decrease the availability or quality of habitat to the extent that the species is likely to decline". Therefore, the Petroleum Activities Program will not have a significant impact on any MNES.

6.9.3 Recovery Plan and Threat Abatement Plan Assessment

As described in Section 2.4, NOPSEMA will not accept an EP that is inconsistent with a recovery plan or threat abatement plan for a listed threatened species or ecological community. This section described the assessment the Woodside has taken to demonstrate that the Petroleum Activities Program is not inconsistent with any relevant recovery plans or threat abatement plans. For the purposes of this assessment the relevant Part 13 statutory instruments (recovery plans and threat abatement plans) are:

- Recovery Plan for Marine Turtles in Australia 2017 – 2027 (Commonwealth of Australia, 2017).
- Conservation Management Plan for the Blue Whale – a Recovery Plan in the Environment Protection and Biodiversity Conservation Act 1999, 2015 – 2025 (Commonwealth of Australia, 2015a).
- Recovery Plan for the Grey Nurse Shark (*Carcharias taurus*) 2014 (Commonwealth of Australia, 2014b).
- Sawfishes and River Sharks Multispecies Recovery Plan (Commonwealth of Australia, 2015c).
- Threat Abatement Plan for the impacts of marine debris on the vertebrate wildlife of Australia's coasts and oceans 2018 (Commonwealth of Australia, 2018).

Table 6-33 list the objectives and (where relevant) the action areas of these plans, and also describes whether these objectives/action areas are applicable to government, the Titleholder and/or the Petroleum Activities Program. For those objectives/action areas applicable to the Petroleum Activities Program, the relevant actions of each plan have been identified, and an evaluation has been conducted as to whether impacts and risks resulting from the activity are clearly inconsistent with that action or not. The results of this assessment against relevant actions are presented in Table 6-34 to Table 6-38.

Table 6-33: Identification of applicability of recovery plan and threat abatement plan objectives and action areas

EPBC Act Part 13 Statutory Instrument	Applicable to:		
	Government	Licence / Titleholder	Petroleum Activities Program
Marine Turtle Recovery Plan			
Long-term Recovery Objective: Minimise anthropogenic threats to allow for the conservation status of marine turtles to improve so they can be removed from the EPBC Act threatened species list	Y	Y	Y
Interim Recovery Objectives			
Current levels of legal and management protection for marine turtle species are maintained or improved, both domestically and throughout the migratory range of Australia’s marine turtles	Y		
The management of marine turtles is supported	Y		
Anthropogenic threats are demonstrably minimised	Y	Y	Y
Trends in nesting numbers at index beaches and population demographics at important foraging grounds are described	Y	Y	
Action Areas			
A. Assessing and addressing threats			
A1. Maintain and improve efficacy of legal and management protection	Y	Y	
A2. Adaptively manage turtle stocks to reduce risk and build resilience to climate change and variability	Y		
A3. Reduce the impacts of marine debris	Y	Y	Y
A4. Minimise chemical and terrestrial discharge	Y	Y	Y
A5. Address international take within and outside Australia’s jurisdiction	Y		
A6. Reduce impacts from terrestrial predation	Y		
A7. Reduce international and domestic fisheries bycatch	Y		
A8. Minimise light pollution	Y	Y	Y
A9. Address the impacts of coastal development/infrastructure and dredging and trawling	Y	Y	
A10. Maintain and improve sustainable Indigenous management of marine turtles	Y		
B. Enabling and measuring recovery			
B1. Determine trends in index beaches	Y	Y	Y
B2. Understand population demographics at key foraging grounds	Y		
B3. Address information gaps to better facilitate the recovery of marine turtle stocks	Y	Y	Y
Blue Whale Conservation Management Plan			
Long-term recovery objective: Minimise anthropogenic threats to allow for their conservation status to improve so that they can be removed from the EPBC Act threatened species list	Y	Y	Y
Interim Recovery Objectives			
The conservation status of blue whale populations is assessed using efficient and robust methodology	Y

6.9.4 Australian Marine Parks

The objectives of the North-west Marine Parks Management Plan are:

- a) The protection and conservation of biodiversity and other natural, cultural and heritage values of marine parks in the North-west Network; and
- b) Ecologically sustainable use and enjoyment of the natural resources within marine parks in the North-west Network, where this is consistent with objective (a)

The specific values of the marine parks have been provided in Appendix H and Table 4-21.

Table 6-39 list the values of the relevant marine parks and an evaluation has been conducted as to whether impacts and risks resulting from the activity are not inconsistent with the objectives of the North-west Marine Parks Management Plan

Table 6-39: Assessment against the designated values of the Montebello and Dampier Marine Park

AMP	Designated values*	Evaluation
Montebello Marine Park	Natural values	
	Ancient Coastline at 125m Depth Contour KEF	Refer to Section 6.7.3, 6.7.2, 6.8.2 and 6.8.6 Not inconsistent assessment: The assessment of impacts to the Ancient Coastline at 125 m Depth Contour KEF determined impacts are expected to be no more than slight and any potential disturbance will only occur in a small portion of the KEF (<0.0004 km ²) where the trunkline will intersect with the KEF. Therefore, the activities will allow for the protection and conservation of the ancient coastline at 125 m depth contour KEF within the marine park. Given the planned activities are consistent with the objectives of the Multiple Use Zone and do not infringe on the protection and conservation of the KEF, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Humpback whale migration BIA	Refer to Section 6.7.6, 6.8.2 and 6.8.7 Not inconsistent assessment: The assessment determined that the identified planned activities and associated magnitude of potential impacts to humpbacks would be limited to a slight, short term impact and not expected to have a substantial adverse effect on the population, or the seasonal migration of humpbacks. Given the planned activities are consistent with the objectives of the Multiple Use Zone and do not infringe on the protection and conservation humpback whales, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Wedge tailed shearwater breeding BIA	Refer to Section 6.7.4 and 6.8.2 Not inconsistent assessment: The assessment determined that the magnitude of a potential impact to Wedge-tailed shearwaters would be limited to a slight, short term impact and not expected to have a substantial adverse effect on the population, or affect the emergence of fledgling wedge-tailed shearwaters. Given the planned activities are consistent with the objectives of the Multiple Use Zone and do not infringe of the protection and conservation of wedge tailed shearwaters, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.

AMP	Designated values*	Evaluation
	Internesting, foraging, mating and nesting for marine turtle (Flatback and green turtles)	Refer to Sections 6.7.3, 6.7.4, 6.7.5, 6.7.6, 6.8.2 and 6.8.7 Not inconsistent assessment: The assessment determined that the magnitude of a potential impact to marine turtles would be limited to a slight, short term impact and not expected to have a substantial adverse effect on the population, or important life cycle stages of marine turtles such as hatchling emergence or internesting by adult females. Given the planned activities are consistent with the objectives of the Multiple Use Zone and do not infringe of the protection and conservation of marine turtles, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Whale shark foraging BIA	Refer to Sections 6.7.4, 6.7.6, 6.8.2 and 6.8.7 Not inconsistent assessment: The assessment determined that the magnitude of a potential impact to whale sharks as a temporary deviation on their migration route, which covers a wide area and is not spatially restricted. All predicted impacts would be limited to a slight, short term impact and not expected to have a substantial adverse effect on the population, or important behaviour such as foraging or migrating. Given the planned activities are consistent with the objectives of the Multiple Use Zone and do not infringe of the protection and conservation of whale sharks, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Diverse fish communities	Refer to Sections 6.7.5, 6.7.6 and 6.8.2 Not inconsistent assessment: The assessment determined potential impacts to fish would be limited to a magnitude of a slight, short term impact and not expected to have a substantial adverse effect on the population, or spatial distribution of fish. Given the planned activities are consistent with the objectives of the Multiple Use Zone and do not infringe of the protection and conservation of the fish communities, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Diverse benthic communities (including Trial rocks)	Refer to Section 6.7.3 (trunkline installation) Not inconsistent assessment: The assessment determined potential impacts to benthic communities would be limited to a magnitude of a slight, short term impact (represents 0.07% of the Montebello Marine Park, including the area intersecting the Ancient Coastline KEF) and will not modify a substantial area of habitat such that an adverse impact on marine ecosystem functioning or integrity results. Therefore, given the planned activities are consistent with the objectives of the Multiple Use Zone and do not infringe on the protection and conservation of benthic habitats, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
Heritage values		
	Two known shipwrecks – Trial and Tanami	Refer to Section 4.9.1.8 Trial and Tanami wrecks are more than 10 km from the Operational Area therefore there are no expected impacts to heritage values of the Marine Park
Cultural values		
	Table 4-21—described the cultural values of the marine park, noting that cultural values may be intrinsically linked to natural values identified above.	The evaluation of the potential impacts and risks from the Petroleum Activities Program to natural values as demonstrated above predicts only slight, short term impacts which do not infringe of the overall protection and conservation of the natural values of the Montebello Marine Park and are consistent with the objectives of the Multiple Use Zone. Therefore, cultural values of the Montebello marine park, which may be intrinsically linked to

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

AMP	Designated values*	Evaluation
		the natural values, will also be protected. The activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Social and economic values	
	Tourism, commercial fishing, mining and recreation	Refer Section 6.7.1 Not inconsistent assessment: Any displacement of tourism, commercial fishing, mining and recreation will be temporary with no lasting effect. Therefore, the planned activities are consistent with the objectives of the Multiple Use Zone and allow for the ecologically sustainable use and enjoyment of the natural resources in the marine park. Therefore, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Natural values	
	Diverse benthic communities (including sponge biodiversity)	Refer Sections 6.7.2 Not inconsistent assessment: The assessment determined that there are no predicted impacts to benthic communities within the AMP. Therefore, the activities will allow for the protection and conservation of the diverse benthic communities and the activity is not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Diverse fish communities	Refer to Section 6.8.2 Not inconsistent assessment: The assessment determined potential impacts to fish from a hydrocarbon release would be limited to a magnitude of a slight, short term impact and not expected to have a substantial adverse effect on the population, or spatial distribution of fish. In the highly unlikely event of a hydrocarbon spill, the activity does not infringe of the protection and conservation of the fish communities, therefore the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
Dampier Marine Park	Breeding and foraging BIA for shearwaters	Refer to Sections 6.7.4 and 6.8.2 Not inconsistent assessment: The assessment determined that the magnitude of a potential impact to shearwaters would be limited to a slight, short term impact and not expected to have a substantial adverse effect on the population, or spatial distribution of shearwaters. Given the activities do not infringe of the protection and conservation of wedge tailed shearwaters, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Humpback whale migration BIA	Refer to Section 6.7.6 and 6.8.7 Not inconsistent assessment: The assessment determined that the identified planned activities and associated magnitude of potential impacts to humpbacks would be limited to a slight, short term impact and not expected to have a substantial adverse effect on the population, or the seasonal migration of humpbacks. Given the activities do not infringe on the protection and conservation humpback whales, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Internesting habitat for marine turtles	Section 6.7.2, Section 6.7.4, Section 6.7.6 and 6.8.7 Not inconsistent assessment: The assessment determined that the magnitude of a potential impact to marine turtles would be limited to a slight, short term impact and not expected to have a substantial adverse effect on the population, or important life cycle stages of marine turtles such as hatchling emergence or internesting by adult females. Given the activities do not infringe of the protection and conservation of marine turtles, the activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

AMP	Designated values*	Evaluation
	Cultural value	
	Table 4-21—described the cultural values of the marine park, noting that cultural values may be intrinsically linked to natural values identified above.	Not inconsistent assessment: The evaluation of the potential impacts and risks from the Petroleum Activities Program to natural values as demonstrated above predicts only slight, short term impacts which do not infringe of the overall protection and conservation of the natural values of the Dampier Marine Park. Therefore, cultural values of the Dampier Marine Park, which may be intrinsically linked to the natural values, will also be protected. The activity is viewed as not inconsistent with the objectives of North-west Marine Parks Management Plan.
	Heritage values	
	No known heritage values known	N/A
	Social and economic values	
Port activities, commercial fishing and recreation	No activities will occur in the AMP therefore there are no expected impacts to the social and economic values of the marine park.	

6.10 Cultural Features and Heritage Values Assessment

As described in Section 4, the identification of cultural features and heritage values of the environment as well as the social, economic and cultural features important to First Nation’s people is integral to understanding the environment and any potential impacts and risks to the environment.

In line with Woodside’s First Nations Communities Policy (Woodside 2022), Woodside seeks to avoid damage or disturbance to cultural heritage (including intangible heritage) and, if avoidance is not possible, minimise and mitigate the impacts, in consultation with First Nation communities and Traditional Custodians. Mitigation can include any measure or control aimed at ensuring the viability of the intangible cultural heritage and its intergenerational transmission. This can include reducing impacts and risks to environmental features that are associated with intangible cultural heritage (UNESCO 2003; ICOMOS 2013).

It is important to note that not all topics raised by First Nations groups / individuals through consultation are considered values for the purpose of the cultural features and heritage values impact assessment below. A number of topics were raised in the context of a general interest in environmental management and ecosystem health (i.e., natural environment interest), where the group/individual was seeking further information about potential impacts and risks from the Petroleum Activities Program on a receptor. As these interests relate to the maintenance of the natural environment, these are adequately addressed through impact and risk assessments described in Sections 6.7 and 6.8 respectively and not further assessed below.

Aspect	Cultural Features and Heritage Values
Description of source impact/ risk (key aspects)	<p><i>Physical presence of vessels</i></p> <p>Several vessel types will be required to complete the activities associated with the Petroleum Activities Program (refer to Section 3.9.2). The physical presence and movement of project vessels within the Operational Area has the potential to displace other marine users.</p> <p>Vessel physical presence and movement closer to the Dampier Archipelago and the Pilbara Port Authority Management Area is limited to activities along the trunkline route, the cycling of dredging and backfill between the Offshore Borrow Ground Project Area and Trunkline Project Area, and disposal of material in Spoil Ground 5A. These activities will be conducted over a period of months, and vessels will be continually moving. PV will move at a rate of around 3km per day. Temporary exclusion zones will be established around operating vessels. Refer to Section 6.7.1 for more details.</p> <p><i>Light emission from vessels</i></p> <p>Project vessels will have external lighting to support safe operations at night, as well as to communicate the presence and activities of project vessels to other marine users (i.e. navigational lights). This lighting typically consists of bright white (i.e. metal halide, halogen, fluorescent) lights, and is not dissimilar to lighting used for other offshore activities, including fishing and shipping. Lighting is required for the safe operation of the project vessels and cannot reasonably be eliminated.</p> <p>Project vessel light emissions in any one area will be limited by the transient nature of the works along the trunkline route and the cycling of dredging and backfill between the Offshore Borrow Ground Project Area, Trunkline Project Area and disposal of material in Spoil Ground 5A. Refer to Section 6.7.4 for more details.</p> <p><i>Acoustic emissions from vessels</i></p> <p>There are various sources of underwater acoustic emissions during the Petroleum Activities Program including survey activities, underwater positioning equipment, helicopter operations, seabed disturbance (i.e. rock placement and seabed trenching); however the most significant noise emitter will be vessel operations themselves.</p> <p>The sound levels and frequencies generated by vessels varies with the size of the vessel, speed, engine type and the activity being undertaken. Large vessels typically produce higher sound levels at lower frequencies than small vessels, although significant variation may be found among vessels within the same group. Sound levels tend to be greatest when engaging the throttle or</p>

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

thrusters, such as use of DP or when vessels are operating under load, compared with slow moving or idling vessels.

The greatest sound levels are likely to be associated with vessels using DP thrusters to maintain position on station. For example, the deepwater PV, TSHD and OCV will operate on DP and support and supply vessels may also engage thrusters when working alongside. Refer to **Section 6.7.6** for more details.

Seabed disturbance

- Trunkline trenching and spoil disposal: will occur within the Trunkline Project Area and may result in seabed disturbance between the State Waters boundary (approximately KP 32) to a maximum of KP39 (including Spoil Ground 5A). Trenching out to KP50 is considered a contingency only that has been impact and risk assessed under the EP. Trenching works involves dredging a trench about 2 to 3.5 m deep within the indicative trunkline disturbance corridor (~30 m width). Sediment will be placed within Spoil Ground 5A, which is a previously disturbed spoil ground. Expected disturbance area is 0.24 km² for trenching and backfill, and 1.6 km² for spoil disposal.
- Offshore borrow ground dredging and Trunkline backfill: After the installation of the trunkline in the trench, backfilling with dredged material from the Offshore Borrow Ground will be required to help stabilise the trunkline. Backfill material will be dredged and placed using a TSHD. Dredging within the offshore borrow ground is expected to result in a seabed disturbance area of around 4 km² (with maximum allowable disturbance area of 17 km² based on the entire borrow ground being disturbed, which is not anticipated).
- Trunkline installation: The Trunkline is dual diameter, with the diameter between the State Waters boundary and ~KP200 being nominal 36" and the remainder of the Trunkline to the FPU being nominal 32" diameter. From the shore to around ~KP160, the Trunkline will be routed alongside the existing Pluto gas trunkline (about 100 m to the south). The PV will install the pipeline end termination (PLET) at the end of the Trunkline and position it on top of pre-installed foundations. Expected disturbance area for the trunkline and ancillary structures is around 2.07 km².
- Pipeline and infrastructure crossings: the Trunkline route crosses existing subsea infrastructure including pipelines, flexible flowlines, umbilicals and fibre optic cables, which will require the installation of crossing supports using rock or concrete mattresses. Three crossings lie within the Montebello AMP Multi Use Zone. Expected disturbance area from pipeline and infrastructure crossings is around 0.06 km².
- Continental Slope Crossing Seabed Preparation: At about KP 209 of the Trunkline route, seabed material will be excavated and/or displaced over a length of approximately 150 m within a 300 m corridor (excluding placement of excavated material), which will allow appropriate pipeline span lengths. Expected disturbance area from continental slope crossing seabed preparation is about 0.10 km².

Refer to Section 6.7.3 for more details.

Unplanned hydrocarbon release from vessel (basis of EMBA)

The temporary presence of the project vessels in the Operational Area may result in a navigational hazard for commercial shipping within the immediate area. This navigational hazard could result in a third-party vessel colliding with the project vessels which could result in a loss of containment. Project vessels typically have multiple isolated tanks and the largest volume of a single tank for these types of vessels is in the order of 250 m³ (for survey vessels, support vessels and pipe transport vessels) to 2000 m³ (for a refuelling vessel).

The EMBA is the largest spatial extent where unplanned events could have an environmental consequence on the surrounding environment. For this EP, the EMBA is the potential spatial extent of surface and in-water hydrocarbons at concentrations above ecological impact thresholds, in the highly unlikely event of the worst-case credible spill (2,000 m³) modelled at three key locations. The EMBA therefore covers a larger area than the area that would be affected during any one single spill event. In the event of a spill the EMBA would be much smaller and is intermittent e.g., plume travels away from the release location based on prevailing currents and winds directions.

The EMBA is driven by the distribution of entrained hydrocarbon above ecological thresholds and hence although Islands such as Barrow and Montebello Islands are within the EMBA, these are not expected to be affected unless there is shoreline contact above thresholds. Shoreline contact

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

was only predicted at the outer Islands of the Dampier Archipelago (namely Lady Nora Island, Brigadier Island, Legendre Island and Cohen Island) and Barrow Island. Noting that the maximum local accumulated concentration on shorelines is 156 g/m² forecast at Dampier Archipelago and contact at Barrow Island is below the ecological threshold of 100 g/m². Refer to Section 6.8.2 for more details.

Receptor sensitivity

Cultural features and heritage values: High value

Marine mammals: High value species

Marine reptiles: High value species

Fish: High value species

Seabirds: High value species

Coral: High value habitat

Seagrass: High value habitat

Mangroves: High value habitat

Planned Activity Aspect

The potential environmental impact from the Petroleum Activities Program to species that have a cultural feature or heritage value have been summarised below to provide the context related cumulative impact on the cultural feature or heritage value.

Impact Significance Level

Environmental impact assessment to marine species	Marine mammals	Marine reptiles	Fish	Seabirds	Coral	Seagrass	Mangroves
6.7.2 Physical Presence – Seabed Disturbance (trenching, spoil disposal, borrow ground dredging and Trunkline backfill)	N/A	Minor (D)	Slight (E)	N/A	Slight (E)	N/A	N/A
6.7.3 Physical Presence – Seabed Disturbance (Intervention and Trunkline Installation)	N/A	Minor (D)	N/A	N/A	N/A	N/A	N/A
6.7.4 Routine Light Emissions from Project Vessels	N/A	Slight (E)	N/A	Slight (E)	N/A	N/A	N/A
6.7.6 Routine Acoustic Emissions	Slight (E)	Slight (E)	Slight (E)	N/A	N/A	N/A	N/A
6.7.7 Routine and Non-Routine Discharges – Vessels and Seabed Intervention	Slight (E)	Slight (E)	Slight (E)	N/A	N/A	N/A	N/A
6.7.8 Routine and Non-Routine Discharges – Trunkline Installation and Pre-commissioning	Slight (E)	Slight (E)	Slight (E)	N/A	N/A	N/A	N/A

Unplanned Activity Aspect

The potential environmental risk from the Petroleum Activities Program to species that have a cultural feature or heritage value have been summarised below to provide the context related cumulative risk on the cultural feature or heritage value.

		Risk Rating						
Environmental risk assessment to marine species		Marine mammals	Marine reptiles	Fish	Seabirds	Coral	Seagrass	Mangroves
6.8.2	Unplanned Hydrocarbon Release – Vessel Collision	Moderate	Moderate	Moderate	Moderate	Moderate	Low	Low
6.8.3	Unplanned Hydrocarbon Release – Bunkering	Low	Low	Low	N/A	N/A	N/A	N/A
6.8.4	Unplanned Discharge – Deck and Subsea Spills	Low	Low	Low	Low	N/A	N/A	N/A
6.8.5	Unplanned Discharge – Hazardous and Non-Hazardous Solid Waste / Equipment	Low	Low	Low	Low	N/A	N/A	N/A
6.8.7	Physical Presence (Unplanned) – Interaction with Marine Fauna	Low	Low	Low	N/A	N/A	N/A	N/A

Impact and Risk Assessment

The Petroleum Activities Program has the potential impact cultural features and heritage values through the following ways:

Archaeological heritage:

- Places that are identified in the literature for their value as archaeological sites can be assumed to be impacted where there is an impact to the archaeological or scientific values of its tangible elements. This could include damage or disturbance of archaeological material or to the archaeological context.

Intangible cultural heritage:

- Songlines: Songlines can become lost, fragmented, or broken when there is a loss of Country or forced removal from Country (Neale and Kelly 2020:30). Physical sites that have been identified as comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. It is noted that oil and gas infrastructure exists in many areas of the North West Shelf, and that songlines are still acknowledged and recognised. It is inferred that if there were to be any impacts to surviving songlines these would be significantly more likely to be described as qualitative (i.e. “weaken” a songline) rather than binary or absolute (i.e. destroy a songline).
- Creation/dreaming sites; sacred sites; ancestral beings: Activities that physically alter landscape features may be assumed to potentially impact values of creation/dreaming sites, sacred sites or ancestral beings.
- Ceremonial sites: Activities that prevent the performance of ceremony at these sites will directly impact its values.
- Cultural obligations to care for Country: Environmental impacts may be assumed to impact rights and obligations to care for Sea Country. Exclusion of Traditional Custodians from Sea Country (e.g., by restricting access) or decision-making processes (e.g., by not conducting ongoing consultation) are other potential sources of impact.
- Knowledge of Country/customary law and transfer of knowledge: Direct impact to communities practicing these skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in population. Therefore, the transmission of these skills is expected to be impacted where there are impacts at the species/population

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

level. Limitations on access to sites or disruption/relocation of First Nations communities may have implications for the preservation of First Nations knowledge.

- Connection to Country: Where people are displaced or disrupted (e.g., during colonisation) or where there is a loss of technical skills or environmental knowledge this may damage connection to Country (McDonald and Phillips, 2021).
- Access to Country: Impacts to access to Country may be classified as temporary (e.g. where exclusion zones exist around activities for safety reasons) or permanent (e.g. where infrastructure obstructs access or navigation). Impacts to access to Country can only occur in areas that were traditionally accessed by Traditional Custodians. As described in Section 4.9.1.3 this is anticipated to be focussed on areas adjacent to the coast.
- Kinship systems and totemic species: It is assumed that marine species may have kinship/totemic relationships to Traditional Custodians, but it is understood that these relationships do not prohibit people outside of that “skin group” from hunting or eating that same species (Juluwarlu 2004). It is therefore inferred that the management of totemic or kinship species applies at the species/population level and not to individual plants and animals.
- Resource collection: Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, marine species (as resources) will be impacted where there is an impact at the species/population level.

Marine ecosystems and species:

- Marine ecosystems may hold both cultural and environmental value (see Section 4.9.1), with cultural and environmental values intrinsically linked (DCCEEW 2023, MAC 2021 as cited in Woodside 2023a). It necessarily follows that an impact to marine ecosystems has the potential to impact cultural features where the impact is detectable within sea country—the seascape which Traditional Custodians view, interact with or hold knowledge of.

Archaeological Heritage

Onshore / intertidal archaeological sites

No coastal areas or islands exist within the Operational Area. A review of the of DPLH’s Aboriginal Heritage Inquiry System identified 54 Registered Aboriginal Sites and 40 Other Heritage Places in the EMBA. These were mainly comprised of sites at Barrow Island, Dampier Archipelago and the Ningaloo coast. These locations do exist within the EMBA boundary, however given the EMBA is driven by an unplanned marine diesel spill there is no anticipated impact pathway from this activity to onshore archaeological sites above highest astronomical tide (HAT).

Archaeological sites may exist in intertidal landscapes within the EMBA and may be exposed to marine diesel from an unplanned spill, however there is no anticipated impact pathway from the presence of marine diesel on archaeological values, as this is not expected to impact the fabric or context of sites on an exposed shoreline site. Impacts to the heritage value of fish traps from marine diesel in an unplanned spill may occur indirectly through impacts to fish. However, it is expected that continued use of fish traps beyond their archaeological value will be preserved where fish species and distribution are maintained at a population level. With regard to fish, refer to species specific assessment below for further information, in addition to the impact and risk assessment in Sections 6.7 and 6.8 respectively.

Submerged archaeological sites

No archaeological sites have been identified beyond terrestrial or intertidal areas, with the exception of two sites at Murujuga in Cape Bruguieres channel and Flying Foam Passage (Benjamin et al. 2020; Benjamin et al 2023), which are outside of the EMBA. Nevertheless, there is the potential for submerged archaeological sites on the Ancient Landscape. Assessments of the Operational Area, detailed in Section 4.9.1, have not identified any archaeological sites on the Ancient Landscape. Additionally, volcanic rock which may contain petroglyphs do not occur within the Operational Area. There is the potential (albeit low risk) that submerged archaeological sites may exist in unassessed areas of the Offshore Borrow Ground, and as such additional controls have been adopted to mitigate the risk of disturbance to unidentified UCH.

Submerged archaeological sites (locations undefined) may exist on the Ancient Landscape within the broader EMBA. However, given the EMBA is driven by an unplanned marine diesel spill, it is not expected to impact the seabed or archaeological material on or within it. Therefore, there is no anticipated impact pathway to submerged archaeological sites in the broader EMBA from the Petroleum Activities Program.

Rivers, waterholes, tidal channels and seeps

Assessments detailed in Section 4.9.1.5.2 have not identified any active or former freshwater sources within the Operational Area. There are no known significant freshwater systems within the EMBA. Oceanographic studies indicate that both the open ocean and coastal zone off Western Australia are well-mixed and saline. Submerged former water sources (e.g. river beds) may exist within the EMBA which are archaeologically prospective or culturally significant.

It has been asserted that locations where saltwater and freshwater meet “are where the biggest energy lines are”. Energy lines are understood by Woodside to be the same as songlines which are addressed below. The EMBA is driven by an unplanned marine diesel spill, which is not expected to impact the seabed or features on it. As such, there is no anticipated impact pathway from this activity to submerged water sources in the broader EMBA. In the highly unlikely and unmitigated worst case, unplanned marine diesel release may contact shorelines and receptors such as mangroves, and shoreline habitats. These habitats may contain brackish or fresh water due to runoff from land. Given hydrocarbon characteristics, rapid weathering, the low predicted volume ashore (3 m³), an unplanned release is expected to have no lasting effect on any freshwater sources along the shoreline.

Submerged calcarenite ridges/paleo beach barrier systems

Calcarenite ridges have been identified within the Operational Area, as detailed in Section 4.5.2. These features on the “mid shelf” identified in UWA (2021) are considered to predate human occupation of the Australian continent and therefore are not expected to contain archaeological material within it. Features on the “outer shelf” may contain archaeological material, but it was determined that “landforms and features that were identified on the seabed as having a higher probability of hosting indigenous UCH [underwater cultural heritage] ... have not been identified within the proposed pipeline route.” There is also no planned dredging or large-scale seabed disturbance of calcarenite features that may expose archaeological material within the Operational Area. Further there is no anticipated impact pathway to calcarenite ridges in the broader EMBA from the Petroleum Activities Program.

Submerged hills

Assessments detailed in Section 4.9.1 have not identified submerged hills within the Operational Area, however submerged hills have been identified in the broader EMBA. These features on the “mid shelf” identified in UWA (2021) may be archaeologically prospective or culturally significant. The EMBA is driven by an unplanned marine diesel spill, which is not expected to impact the seabed or features on it. There is no anticipated impact pathway to submerged hills in the broader EMBA from the Petroleum Activities Program.

Madeleine Shoals

Madeleine Shoals is a potentially archaeologically prospective location found outside the Operational Area. There are no planned activities that would result in direct seabed disturbance and while the Zone of Influence (Zol) from borrow ground dredging activity extends beyond the Operational Area there is no overlap with the seaward slopes around Madeleine Shoals. Further, the Zol represents a change in water quality but no impacts to benthic communities and habitats. As such, there is no anticipated impact pathway from this activity to archaeological features from changes in water quality.

While Madeleine Shoals is within the EMBA, this is driven by an unplanned marine diesel spill, and as such is not expected to impact the seabed or archaeological features on it. Therefore, there is no anticipated impact pathway to potentially archaeologically prospective sites at Madeleine Shoals from the Petroleum Activities Program.

Karst depressions/ravines and valleys between submerged ridges

Assessments detailed in Section 4.9.1 have not identified Karst depressions or other “catch points” within the Operational Area. Catch points have the potential to contain artefacts displaced by erosion during inundation which may be impacted by seabed disturbance. No planned seabed disturbance will occur outside the Operational Area.

General Intangible values

Songlines

Management of intangible cultural heritage can include reducing impacts and risks to environmental features that are associated with intangible cultural heritage (UNESCO 2003; ICOMOS 2013). Impacts to marine plants, animals and other cultural features associated with songlines might impact the intergenerational transmission of knowledge of songlines when individuals can no longer witness or interact with the cultural features tied to songlines on Country. Therefore, managing songlines may require environmental controls protecting species at a population level, including migratory routes. Refer to species specific assessment below for further information, in addition to the impact and risk assessment in Section 6.7 and 6.8 respectively.

Physical features comprising a component of a songline are important to protect to prevent the fragmenting or breaking apart of songlines and loss of sacred cultural knowledge. Songlines can become lost, fragmented, or broken when there is a loss of Country or impact to culturally important physical features (Neale and Kelly 2020:30). No specific details of songlines within the EMBA have been provided by relevant persons during consultation for this Activity, and no landforms typical of songlines (e.g. mountains, rivers, caves and hills (Higgins 2021)) are anticipated to be impacted by the Activity.

In publicly available literature, Murujuga is acknowledged as a starting point for songlines, including the flying fox songline (MAC 2023a). Precise location of this songline, and features of this songline that might be impacted, are not clearly articulated in the reviewed sources, but it is stated that “the sea is a source of creation for flying foxes” (DEC 2013). Although this does not provide the specificity required to determine the location of the flying fox songline or associated sites, Murujuga is located outside of the EMBA. Ethnographic survey (Section 4.9.1.5.2) also noted that “Dreamtime narratives... that commence at Murujuga and may also arrive from the sea including the... Bat (Flying Fox)” (McDonald and Phillips 2021). The ethnographic survey did not identify any sites within the EMBA related to songlines or make recommendations that any mitigations were required to manage songlines. Consultation with MAC and other Traditional custodians has not identified the flying fox songline as overlapping the EMBA, and flying foxes do not occur within the EMBA.

An ethnographic survey also noted “Dreamtime narratives... that commence at Murujuga and may also arrive from the sea including the *Marlu* (Plains Kangaroo)” (McDonald and Phillips 2021). Kearney et al (2023) notes a connection between the Kangaroo songline and a pair of submerged waterholes identified through seabed mapping by the Deep History of Sea Country project, which later found submerged artefacts in Flying Foam passage. Assessments detailed in Section 4.9.1.5.2 have not identified any active or former freshwater sources within the Operational Area that may connect to the Kangaroo or other songlines. Other terrestrial species with narratives originating or potentially originating from the sea at Murujuga noted by McDonald and Phillips (2021) include *Tarnguna* (Emu) and *Jugurru* (Dingo). The ethnographic survey did not identify any sites within the EMBA related to any songlines, or make recommendations that any mitigations were required to manage songlines. Consultation with MAC and other Traditional custodians has not identified these songlines as overlapping the EMBA, and these species do not occur within the EMBA.

In publicly available literature, Murujuga is acknowledged as the starting point for the seven sisters songline (Bainger 2021). Precise location of this songline, and features of this songline that might be impacted, are not clearly articulated in the reviewed sources, however Murujuga is located outside of the EMBA. Ethnographic survey (Section 4.9.1.5.2) also noted that “a number of Dreamtime narratives... extend from the waters around Murujuga on to country, including the KurriKurri (Seven Sisters)” (McDonald and Phillips 2021). The seven sisters story is associated with Whitnell [sic] Bay, Murujuga, Depuch Island and Port Hedland, all being outside of the EMBA (McDonald and Phillips 2021). The ethnographic survey did not identify any sites within the EMBA related to songlines or make recommendations that any mitigations were required to manage songlines. Consultation with MAC and other Traditional custodians has not identified the seven sisters songline as overlapping the EMBA.

The existence of a whale songline potentially intersecting the EMBA has also been asserted by members of Save Our Songlines. Consultation with this group and associated individuals has not provided detail on the presence, features or route of this songline. It is assumed (from information provided by this group) that whales as an environmental receptor are a feature of this songline; the environmental impacts and risk on whales are assessed in Sections 6.7 and 6.8. The most detailed description available to Woodside is asserted in the Concise Statement and Affidavit filed by ██████████ in the context of Scarborough seismic activities. Specifically, “whales carry important songlines, the whale dreaming, and connection between land and sea.” Specific details regarding the whale dreaming story are provided in Table 4-26. In summary, the whale dreaming story relates to transmission of knowledge and connection between environment and people, the women’s lore and connection to whales through their heart centre and obligation to care for country. It is stated that “because each animal uses songlines for migration, breeding and feeding, the disruption or distortion to the songlines causes the animals to become disoriented, confused or lost.” Further, that the whale’s songline creates a path for other fauna to follow.

It is therefore expected that the whale songline has the potential to be affected by the Petroleum Activities Program where there are impacts to whales at a population level, including disruption of migration routes, permanent displacement of whales and population decline, that result in discontinuation of story/transmission of knowledge, interruption of caring for Country activities, interruption of whale caretaker/midwife behaviour and interruption to performance of song/ceremony onshore. Given potential impacts to whales are limited to behavioural disturbance to transient individuals, which are not considered to be ecologically significant at a population level, the whale songline and associated whale dreaming story is not anticipated to be affected by the Petroleum

Activities Program. Note further assessment of intangible values and marine mammals are provided below, in addition to the impact and risk assessment in Section 6.6 and 6.7 respectively..

Creation/dreaming sites; sacred sites; ancestral beings

Woodside has undertaken all reasonable steps to identify creation and dreaming sites, and places associated with ancestral beings within the EMBA. No such sites have been identified. A review of relevant literature has been undertaken which has identified creation, dreaming and ancestral narratives related to the sea more broadly without confirming where (if anywhere) these overlap the EMBA. These references are of a general nature, and do not identify any features or values requiring specific protection or management from the proposed activities.

Sea serpents or water serpents are common in Aboriginal creation narratives, and several references were identified in the reviewed literature. The majority of these refer to serpents residing within inland rivers or pools outside of the EMBA (Barber and Jackson 2011, Dury v Western Australia [2018] FCA 1849, Hayes v Western Australia [2008] FCA 1487, Juluwarlu 2004, Kalbarri Visitor Centre 2023, Water Corporation 2019). In some versions, the serpent originates from the sea or coast and creates the rivers as it heads inland. Barber and Jackson (2011) also recount a story where a freshwater serpent pushes a sea serpent back into the ocean where it presumably continues to reside. This does not provide the specificity required to determine the location of sea serpents within the sea, and it is possible that the ocean as a whole (out to and beyond other continents) should be viewed generally as housing the sea serpent(s). Consultation with Traditional Custodians and ethnographic surveys have not identified activities of this Petroleum Activities Program as having an impact on sea serpents. However, by analogy to other water serpent narratives across Australia, possible impact pathways may include interruption of its path by blocking or reducing flows of water, damaging sacred sites such as thalu or rock art sites or depleting water sources.

No impacts to water flows (either tidal movement or ocean currents) or depletion of water sources are anticipated from this Petroleum Activities Program. Features of the landscape with the potential for connection to creation/dreaming stories and ancestral beings were noted within the EMBA—notably nearshore submerged waterways and hills in the “mid shelf” identified by UWA (2021). However, there are no anticipated impact pathways to submerged landscape features within the broader EMBA from the Petroleum Activities Program.

Ceremonial sites

All mentions of active ceremonial sites were confined to onshore locations and no direct impacts to onshore ceremonial sites are anticipated from the Petroleum Activities Program. However, indirect impacts may occur where ceremonies cannot be performed due to limitations on access, loss of knowledge or impacts to the environment, which are further described below.

Cultural obligations to care for Country

Caring for Country collectively refers to the cultural obligations of individuals and groups, as well as rituals and ceremonies required for the physical and spiritual health of the environment. Lack of access to coastally located cultural sites that carry songlines or remain ceremonially important can impact First Nations people’s livelihoods and impact their ability to carry out cultural obligations on Country. While there is potential for shoreline accumulation of hydrocarbons within the EMBA, relevant cultural authorities will be engaged in the event of a spill that may affect them, as specified in Appendix D.

Knowledge of Country/ customary law and transfer of knowledge

Cultural knowledge about Sea Country/customary law and the intergenerational transmission of knowledge are important values identified through consultation, assessments and the literature review.

Transfer of knowledge includes continuing traditional practices to pass on practical skills. No traditional practices conducted within the EMBA have been identified.

Direct impact to communities practicing these skills will inherently occur when relevant aspects of the environment disappear, are displaced or suffer a reduction in population—for example traditional fishing methods require the survival of traditional fish resources. Therefore, ensuring the transmission of cultural knowledge may require environmental controls protecting species and migratory pathways at a population level. Refer to species specific assessment below for further information, in addition to the impact and risk assessment in Section 6.6 and 6.7 respectively.

Connection to Country

Connection to Country describes the multi-faceted relationship between First Nations people and the landscape, which is envisioned as having personhood and spirit. Connection to Country may be damaged where people are displaced or disrupted (e.g. during colonisation) or where there is a loss of technical skills or environmental knowledge (McDonald and Phillips, 2021). No impacts of this nature are considered to arise from this Petroleum Activities Program. Access to Country is discussed below.

Access to Country

Access to Country, including Sea Country, is necessary for the continuation of other values including caring for Country and the transfer of traditional knowledge. Access is also a value in its own right, as a continuation of traditional Sea Country access and use.

Access to areas within the Operational Area may be limited where exclusion zones are established around vessels for safety purposes. Exclusion zones around seabed intervention and trunkline installation activities are temporary, and the presence of subsea infrastructure are not anticipated to affect navigation, particularly given the water depth within the Operational Area. Access to country within the EMBA would be limited to temporary exclusion in areas where there are hydrocarbons present, including shoreline accumulation. However relevant cultural authorities will be engaged in the event of a spill that may affect them, as specified in Appendix D.

Kinship systems and totemic species

Individuals may have kinship to specific species (Smyth 2008, Juluwarlu 2004) and/or a responsibility to care for species (Muller 2008). These relationships are understood to impose obligations on Traditional Custodians. It is understood that these obligations do not impose restrictions on other people generally, but it is considered that impacts to species at a population level may inhibit Traditional Custodians with kinship relationships' ability to perform their obligations where this results in reduced or displaced populations. It is therefore considered that the management of totemic or kinship species applies at the species/population level and not to individual plants and animals. As such, impacts to individual marine fauna is not expected to impact on the totemic or kinship cultural connection.

Totemic species identified during consultation include whales, fish, stingrays and octopuses. Refer to species specific assessment below for further information, in addition to the impact and risk assessment in Sections 6.7 and 6.8 respectively. In the highly unlikely event of a marine diesel spill relevant cultural authorities will be engaged in the event of a spill that may affect them, as specified in Appendix D.

Resource collection

A suite of marine species have been identified through consultation and literature as important resources, particularly as food sources. For example, Sea Country resources of noted relevance to Thalanyji people which may be present in the vicinity of the Montebello Islands include dugongs, majun (marine turtles), turtle eggs, fish and shellfish. Other resource species include marine mammals, fish, shellfish, crustaceans, seabirds, gastropods, sea urchins and mangrove seeds.

In addition to their immediate value as sustenance, the gathering and preparation of these resources are informed by cultural knowledge, and an inability to use these resources may result in a loss of ability to transfer that knowledge to future generations. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these communities may be impacted where there is an impact at the species/population level.

As assessed in Section 6.7, impacts from planned activities on the marine environment, including resources important to First Nations people, is expected to be limited to negligible or slight and therefore impacts that result in population effects (e.g., population decline, changes in migration routes, etc) are not expected. Impacts to potential resources within the EMBA, in the highly unlikely event of marine diesel spill, are described and risk assessed in Section 6.8.2 and are not expected to result in species / population level impacts. There may be potential impacts to resource collection along the coastlines where there is shoreline accumulation of marine diesel. Given hydrocarbon characteristics, rapid weathering, the low predicted volume ashore (3 m³), an unplanned release is not expected to have a substantial adverse impact resulting in population level changes. Therefore, impacts to resource collection would be limited to temporary exclusion in areas where there are hydrocarbons present, including shoreline accumulation. Further relevant cultural authorities will be engaged in the event of a spill that may affect them, as specified in Appendix D.

Marine Species

Marine mammals (whale, dolphins, dugongs)

There are increase ceremonies / rituals for species of animals and plants important to First Nations, to enhance or maintain populations. Thalu are places where these increase ceremonies are performed. All mentions of active ceremonial sites in the reviewed literature were confined to onshore locations, though the values may extend offshore where, for example, the thalu relates to marine species populations. As thalu ceremonies are performed to maintain and increase populations of marine species, it is inferred that management applies at the species/population level and not to individuals—for example the thalu site on Murujuga which “brings in whales to beach” will continue to serve its purpose so long as whales continue to migrate through Mermaid Sound. Reviewed literature (DBCA 2020) also includes information that is marked as information that cannot be copied, reproduced or

used without consent. The values described in the literature are environmental in nature, apply to marine mammal behaviours at a population level and are managed through existing environmental controls in Sections 6.7 and 6.8.

Related intangible cultural heritage may include the transmission of cultural knowledge about whales and whale behaviour, including birthing areas, whale communication and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Whale symbology expressed through stories, music, and dance can reflect a group's connections with the sea, as well as marine fauna, which then comprise a group's cultural values (Ardler 2021; Bursill et al. 2007; Cressey 1998). Whales also speak to a broader connection that exists between First Nation people and their surrounding environment. Beyond mythology and symbolism, whales can be connected with various economic and social functions associated with everyday life. Cultural knowledge of whales, whale migration, behaviour and the related marine environment may all be important in ensuring the continuation of these socio-economic functions and other related activities that remain valuable to First Nations people (Fijn 2021). No impacts to communities' ability to perform or transmit stories, music or dance are anticipated from the Petroleum Activities Program. Where timing or performance is linked to sighting or engaging with these species, impacts may occur where numbers or migration behaviours are impacted at a population level.

First Nations groups have expressed interest about whale migratory routes and studies. Inter-generational transmission of cultural knowledge (including songlines) relating to marine mammals may be impacted where changes to population or behaviour at a population level results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described in the relevant environmental impact and risk assessments in Sections 6.7 and 6.8 respectively, potential impacts to cetaceans from planned activities are limited to behavioural impact, which may include temporary and localised deviations from migratory pathways for cetaceans. However, no permanent impacts preventing cetaceans from entering or occupying the areas have been identified. These impacts and risks are not considered to be ecologically significant at a population level, and hence are not expected to impact the value of marine mammals, including the transmission of cultural knowledge. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

Marine reptiles (turtles, sea snakes)

Turtles and their eggs have been identified through consultation and existing literature as an important resource, particularly as food sources. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) will be impacted where there is an impact at the species/population level.

Intangible cultural heritage may also include the transmission of cultural knowledge about marine reptiles, such as nesting areas, hunting areas and migratory patterns. Cultural knowledge may also be conveyed through stories, such as the turtle being trapped in the sea as a result of its greed for berries as recounted by Capewell (2020). Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). First Nations groups have expressed an interest regarding turtle monitoring programs and migration patterns. Activities that impact turtle populations and their marine environment may have an indirect impact on some Aboriginal communities as this can limit access to cultural sites or deplete hunting areas that would threaten local food security (Delisle et al. 2018:251). Inter-generational transmission of cultural knowledge (including songlines) relating to marine reptiles may be impacted where changes to population or behaviour results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described in the relevant environmental impact and risk assessments in Sections 6.7 and 6.8 respectively, potential impacts to marine reptiles are likely to be restricted to temporary behavioural changes, which are not considered to be ecologically significant at a population level, and hence not expected to impact the value of marine reptiles, including the transmission of cultural knowledge or use as a resource. Further, impacts to turtle foraging habitat from dredging activities in Commonwealth waters will be limited to direct removal of sparse epifauna habitat, as modelling of the suspended sediment plumes from dredging is predicted to cause a detectable change to water quality with no impact to benthic communities and habitats. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

Fish and Cephalopods

Fish and squid have been identified through consultation and existing literature as an important resource, particularly as food sources. Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore these species (as resources) will be impacted where there is an impact at the species/population level.

Through consultation, fish were identified as important agents in the management of the broader ecosystem. It may be assumed that inter-generational transmission of cultural knowledge relating to fish may be impacted where changes to population or behaviour results in reduced sightings (e.g. through population decline). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003). Intangible cultural heritage associated with fish, including inter-generational knowledge regarding fishing techniques and migratory patterns, can be managed by reducing impacts to fish in nearshore marine environments to which this cultural knowledge is intrinsically connected.

The octopus is an important totem to Ngarla People and features in the creation story of Solitary Island. There are increase ceremonies / rituals for species of squid and octopus to enhance or maintain populations. Thalu are places where these increase ceremonies are performed. All mentions of active ceremonial sites in the reviewed literature were confined to onshore locations, though the values may extend offshore where, for example, the thalu relates to marine species populations. As thalu ceremonies are performed to maintain and increase populations of marine species, it is inferred that management applies at the species/population level and not to individuals.

As described in the relevant environmental impact and risk assessments in Sections 6.7 and 6.8 respectively, the potential impacts from the Petroleum Activities Program on fish⁴² are considered to be localised and with slight, short-term (<1-year) impact potential on species (or lower), but not affecting ecosystem function, physical or biological attributes. Impact potential is not considered to be ecologically significant at a population level. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

Seabirds

Seabirds, specifically shags, have been identified through literature as a culturally significant species (Malgana Land and Sea Management et al. 2021), as well as a resource (seabird eggs; Smyth 2007). Direct impact to communities using these resources will inherently occur when the resource disappears, is displaced or suffers a reduction in population. Therefore, these species (as resources) will be impacted where there is an impact at the species/population level. Intangible cultural heritage may also include the transmission of cultural knowledge about seabirds, such as nesting areas, hunting areas and migratory patterns. Such cultural knowledge may be associated with various cultural functions and activities that support the social and economic life of a community (Fijn 2021). Inter-generational transmission of cultural knowledge relating to seabirds may be impacted where changes to population or behaviour results in reduced sightings (e.g. through population decline, changes to migration routes or changes to migration seasonality). This transfer of knowledge may be integral to managing a group's intangible cultural heritage (UNESCO 2003).

As described in the relevant environmental impact assessments in Sections 6.7, the potential impacts from the Petroleum Activities Program on seabirds is assessed to be no lasting effect. The potential for temporary behavioural disturbance localised around vessels from light is not expected to result in a substantial adverse effect on species' population, and light emissions will not seriously disrupt the lifecycle of an ecologically significant proportion any migratory bird species. In terms of risk, as described in Section 6.8.2, a change in marine fauna behaviour or injury/mortality to seabirds and migratory shorebirds may occur due to a change in water or sediment quality following an unplanned hydrocarbon release. Given hydrocarbon characteristics, expected rapid weathering to below impact thresholds, and the mobile transient nature of individuals, unplanned hydrocarbon releases are not expected to substantially modify, destroy or isolate an area of important habitat for migratory species. As such, cultural values and intangible cultural heritage associated with these species are expected to be maintained.

Benthic habitats (coral, seagrass)

Through consultation, First Nations groups identified benthic habitats as valuable for their ecological values, including corals attracting fish and seagrass providing shelters for fauna, as well as an important habitat for dugongs. Additionally, coral is valued by MAC for its aesthetic values.

⁴² Squid and octopus are considered to be impacted through similar impact pathways as fish, and hence the conclusion represented here are considered appropriate for cephalopods.

As described in the relevant environmental impact assessments in Sections 6.7, the potential impacts from the Petroleum Activities Program on benthic habitats is assessed to be no lasting effect. Specifically, elevated suspended sediment from dredging activities in Commonwealth waters are predicted to result in detectable change to water quality with no impact to benthic communities and habitats, with direct removal limited to the sparse epifauna habitat. Further, elevated suspended sediments from dredging activities in Commonwealth waters are not predicted (based on modelling) to interact with coral larvae (both pelagic and during settlement) at concentrations that may impact the various developmental stages. Potential environmental impacts to coral communities have been assessed in Section 6.7 and controls C2.2 and C2.10 have been adopted.

In terms of risk, as described in Section 6.8.2, a change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release. Given hydrocarbon characteristics, rapid weathering, short-term exposure, as well as the response strategies planned to be deployed, an unplanned release is not expected to result in a level of exposure to coral and seagrass that would cause an adverse impact on marine ecosystem functioning or integrity results. As such, cultural values and intangible cultural heritage associated with benthic habitats are expected to be maintained.

Shoreline Habitats (mangroves)

Through consultation, First Nations groups identified shoreline habitats as valuable for their ecological values, including mangroves for providing shelter to marine invertebrates, which are identified resources, and potential nursery for turtles. Literature also notes that mangroves are also valued for the flora and fauna they are associated with and support (Commonwealth of Australia 2002) and Smyth (2007) reports that mangrove seeds are used as a resource by Ngarda-Ngarli.

There is no overlap between the Operational Area and mangrove habitat, and no planned impacts to mangroves from the Petroleum Activities Program. In terms of risk, as described in Section 6.8.2, a change in habitat may occur due to a change in water or sediment quality following an unplanned hydrocarbon release. Given hydrocarbon characteristics, rapid weathering, the low predicted volume ashore (3 m³), as well as the response strategies planned to be deployed, an unplanned release is not expected to have a substantial adverse impact on marine ecosystem functioning or integrity. As such, cultural values and intangible cultural heritage associated with shoreline habitats are expected to be maintained.

Conclusion

The impact and risk assessment for cultural features and heritage values has determined that the planned activities are unlikely to result in an impact greater than negligible (F) and unplanned activities are assessed to have a residual risk rating of moderate (or lower). Woodside will continue to consider new heritage information as it becomes available (See C 16.2).

ALARP Demonstration	<i>As marine ecosystems may hold both cultural and environmental value (see Section 4.9.1), with cultural and environmental values intrinsically linked, in addition to the specific controls for cultural features and heritage values, the controls and performance standards in section 6.7 and 6.8 will reduce impacts to cultural features and heritage values, including marine species and habitats.</i>				
	Control considered	Feasibility (F) & Cost/ Sacrifice (Cs)	Benefit in Impact/Risk Reduction	Proportionality	Adopted
	Apply a 'living heritage' ⁴³ management approach. Woodside seeks advice and incorporates Traditional Custodian	F: Yes CS: Minimal	Implementation of the 'living heritage' approach pays acknowledgement and respect to Traditional Custodian communities. It supports the transfer	Benefits outweigh cost/ sacrifice.	Yes C 16.1

⁴³ Living heritage supports community and individual identity. Intangible cultural heritage is 'living heritage' that is inherited from ancestors and passed on to their descendants. It is comprised of many influences, including oral traditions, art, social practices, rituals and ceremonies, cultural knowledge and practices. It is transmitted from generation to generation, and evolves in response to the environment. Woodside applies a 'living heritage' approach to its cultural heritage management. This includes ensuring that Traditional Custodians are given voice to identify interests, transmit information and express concerns. Woodside works with Traditional Custodians to support and follow appropriate cultural protocols, including calling to Country, conducting smoking ceremonies (in areas where this custom is appropriate) and undertaking cultural awareness. Woodside will collaborate and provide relevant information it holds to groups such as Heritage Management Committees where they are established.

<p>cultural knowledges across our activities. Cultural safety considerations are factored for our workforce and the Traditional Custodian community.</p>	<p>of cultural knowledges and is an effective strategy to manage intangible cultural values.</p>	<p>F: Yes CS: Substantial costs</p>	<p>Implementation of this program is anticipated to allow Woodside to improve their understanding of potential cultural values and Heritage in the Operational Area and or EMBA and then develop avoidance or mitigation strategies in collaboration with Traditional Custodians if impacts to cultural values are identified.</p>	<p>Benefits outweigh cost/sacrifice</p>	<p>Yes C 16.2</p>
<p>Implement a program, which is compliant with Corporate Woodside Policies Strategies and procedures, to undertake ongoing consultation with Traditional Custodians whose functions, interests and activities may be affected by the Petroleum Activities Program.</p>	<p>F: Yes CS: Substantial costs</p>	<p>Implementation of activities and associated controls to ALARP and acceptable levels supports the maintenance of cultural features and heritage values</p>	<p>Benefits outweigh cost/sacrifice</p>	<p>Yes C 16.3</p>

<p>Should it be identified that relevant cultural authorities may be affected in the unlikely event of a spill, Woodside will engage with those parties as appropriate and in alignment with the FSP.</p>	<p>F: Yes CS: Minimal</p>	<p>Engaging with relevant cultural authorities that may be impacted by a spill will allow the Traditional Custodians to identify areas of concern.</p>	<p>Benefits outweigh cost/sacrifice</p>	<p>Yes Adopted, see Appendix D</p>
---	-------------------------------	--	---	--

ALARP Statement On the basis of the impact and risk assessment outcomes and use of the relevant tools appropriate to the decision type (i.e. Decision Type A, Section 2.3.3), Woodside considers the adopted controls appropriate to manage the potential impacts and risks to cultural features and heritage values. As no reasonable additional/alternative controls were identified that would further reduce the impacts without grossly disproportionate sacrifice, the impacts are considered ALARP.

Acceptability Statement The impact and risk assessment has determined that, given the adopted controls, planned activities are unlikely to result in an impact greater than negligible (F)⁴⁵ and unplanned activities are assessed to have a residual risk rating of moderate (or lower).

The Petroleum Activities Program and the EMBA are not expected to have a significant impact (e.g. changes in population levels) on MNES including marine fauna with a First Nations connection with, or

⁴⁵ Noting that as the receptor sensitivity is high the impact significance level is Slight (E).

traditional use in nearshore areas as defined in Section 4.9.1. While the activity will occur on the Ancient Landscape Woodside has:

- Consulted with MAC identified concerns associated with activities of this EP in Commonwealth waters. To address relevant concerns (see Appendix F, Table 1) additional controls (C 16.7 and C 16.8) have been included in the EP. In addition, recent engagement with MAC has confirmed they have no concerns at this time.
- Undertaken desktop assessments by qualified professionals, using remote sensing techniques, to identify known or potential underwater cultural heritage have been undertaken (refer to Section 4.9.1) and an unexpected finds procedure will be implemented (C 2.10). Therefore, the activity is not inconsistent with *Underwater Cultural Heritage Guidance for Offshore Developments* and the *DRAFT Guidelines to Protect Underwater Cultural Heritage* under the UCH Act.

In addition, Woodside has engaged with Traditional Custodians adjacent to the EMBA to understand the cultural features and heritage values that may occur and potential impacts from the activity. Additional controls considered and adopted, to minimise impacts to whales and associated songlines (C 6.5) have been discussed with the relevant persons who have raised the value.

The Program of Ongoing Engagement with Traditional Custodians (EPO 30 and C 16.2) and 'living heritage' management approach (C 16.1) have been developed to enable Woodside to manage cultural values which may be identified at any time during Woodside's activities via ongoing dialogue with Traditional Custodians.

Further opportunities to reduce the impacts have been investigated above. The potential impacts and risks are considered acceptable if the adopted controls are implemented. Therefore, Woodside considers the adopted controls appropriate to manage the impacts and risks to cultural features and heritage values to a level that is acceptable, if ALARP.

Key Environmental Performance Outcomes, Standards and Measurement Criteria related to Cultural Features and Heritage Values⁴⁶			
EPO	Adopted Control(s)	EPS	MC
<p>EPO 23 Undertake the Petroleum Activities Program in a manner that will prevent a substantial adverse effect on a population of marine mammals or the spatial distribution of the population.</p> <p>EPO 28 No impact to cultural features and heritage values, as stated in Table 4-27, greater than a consequence level of F⁴⁷ from the Petroleum Activities Program</p> <p>EPO 30 Woodside will actively support Traditional Custodians' capacity for ongoing engagement and consultation on environment plans for the purpose of avoiding impacts to cultural heritage values.</p> <p>EPO 31 No adverse impact to unexpected finds of Underwater Cultural Heritage without a permit⁴⁸.</p> <p>EPO 32 New cultural values identified through the Program and supporting studies will be managed to ALARP and an</p>	<p>C 16.1 Apply a 'living heritage' management approach. 	<p>C 6.7 Manage vessel speed in the humpback and PBW whale BIAs in migration seasons within the Operational Area (excluding Pilbara Port)</p>	<p>PS 6.5.2 Refer to Section 6.7.6</p> <p>PS 6.7.1 Vessel speeds in the Operational Area (excluding Pilbara Port) are restricted ≤10kn:</p> <ul style="list-style-type: none"> • When in the pygmy blue whale migration BIA during PBW migration periods (Apr-Jul & Oct-Jan inclusive) • When in the humpback whale migration BIA during migration periods (May – Aug and Aug - Oct inclusive). 	<p>MC 6.7.1 Records demonstrate vessel speeds, in the Operational Area, transiting in whale BIAs in migratory seasons, were ≤ 10 knots.</p>

⁴⁹ Underwater Cultural Heritage is defined as any trace of human existence that has a cultural, historical or archaeological character and is located under water, in accordance with the UCH Act

7 IMPLEMENTATION STRATEGY

7.1 Overview

Regulation 14 of the Environment Regulations requires an EP to contain an implementation strategy for the activity. The implementation strategy for the Petroleum Activities Program confirms fit for purpose systems, practices and procedures are in place to direct, review and manage the activities so environmental risks and impacts are continually being reduced to ALARP and are acceptable, and that EPOs and standards outlined in this EP are achieved.

Woodside, as Operator, is responsible for ensuring the Petroleum Activities Program is managed in accordance with this Implementation Strategy and the WMS (see Section 1.8.4).

7.2 Systems, Practice and Procedures

All operational activities are planned and carried out in accordance with relevant legislation and standards, management measures (i.e. controls) identified in this EP and internal environment standards and procedures (Section 6).

The systems, practices and procedures that will be implemented are listed in the Performance Standards (PS) contained in this EP. Document names and reference numbers may be subject to change during the statutory duration of this EP and is managed through a Change Register and update process.

7.2.1 Assessment of Project Fluids

All chemicals that may be operationally released or discharged to the marine environment by the Petroleum Activities Program are evaluated using a defined framework and set of tools to ensure the potential impacts are acceptable, ALARP and meet Woodside’s expectation for environmental performance.

The chemical assessment process follows the principles outlined in the Offshore Chemical Notification Scheme (OCNS), which manages chemical use and discharge in the United Kingdom (UK) and the Netherlands. It applies the requirements of the Convention for the Protection of the Marine Environment of the North-East Atlantic (OSPAR Convention). The OSPAR Convention is widely accepted as best practice for chemical management.

All chemical substances on the OCNS ranked list of registered products have an assigned ranking based on toxicity and other relevant parameters, such as biodegradation and bioaccumulation, in accordance with one of two schemes (as shown in Figure 7-1):

- Hazard Quotient (HQ) Colour Band: Gold, Silver, White, Blue, Orange or Purple (listed in order of increasing environmental hazard).
- OCNS Grouping: E, D, C, B or A (listed in order of increasing environmental hazard). Used for inorganic substances, hydraulic fluids and pipeline chemicals only.

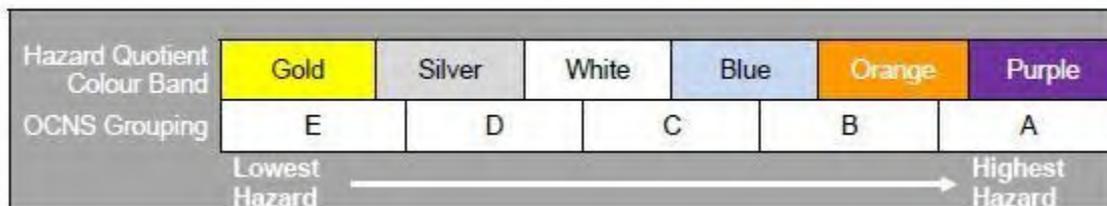

Figure 7-1: OCNS ranking scheme

Chemicals fall into the following assessment types:

- No further assessment: Chemicals with an HQ band of Gold or Silver or an OCNS ranking of E or D with no substitution or product warnings do not require further assessment. Such chemicals do not represent a significant impact on the environment under standard use scenarios and are therefore considered ALARP and acceptable.
- Further assessment/ALARP justification required: The following types of chemicals require further assessment to understand the environmental impacts of discharge into the marine environment:
 - chemicals with no OCNS ranking
 - chemicals with an HQ band of White, Blue, Orange or Purple or an OCNS ranking of A, B or C
 - chemicals with an OCNS product or substitution warning.

This includes assessing the ecotoxicity, biodegradation and bioaccumulation of the chemicals in the marine environment in accordance with the Centre for Environment, Fisheries and Aquaculture Science (CEFAS) Hazard assessment and the Department of Mines and Petroleum (DMP) Chemical Assessment Guide: Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

Ecotoxicity

Chemical ecotoxicity is assessed using the criteria used by CEFAS to group chemicals based on ecotoxicity results (Table 7-1). If a chemical has an aquatic or sediment toxicity within the criteria for the OCNS grouping of D or E, this is considered acceptable in terms of ecotoxicity.

Table 7-1: CEFAS OCNS grouping based on ecotoxicity results

Initial Grouping	A	B	C	D	E
Results for aquatic-toxicity data (ppm)	<1	>1–10	>10–100	>100–1000	>1000
Results for sediment toxicity data (ppm)	<10	>10–100	>100–1000	>1000–10,000	>10,000

Note: Aquatic toxicity refers to the Skeletonema costatum EC50, Acartia tonsa LC50 and Scophthalmus maximus (juvenile turbot) LC50 toxicity tests; sediment toxicity refers to Corophium volutator LC50 test.

Biodegradation

The biodegradation of chemicals is assessed using the CEFAS biodegradation criteria, which align with the categorisation outlined in the DMP Chemical Assessment Guide: Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

CEFAS categorises biodegradation into the following groups:

- readily biodegradable: results of >60% biodegradation in 28 days to an OSPAR harmonised offshore chemical notification format (HOCNF) accepted ready biodegradation protocol
- inherently biodegradable: results >20% and <60% to an OSPAR HOCNF accepted ready biodegradation protocol or result of >20% by OSPAR accepted inherent biodegradation study
- not biodegradable: results from OSPAR HOCNF accepted biodegradation protocol or inherent biodegradation protocol are <20%, or half-life values derived from aquatic simulation test indicate persistence.

Chemicals with >60% biodegradation in 28 days to an OSPAR HOCNF accepted ready biodegradation protocol are considered acceptable in terms of biodegradation.

Bioaccumulation

The bioaccumulation of chemicals is assessed using the CEFAS bioaccumulation criteria, which align with the categorisation outlined in the DMP Chemical Assessment Guide: Environmental Risk Assessment of Chemicals used in WA Petroleum Activities Guideline.

The following guidance is used by CEFAS:

- non-bioaccumulative: Log Pow <3, or BCF ≤100 and molecular weight is ≥700
- bioaccumulative: Log Pow ≥3 or BC >100 and molecular weight is <700.

Chemicals that meet the non-bioaccumulative criteria are considered acceptable. If a product has no specific ecotoxicity, biodegradation or bioaccumulation data available, the following options are considered:

- Environmental data for analogous products can be referred to where chemical ingredients and composition are largely identical.
- Environmental data may be referenced for each separate chemical ingredient (if known) within the product.

Alternatives

If no environmental data is available for a chemical or if the environmental data does not meet the acceptability criteria outlined above, potential alternatives for the chemical will be investigated, with preference for options with an HQ band of Gold or Silver, or OCNS Group E or D with no substitution or product warnings.

Decision

Once the further assessment/ALARP justification has been completed, the relevant environment adviser must concur that the environmental risk as a result of chemical use is ALARP and acceptable.

7.2.2 Woodside IMS risk assessment process

7.2.2.1 Objective and scope

To minimise the risk of introducing IMS as a result of the Petroleum Activities Program, all applicable vessels and immersible equipment will be subject to Woodside's IMS risk assessment process (unless exempt as outlined below).

The objective of the risk assessment process is to identify the level of threat a contracted vessel, or immersible equipment poses if no additional risk reduction management measures are implemented. This allows Woodside (and its contractors) to apply management options that are commensurate to the identified level of risk.

In context of the activities specified in Section 3, the IMS risk assessment process does not apply to the following:

- Vessels or immersible equipment that do not plan to enter the IMS Management Area (IMSMA)⁵⁰ or operational areas defined in environmental approvals
- 'New build' vessels launched less than 14 days prior to mobilisation

⁵⁰ IMSMA is based on current legal framework and includes all nearshore waters around Australia, extending from the lowest astronomical tide mark to 12 nm from land (including Australian territorial islands). The IMSMA also includes all waters within 12 nm from the 50 metre depth contour outside of the 12 nm boundary (i.e. Submerged reefs and atolls).

- Vessels or immersible equipment which have been inspected by a suitably qualified IMS inspector who has classified the vessels or immersible equipment as acceptably low risk no more than 14 days prior to mobilisation
- Locally sourced vessels or immersible equipment from within the Pilbara locally sourced zone⁵¹. Vessels, or immersible equipment are defined as Locally Sourced when the same supply facilities/port have been used since their last IMS inspection, full hull clean in dry dock or application of antifouling coating (AFC⁵²).

7.2.2.2 Risk assessment process

Woodside’s IMS risk assessment process was developed with regard to the national biofouling management guidelines for the petroleum production and exploration industry and guidelines for the control and management of a ships’ biofouling to minimise the transfer of invasive aquatic species (IMO Guidelines, 2011).

In order to effectively evaluate the potential for vessels and immersible equipment to introduce IMS, a risk assessment process has been developed to score and evaluate the risk posed by each Project vessel, or immersible equipment planning to undertake activities within the IMSMA / Operational Area. The risk assessment process considers a range of factors, as listed in Table 7-2 and Table 7-3.

The IMS risk assessments will be undertaken by a trained environment adviser who has completed relevant Woodside IMS training or by a qualified and experienced IMS inspector. A QA/QC process is implemented for all Woodside conducted IMS risk assessments where a secondary trained environment adviser verifies the assessment to minimise the risk of misapplication and errors within the risk assessment process.

Table 7-2: Key factors considered as a part of the risk assessment process for vessels

Factors	Details
Vessel type	The risk of IMS infection varies depending on the type of vessel undertaking the activity. A higher risk rating is applied for more complex, slow-moving vessels (e.g., dredges) in comparison to simple vessels (e.g., crew transfer vessel).
Recent IMS inspection and cleaning history, including for internal niches	In the case of biofouling on external hull niches, different risk ratings are applied dependant on whether out-of-water or in-water IMS inspections by qualified IMS inspectors and cleaning (if required) have been undertaken prior to contract commencement. If an IMS inspection (and clean if required) has not been undertaken in the past six months (from the time of contract commencement), the highest risk factor is applied. The risk factor then lessens for vessels as the time between inspection and mobilisation reduces.
Out-of-water period before mobilisation	A risk reduction factor can be applied for vessels that are hauled out and then mobilised as deck cargo or by road during mobilisation, therefore becoming air dried over an extended period. Risk reduction factor increases with exposure time out of water.
Age and suitability of AFC at mobilisation date	AFC manufacturers provide a range of coatings, each designed to avoid premature coating failure if it is correctly applied and matched to the vessel’s normal speeds and activity profile (i.e., proportion of time spent stationary or below three knots), and its main operational region (i.e., tropical, sub-tropical temperate). If the AFC type is deemed to be unknown, unsuited or absent, the highest risk value is applied. If the AFC type is suitable the risk factor applied reduces with age since application.

⁵¹ The Pilbara Zone includes Port, nearshore and offshore movements between Exmouth and Port Headland (excluding high environmental value areas, World Heritage Areas, Commonwealth Marine Reserve Sanctuary Zones and State Marine Management Areas and Marine Parks).

⁵² Vessels and immersible equipment can still be classified as locally sourced even if the AFC application occurred in a different port provided the amount of time between AFC application and departure to the locally sourced area (i.e. period of time in waters <12nm/50m water depth) did not exceed consecutive 7 days or the period of time the vessel or immersible equipment has spent within the locally sourced zone exceeds 1 year (i.e. the risk of introducing a species from a different location has already passed).

movement. These will be assessed on a case-by-case basis and may include, but not limited to, the following:

- Inspection (desktop, in-water or dry dock) by a suitably qualified and experienced IMS inspector to verify risk status. Where practicable, the inspection shall occur within seven days (but not more than 14 days) prior to final departure to the Operational Area.
- In-water or dry dock cleaning of the hull and other niche areas. This is typically applied where the risk assessment outcome is High risk driven by the age of the AFC on the vessel and its time spent in similar climatic region ports.
- Treatment of vessels internal seawater systems. This is typically applied in isolation for vessels with AFC applied to their hull within the last twelve months and where subsequent assessment through the process achieves a Low risk rating.
- Limiting the duration that the vessel spends within the IMSMA to a maximum of 48 hours (cumulative entries)⁵³. This is applicable for Uncertain risk vessels only.
- Reject the vessel.

Project vessels and immersible equipment are required to be a low risk of introducing IMS prior to entering the Operational Area.

7.3 Woodside Decommissioning Framework

Decommissioning is a planned activity for the offshore oil and gas industry. Current best practice is for decommissioning to include:

- designing for decommissioning during the development phase of projects / facilities
- maintaining and removing property, equipment and infrastructure, such as a facility or a pipeline, and plugging wells associated with a petroleum activity
- assessing decommissioning options and opportunities during the operational life of the facility leading up to cessation of production
- selecting, developing and planning the selected decommissioning option
- executing decommissioning plans; and
- restoring the marine environment.

This assists with compliance with Section 572 (3) of the OPGGS Act, which requires titleholders to remove property when it is neither used, nor to be used, in connection with the operations.

7.3.1 Decommissioning Planning

Decommissioning planning generally commences 2-10 years prior to Cessation of Production (CoP) (Figure 7-2). The timeframe selected for decommissioning planning depends on the complexity of the infrastructure requiring decommissioning.

⁵³48 hours is considered an appropriate and ALARP management control, as it significantly reduces the potential for any IMS associated with a vessel to successfully establish suitable habitat within the IMSMA. This reduction of risk is primarily achieved via a direct reduction of the propagule pressure associated with a particular vessel movement.

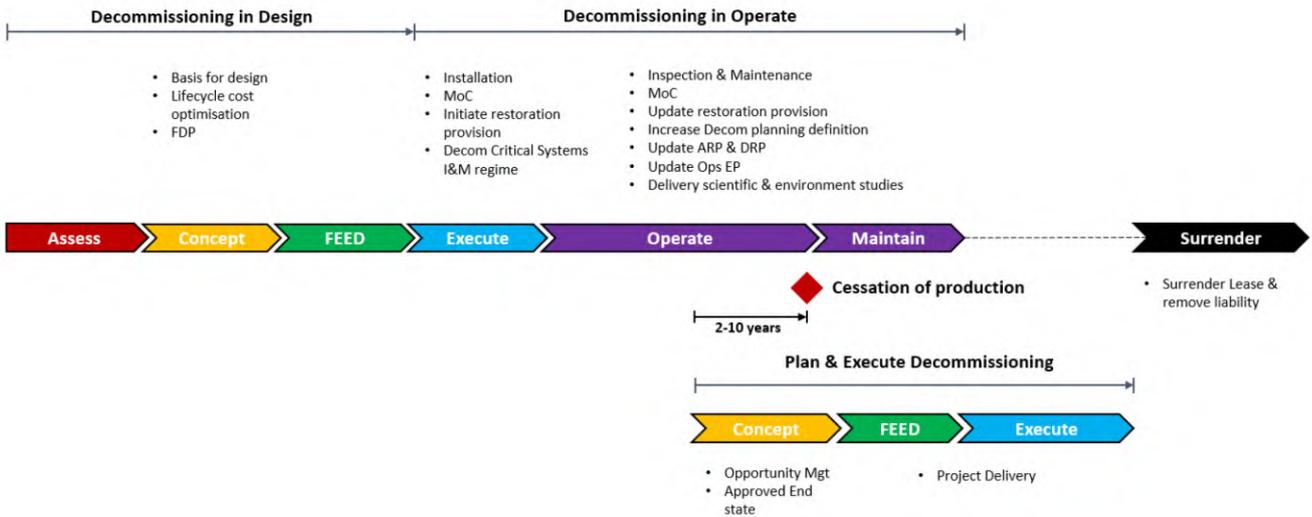

Figure 7-2: Woodside's process for decommissioning planning

7.3.1.1 Scarborough Decommissioning Strategy

Section 3.11.1 describes the process by which the equipment will be tracked and added to the Inventory for the title. In proactively planning for decommissioning, the following information has been collated within a Scarborough Decommissioning Strategy for major infrastructure, including the Trunkline:

- Specifications
- Compositions
- Decommissioning critical systems
- IMR plans
- Feasibility of removal options

This information will be reviewed for accuracy and regulatory compliance prior to start-up, before being captured in Maintenance Builds / Plans and handed over to Production for continual management throughout field life. Ancillary equipment will be tracked and inventoried in the same way, and removal options will be subject to future decommissioning planning, as per Figure 7-2.

The identified decommissioning critical systems are asset systems that are designed to facilitate the flushing, cleaning and decommissioning of infrastructure. These systems were identified through consultation with package leads and will be appropriately maintained. The standard Inspection, Maintenance, Monitoring and Repair requirements will ensure that the systems remain in functional condition, in connection with operations until EOFL.

7.3.1.2 Scarborough Trunkline Decommissioning

In order to satisfy future decommissioning obligations, including the requirements of the OPGGS Act, the following design and functional requirements of the export trunkline have been implemented:

- The export trunkline system design will allow for sweeping with sea water or other environmentally acceptable fluid, with capability to return to hydrocarbon separation facilities on the FPU or onshore for treatment.
- Adequate isolations will be provided so that subsea system hydrocarbon removal operations can be performed in accordance with relevant safety procedures and engineering standards.

- The trunkline will be able to be cleaned of hydrocarbons and contaminants, in situ, to a level based on an ALARP assessment.
- The export trunkline is designed to be feasible to remove from the seabed. A technical decommissioning assessment was undertaken and a Decommissioning Plan developed. The plan may be used at the time of decommissioning, with due consideration of best environmental outcome and technological advances available at the time, noting detailed plans and justification will be subject of a future EP. It considers various removal options:
 - Dredging/jetting and removal of rock cover to expose trunkline if sections are buried/embedded
 - Pigging and cleaning techniques
 - Removal by reverse S-lay and cutting into sections onboard a PLV
 - Removal by cutting subsea and retrieval by crane in some shallower water sections
 - Isolation and retrieval of structures by lifting

Although the trunkline contains no decommissioning critical systems, essential for the feasibility of decommissioning, there are several items that de-risk the decommissioning activity. The standard Inspection, Maintenance, Monitoring and Repair are designed to ensure that the following items remain in functional condition for use in connection with the operations until EOFL. Although functionality of these items does not impact overall decommissioning feasibility it is intended to minimise the complexity of future decommissioning activities:

- PLET 32" connection system
- PLET 32" valve
- ILTA 16" connection system
- ILTA 16" valves (2-off)

The Trunkline Decommissioning Plan will be integrated within suitable operational documents, ensuring the system, used in connection with operations, is appropriately maintained throughout field life. More detailed preparation for decommissioning execution, including relevant plans and procedures, will be developed as per the timeline in Figure 7-2.

7.4 Roles and Responsibilities

Key roles and responsibilities for Woodside and contractor personnel relating to implementing, managing and reviewing this EP are described in Table 7-4. Roles and responsibilities for oil spill preparation and response are outlined in Appendix D and the [Woodside Oil Pollution Emergency Arrangements \(Australia\)](#).

It is the responsibility of all Woodside employees and contractors to implement the Woodside *Environment and Biodiversity Policy* (Appendix A) and *Health and Safety Policy* in their areas of responsibility and that the personnel are suitably trained and competent in their respective roles.

Table 7-4: Roles and responsibilities

Title (role)	Environmental Responsibilities
Office-based Personnel	
Woodside Project Manager (or delegate/s)	<ul style="list-style-type: none"> • Monitor and manage the activity so it is undertaken as per the relevant standards and commitments in this EP. • Notify the Woodside Environment Adviser of any scope changes in a timely manner. • Liaise with regulatory authorities as required. • Review this EP as necessary and manage change requests. • Ensure all project and support vessel crew members complete an HSE induction. • Verify that contractors meet environmental related contractual obligations. • Confirm environmental incident reporting meets regulatory requirements (as outlined in this EP) and Woodside’s Health, Safety and Environment Reporting and Investigation Procedure. • Monitor and close out corrective actions identified during environmental monitoring or audits.
Woodside Environmental Adviser	<ul style="list-style-type: none"> • Verify relevant Environmental Approvals for the activities exist prior to commencing activity. • Track compliance with performance outcomes and performance standards as per the requirements of this EP. • Prepare environmental component of relevant Induction Package. • Assist with the review, investigation and reporting of environmental incidents. • Ensure environmental monitoring and inspections/audits are undertaken as per the requirements of this EP. • Liaise with relevant regulatory authorities as required. • Assist in preparation of external regulatory reports required, in line with environmental approval requirements and Woodside incident reporting procedures. • Monitor and close out corrective actions (Campaign Action Register (CAR)) identified during environmental monitoring or audits. • Provide advice to relevant Woodside personnel and contractors to assist them to understand their environment responsibilities. • Liaise with primary installation vessel contractors to ensure communication and understanding of environment requirements as outlined in this EP and in line with Woodside’s Compass values and management systems.
Woodside Corporate Affairs Adviser	<ul style="list-style-type: none"> • Prepare and implement the Stakeholder Consultation Plan for the Petroleum Activities Program. • Report on stakeholder consultation. • Ongoing liaison and notification as required as per Section 7.17.
Woodside Marine Assurance Superintendent	<ul style="list-style-type: none"> • Conducts relevant audit and inspection to confirm vessels comply with relevant Marine Orders and Woodside Marine Charters Instructions requirements to meet safety, navigation and emergency response requirements.
Woodside CICC Duty Manager	On receiving notification of an incident, the Woodside CICC Duty Manager shall:

Title (role)	Environmental Responsibilities
	<ul style="list-style-type: none"> • establish and take control of the IMT and establish an appropriate command structure for the incident • assess situation, identify risks and actions to minimise the risk • communicate impact, risk and progress to the Crisis Management Team and stakeholders • develop the incident action plan (IAP) including setting objectives for action • approve, implement and Manage the IAP • communicate within and beyond the incident management structure • manage and review safety of responders • address the broader public safety considerations • conclude and review activities.
Vessel-based Personnel	
Vessel Master (all vessel types)	<ul style="list-style-type: none"> • Ensure the vessel management system and procedures are implemented. • Ensure personnel commencing work on the vessel receive an environmental induction that meets the relevant requirements specified in this EP. • Ensure personnel are competent to undertake the work they have been assigned. • Verify SOPEP drills are conducted as per the vessel's schedule. • Ensure the vessel Emergency Response Team (ERT) has been given sufficient training to implement the SOPEP. • Ensure any environmental incidents or breaches of relevant Environmental Performance Outcomes or performance standards detailed in this EP, are reported immediately to the Woodside Site Representative. • Ensure corrective actions for incidents or breaches are developed, communicated to the Woodside Site Representative, and tracked to close out in a timely manner. Close out of actions is communicated to the Woodside Site Representative.
Vessel Logistics Coordinators	<ul style="list-style-type: none"> • Ensure waste is managed on the relevant vessels and sent to shore as per the relevant Waste Management Plan.

Title (role)	Environmental Responsibilities
Vessel HSE Advisers*	<ul style="list-style-type: none"> • Support the Woodside Site Representative to ensure the controls detailed in this EP relevant to offshore activities are implemented on the vessels and help collect and record evidence of implementation (other controls are implemented and evidence collected onshore). • Support the Woodside Site Representative to ensure the EPOs are met and the PSs detailed in this EP are implemented on the vessels • Support the Woodside Site Representative to ensure environmental incidents or breaches of outcomes or standards outlined in this EP, are reported, and corrective actions for incidents and breaches are developed, tracked and closed out in a timely manner. • Ensure periodic environmental inspections/reviews are completed and corrective actions from inspections are developed, tracked and closed out in a timely manner. • Review contractors' procedures, input into Toolbox talks and JSAs. • Provide day-to-day environmental support for activities in consultation with the Woodside Environment Adviser.
Offshore Construction Manager*	<ul style="list-style-type: none"> • Confirm that activities are undertaken in accordance with this EP, as detailed in the Woodside approved Contactor Environmental Management Plan • Ensure personnel commencing work on the project receive a relevant environmental induction that meets the requirements specified in this EP • Ensure personnel are competent to undertake the work they have been assigned • Ensure any environmental incidents or breaches of objectives, standards or criteria outlined in this EP, are reported immediately to the Woodside Responsible Engineer or Vessel Master.
Woodside Site Representative (WSR) / Resident Engineer*	<ul style="list-style-type: none"> • Ensure activities are undertaken as detailed in this EP. • Ensure the management measures made in this EP are implemented on the vessel • Ensure environmental incidents or breaches of objectives, standards or criteria outlined in this EP, are reported as per the Woodside Corporate Event Notification Matrix • Verify HSE improvement actions identified during the project are implemented where practicable • Ensure periodic environmental inspections are completed.

**Apply to PV and construction vessel(s) – other vessels in the Petroleum Activities Program will have different levels of crewing. Where named roles are not present onboard, responsibilities will fall to the PV or construction vessel personnel who will manage the other vessels accordingly.*

7.5 Heritage Management Committee Implementation

Following consultations with MAC it was requested that Woodside develop a mechanism to address the management of new heritage information. In particular it was requested that a formal mechanism be established to address any new ethnographic values identified through an additional ethnographic survey.

On 1 February 2022, Woodside proposed the establishment of a Heritage Management Committee (HMC) whose role would be “to consider the necessary mitigation measures required to address any new heritage information arising following certain milestones related to the Scarborough Project” and “advise Woodside where any additional mitigation measures are recommended and of any other actions MAC or Woodside should consider”. This proposal required recommendations of the HMC to be unanimous, without limiting MAC’s right to provide additional advice to Woodside.

In a letter signed 7 October 2022, MAC responded to Woodside’s proposal, specifying that membership of the HMC should include:

- MAC’s Circle of Elders;
- MAC’s Board and/or executive;
- MAC staff;
- Representatives from Woodside; and
- Appropriately qualified heritage experts agreed between MAC and Woodside.

MAC’s letter also clarified the milestones which may trigger a meeting of the HMC:

- Finalisation of a report from a future ethnographic survey;
- Conclusion of any future heritage assessment activities agreed by Woodside and MAC to inform the management of heritage for the Scarborough Project;
- Any proposed changes to the methodology for construction of the Scarborough Project requiring an update to the Scarborough CHMP or the management of Cultural and Spiritual Values;
- Following the discovery or identification of new heritage values relevant to the construction or operation of the Scarborough Project; and
- Following the discovery or identification that heritage values previously identified beyond the Scarborough Project are also relevant to the construction or operation of the Scarborough Project.

It is intended that recommendations of the HMC will be implemented where they (independently or in conjunction with other actions) lower the risk of impacts to heritage to a level that is as low as reasonably practicable (ALARP). Woodside will also comply with relevant regulations, legislation and principles and requirements of this EP.

The process for addressing new information, therefore, is as follows:

- Upon becoming aware of any matter that would trigger a meeting of the HMC, Woodside is to notify MAC and request a meeting of the HMC.
- Woodside and MAC are to agree on the appropriate heritage experts to be engaged. Timing of the meeting should be as soon as practicable, but it is acknowledged that flexibility will be required particularly during law time to account for the cultural obligations of elders.
- Relevant information must be made available to attendees prior to the meeting.
- The HMC is to meet to discuss the relevant information provided and develop recommendations to Woodside.

- Woodside must implement all ALARP recommendations of the HMC.
- Where the recommendations are not considered ALARP—for example due to implementation of the recommendation resulting in a risk to safety or violation of a regulation or legislation—Woodside must:
 - Notify the members of the HMC that it will not implement the recommendation, the reason for not implementing the recommendation, and any alternative actions being undertaken to align with ALARP,
 - Take reasonable steps to receive timely responses from the HMC to the notifications in a, proportionate to the urgency of action to be undertaken
 - Implement any alternative actions committed to in a with necessary modifications after consideration of the responses in b, and
 - Respond to any subsequent correspondence from HMC members

7.6 Thalanyji Sea Country Management Process

During consultation, BTAC, on behalf of the Thalanyji People, advised it has a cultural obligation to care for the environmental values of Sea Country (refer to Appendix F, Table 1).

In correspondence from 20 February 2023 (refer to Appendix F, Table 1) BTAC advised that:

- BTAC seeks support from Woodside to enable BTAC to define and articulate its values on Sea Country in a manner that could be more clearly understood by the offshore sector, government, and the community. This would enable BTAC and Woodside to collaborate to develop effective management plans that can provide adequate protection to Sea Country values; and
- BTAC seeks support from Woodside to obtain technical support to review the information and provide BTAC and its members with feedback on the project risks to Sea Country and help BTAC contemplate the potential management controls that could be developed to protect its values and interests.

Woodside's offer of technical support is detailed in Appendix F, Table 1, but this has not yet been accepted.

A review of publicly available literature has been undertaken to seek clarity on the extent of Sea Country for Thalanyji people. (Section 4.9.1.5.3) The publicly available information considered does not record any instances of Thalanyji sea country extending beyond the Montebello Multiple Use Zone within the vicinity of the islands.

There are no credible planned impacts to the Montebello Islands, Barrow Island or the Mackerel Islands or the islands indicated in WC1999/045.

Woodside has developed a robust understanding of Thalanyji Sea Country cultural values and heritage features through publicly available information (Section 4.9.1.5.1) and consultation with BTAC under regulation 11A. Woodside considers that it has taken all reasonable and practicable steps to identify cultural features and heritage values of Thalanyji people in the EMBA that may be affected by the activity.

If further guidance from BTAC is received as part of ongoing consultation which changes Woodside's understanding of the extent of Thalanyji Sea Country, Woodside's Management of Change and Management of Knowledge process with EPO 28 will be applied to manage potential impact to newly identified cultural values or features to ALARP and Acceptable levels. This estimation does not limit the extent of consultation with BTAC or the features and values they are encouraged to identify and communicate.

Woodside will implement the process in Table 7-5 to ensure all reasonable steps have been taken to identify sea country values relative to BTAC through ongoing consultation.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Table 7-5: BTAC Ongoing Consultation

Activity	Timing
Woodside contacted BTAC to discuss the best way forward to consult with BTAC	Completed January 2023
Woodside and BTAC commenced correspondence regarding a consultation or engagement framework, including financial resourcing for BTAC	Ongoing since February 2023
BTAC confirmed that subject to formalising arrangements – for example under a collaboration agreement - BTAC agrees in principle for Woodside to include the statements described in the letter from Woodside dated 17 March.	Completed 18 April 2023
BTAC requested Woodside provide a draft presentation for BTAC’s board regarding Woodside’s activities on Thalanyji country, and draft key terms / key principles regarding a Collaboration Agreement	Completed 4 May 2023
Woodside provided to BTAC a draft of principles for a consultation framework, targeting having the framework agreed and in place by 31 July 2023	Completed 14 June 2023
Woodside wrote to BTAC inviting BTAC to submit a cost estimate to continue consultations and address items in the draft framework principles, in the interim whilst the framework is being agreed	Completed 14 July 2023
BTAC wrote to Woodside regarding the draft framework principles and proposed to forward Woodside a Costs Acceptance Letter to address resourcing for ongoing consultation	Completed 19 July 2023
Woodside provided BTAC with a draft presentation for BTAC’s board, including a map showing a consolidated EMBA - a consolidation of all single activity EMBA’s that have been notified to BTAC to date	Completed 20 July 2023
<p>1 Woodside requested an ethnographic assessment to be undertaken by BTAC, including:</p> <ul style="list-style-type: none"> • That the scope of works identifies the values of sea-country generally sufficient to inform all Woodside EPs; • That Woodside will cover all reasonable costs of this assessment, to be agreed upon receipt of a cost estimate from BTAC; • That, in order to ensure the independence of any assessment and confidence in the process and consultants, Woodside’s preference is for BTAC to manage the assessment, including selection of any consultant, but acknowledging the constraints on BTAC’s time and resources that where directed Woodside (or a consultant) is willing to provide in-kind support for the assessment, including some or all tasks required to coordinate the assessment; • That any resulting report or other materials will remain the intellectual property of BTAC, but that Woodside will retain a perpetual right to use the content of any non-culturally sensitive report or other materials produced for the purposes of project approvals and planning, including providing these in full to regulators and government authorities as needed, and that where culturally sensitive reports or other materials are produced a non-culturally sensitive (redacted or edited) version will be provided subject to the same perpetual right above; and • To minimise the burden of duplication on BTAC and allow prioritisation of this assessment any results of this assessment may be shared by BTAC with other proponents, and where other proponents require ethnographic assessment outside of the proposed scope but aligned with the assessment timeframes, the engaged consultants may perform the required additional work (including additional days of research, fieldwork etc.) as an extension of this assessment at the cost of those proponents (thus avoiding duplication of time and costs relating to logistics, administration etc.) • Reiterate commitment to undertaking ethnographic assessments with BTAC, Woodside will use all reasonable efforts so that the work is completed prior to Trunkline installation in the area estimated as relevant to BTAC, but subject to BTAC’s availability and priorities. 	<p>Completed 31 July 2023</p> <p>Follow up after 2 weeks and once monthly in September and October.</p> <ul style="list-style-type: none"> • Completed follow up 2 weeks on 15 August • Completed further follow up on 23 August

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Activity		Timing
2	<p>Woodside will continue to implement its Management of Change and Management of Knowledge processes where new information is communicated from BTAC (including as a result of the ethnographic survey proposed in item 1) at any time.</p> <ul style="list-style-type: none"> Seek to consult with BTAC on any identified cultural values and relevant management and mitigation measures Implement PS 16.3.1 which manages potential impact to newly identified cultural values or features to ALARP and Acceptable Levels 	Within 14 days of new cultural values being communicated from BTAC
3	Ongoing consultation as per Ongoing Program of Traditional Owner Consultation	Per Ongoing Program
4	Building capacity for the ongoing protection of country, including initiatives agreed with BTAC for the articulation of values on Sea Country in a manner that could be more clearly understood by the offshore sector, government, and the community.	Per Ongoing Program
Woodside notified BTAC of the planned start date of the activity, again providing information about the activity and requesting any further information on cultural features and/or heritage values prior to a date specified, to be considered in ongoing consultation. PS16.3.1 will be implemented to manage potential impact to newly identified cultural values or features to ALARP and Acceptable Levels.		14 September
<p>In absence of further response from BTAC, Woodside has undertaken desktop research to:</p> <ul style="list-style-type: none"> Identify Indigenous cultural features and heritage values off the WA coastline (Section 4.9.1.5.1) Clarify the extent of Thalanyji sea country (Section 4.9.1.5.3) <p>PS16.3.1 will be implemented to manage potential impact to newly identified cultural values or features to ALARP and Acceptable Levels</p>		-

7.7 Unexpected Finds Procedure

In the event of the discovery of what appears to be Underwater Cultural Heritage (defined as ‘any trace of human existence that has a cultural, historical or archaeological character and is located under water’); the following Unexpected Finds Procedure will apply:

- All activities with the potential to impact the suspected Underwater Cultural Heritage must cease immediately. Retain all records of the potential Underwater Cultural Heritage including any imagery, description and location.
- Person who discovers the heritage object must inform the Activity Supervisor.
- Activity Supervisor must notify Woodside’s Principal Heritage Adviser.
- Woodside will specify an appropriate buffer around the potential Underwater Cultural Heritage, taking into consideration the nature and scale of the potential Underwater Cultural Heritage and the activities to be managed.
- No seabed disturbance may occur within the buffer area around the potential Underwater Cultural Heritage until approved by Woodside’s Principal Heritage Adviser.
- Woodside’s Principal Heritage Adviser must notify a qualified maritime archaeologist and provide all available documentation of the potential Underwater Cultural Heritage.
- If the potential Underwater Cultural Heritage appears to be Aboriginal Underwater Cultural Heritage, Woodside’s Principal Heritage Adviser must notify the appropriate Traditional Custodians to determine whether it is a heritage site and if so, how the site should be managed.
- If the potential Underwater Cultural Heritage appears to be a shipwreck or aircraft that has been wrecked for more than 75 years, or is otherwise reportable under Section 40 of the UCH Act, Woodside’s Principal Heritage Adviser must notify the Minister responsible for the UCH Act, the

DCCEEW underwater archaeological section through the Australasian Underwater Cultural Heritage Database, and the Western Australian Museum.

- If the suspected heritage object includes human remains, Woodside's Principal Heritage Adviser must also notify:
 - the Australian Federal Police (phone: 131 444) of the location of the remains, that the remains are likely to be historic or Aboriginal in origin, and that it may be appropriate that Traditional Custodians and a maritime archaeologist are present during any handling of the remains; and
 - the Office of the Federal Environment Minister in accordance with Section 20 of the ATSIHP Act
- Work must not recommence in the vicinity of the heritage object until Woodside's Principal Heritage Adviser provides written approval. Woodside's Principal Heritage Adviser must only provide written approval once agreed management measures are implemented consistent with approvals and legislation or where the potential Underwater Cultural Heritage is confirmed to not be Underwater Cultural Heritage.

7.8 Training and Competency

7.8.1 Overview

Woodside as part of its contracting process undertakes assessments of a proposed Contractor's environmental management system to determine the level of compliance with the standard AS/NZS ISO 14001. This assessment is undertaken for the Petroleum Activities Program as part of the pre-mobilisation process. The assessment determines whether there is a clearly defined organisational structure that clearly defines the roles and responsibilities for key positions. The assessment also assesses whether there is an up-to-date training matrix that defines any corporate and site/activity-specific environmental training and competency requirements.

As a minimum, environmental awareness during inductions is required for all vessel personnel, detailing awareness and compliance with the project vessel Contractor's environmental policy and environmental management system.

7.8.2 Inductions

Inductions are provided to all relevant personnel (e.g. contractors and Company representatives) before mobilising to or on arrival at the activity location. The induction covers the HSE requirements and environmental information specific to the activity location. Attendance records will be maintained.

The Petroleum Activities Program induction may cover information about:

- Description of the activity.
- Ecological and socio-economic values (including cultural values and heritage) of the activity location.
- Regulations relevant to the activity.
- Woodside's Environmental Management System – Environment and Biodiversity Health, Safety and Environment Policy.
- EP importance/structure/implementation/roles and responsibilities.
- Main environmental aspects/hazards and potential environmental impacts and related performance outcomes.
- Oil spill preparedness and response.

- Monitoring and reporting on performance outcomes and standards using MC.
- Incident reporting.

In addition, the inductions will cover the requirement that there will be no recreational fishing from vessels.

7.8.3 Activities Program Specific Environmental Awareness

Before petroleum activities begin, a pre-activity meeting will be held on-board the project vessels with all relevant personnel. The pre-activity meeting provides an opportunity to reiterate specific environmental sensitivities or commitments associated with the activity. Attendance lists are recorded and retained. Relevant sections of the pre-activity meeting will also be communicated through to the support vessel personnel. Attendance lists are recorded and retained.

During operations, regular HSE meetings will be held on the project vessels which cover all crew. During these meetings, recent environmental incidents are regularly reviewed, and awareness material presented.

7.8.4 Marine Fauna Observation Training

The Marine Fauna Observer (MFO) role may be completed by vessel crew who are appropriately trained prior to the activity commencing. For those performing the MFO role in the Pygmy Blue Whale migratory BIA and Distribution Range in particular, training will include information specific to PBW identification. Requirements for an MFO / triggers are outlined in Section 6.7.6 and summarised in Table 7-6.

Woodside and Contractor personnel will be trained to deliver the MFO training ('train-the-trainer' model) by an external organisation specialising in marine environmental training, with expertise in marine fauna observations. Training materials will be developed by the external organisation in consultation with Woodside, to ensure Project specific information is incorporated. The bespoke training package will cover:

- An overview of Scarborough Project activities and the marine megafauna that may be present during these activities
- An overview of the potential impacts and risks to marine megafauna, including pygmy blue whales
- An overview of marine megafauna that may be present during activities.
- An overview of EP controls and management procedures relevant to marine megafauna (including PBW) presence
- Precautionary approach to identification i.e. assume pygmy blue whale if positive ID of different species type not possible;
- The role and responsibilities of MFOs
- The observation and reporting requirements (Section 7.17).
- When trained crew are undertaking observations, expectations are that:
- Observation equipment / tools are used as required (i.e. range-finding binoculars, marine megafauna ID prompts etc.)
- Escalation process carried out if cetaceans / pygmy blue whales are identified to allow for implementation of adaptive management as required by controls throughout EP
- Make and maintain records including the date, time and approximate distance from the vessel, and the action taken to comply with EPS

- An overview of the potential impacts to protected marine fauna.

Records will be maintained as evidence of the vessel crew who have completed the MFO training. Completion of MFO Training (focusing on pygmy blue whales (PBWs)) is a minimum requirement for those performing observations relevant to PBW mitigation/adaptive management measures in this EP. For any trained crew who have not conducted MFO training for greater than 12 months, refresher training is required prior to undertaking the role.

Training and competency is informed by a competency framework and tracked by a contractor MFO Coordinator who assures appropriate competency of trained vessel crew prior to them being allowed to perform MFO duties.

Table 7-6: Vessel noise management controls and MFO requirements summary – risk-based hierarchy

PBW spatial management areas	PBW temporal management periods		
	Peak Northbound Migration (May/June)	Migration Season (April – Jul & Oct – Jan)	Outside PBW Migration Season (Feb/Mar & Aug/Sept)
KP 200-374 (Migration BIA)	Trained vessel crew making observations if they see something as part of usual duties (C6.2) Second B-type on DP within 25km of C1 – Not allowed (PS 6.5.1)		Trained vessel crew making observations if they see something as part of usual duties (C6.2) MFO to make dedicated continuous observations 60 mins prior to second B-type arrival (PS 6.5.2)
KP 180-200 + KP 374-430 (Distribution Area)	Trained vessel crew making observations if they see something as part of usual duties (C6.2) Second B-type on DP within 25km of C1 – Not allowed (PS 6.5.1)	Trained vessel crew making observations if they see something as part of usual duties (C6.2) MFO to make dedicated continuous observations 60 mins prior to second B-type arrival (PS 6.5.2) Second B-type on DP within 25km of C1 – Day - only allowed if no PBW (certain or possible) sighted by MFO during 60 mins preceding arrival Night – only allowed if no PBW sighted by Trained Vessel Crew in preceding day-light period	Second B-type on DP within 25km of C1 – Day - only allowed if no PBW (certain or possible) sighted by MFO during 60 mins preceding arrival Night – only allowed if no PBW sighted by Trained Vessel Crew in preceding day-light period
KP 30-180 (NWS and inshore Distribution Range)	Trained vessel crew making observations if they see something as part of usual duties (C6.2) No additional controls		

Definitions:

Migration BIA – ~KP 200 – KP 374

Distribution Area – West of the Migration BIA & 20 km east of the BIA (i.e., from KP 180 - KP 200 and KP 374 – PLET at KP 430).

Note – this area (defined for the Scarborough SITI activities) is a subset of the broader PBW Distribution Range which extends to mainland Australia (refer to the Blue Whale Conservation Management Plan (Commonwealth of Australia, 2015))

Migration Seasons – April to July (Northbound) & Oct to Jan (Southbound)

Peak Migration Seasons – May/June (Northbound) & Nov (Southbound)

Trained Vessel Crew - A suitably trained person who can make observations of fauna as part of their usual vessel activities (i.e captain, first officer, bridge crew)

Marine Fauna Observer (MFO) - A dedicated and suitably trained person (can be vessel crew) who must not have any other duties that impede their ability to engage in visual observations for marine fauna.

7.8.5 Management of Training Requirements

All personnel on the project vessels are required to be competent to perform their assigned positions. This may be in the form of external or 'on the job' training. The vessel Safety Training Coordinator (or equivalent) is responsible for identifying training needs, keeping records of training performed and identifying minimum training requirements.

7.9 Monitoring

Woodside and its contractors will perform a program of periodic monitoring during the Petroleum Activities Program – starting at mobilisation of each activity and continuing through the duration of each activity to activity completion. This information will be collected using the tools and systems outlined below, developed based on the EPOs, controls, standards and MC in this EP. The tools and systems will collect, as a minimum, the data (evidence) referred to in the MC in Section 6 and Appendix D.

The collection of this data (against the MC) will form part of the permanent record of compliance maintained by Woodside and will form the basis for demonstrating that the EPOs and standards are met, which will be summarised in a series of routine reporting documents.

7.9.1 Source-based Impacts and Risks

The tools and systems to monitor environmental performance, where relevant, will include:

- Daily reports which include leading indicator compliance.
- Periodic review of waste management and recycling records.
- Use of contractor's risk identification program that requires recording and submitting safety and environment risk observation cards routinely (frequency varies with contractor).
- Collection of evidence of compliance with the controls detailed in the EP relevant to offshore activities
- Environmental discharge reports that record volumes of planned and unplanned discharges, to ocean and atmosphere.
- Internal auditing and assurance program as described in Section 7.10.

Throughout this activity, Woodside will continuously identify new source-based risks and impacts through the Monitoring and Auditing systems and tools described above and in Section 7.10.

7.9.2 Management of Knowledge

Review of knowledge relevant to the existing environment is undertaken in order to identify changes relating to the understanding of the environment or legislation that supports the risk and impact assessments for EPs (in-force and in-preparation). Relevant knowledge is defined as:

- Environmental science supporting the description of the existing environment.
- Socio-economic environment and stakeholder information.
- Environmental legislation.

The frequency and documentation of reviews, communication of relevant new knowledge and consideration of management of change are documented in the WMS Environment Plan Guideline.

In addition, Section 7.5 detail the process for the Heritage Management Committee to assess new information. Any relevant new information on cultural values and heritage will be assessed using the EP Management of Change Process (refer to Section 7.15).

Under the Oil Spill Scientific Monitoring Program preparedness, an annual review and update to the environmental baseline studies database is completed and documented. Periodic location-focused environmental studies and baseline data gap analyses are completed and documented. Any subsequent studies scoped and executed as a result of such gap analysis are managed by the Environment Science Team and tracked via the Corporate Environment Baseline Database.

7.10 Tiered Monitoring and Management Framework

The tiered monitoring and management framework (TMMF) is a proactive and adaptive framework informed by water quality to manage the dredging activities such that impacts to benthic communities and habitats (BCH) are not realised through its implementation. The TMMF aims to manage TSHD trenching and spoil disposal, and borrow ground dredging and backfill activities within acceptable water quality boundaries, to avoid reversible impacts to coral communities as the most sensitive receptor in Ecological Zone A and B and sponges in the Offshore Zone (see description in Section 6.7.2). An overview of the TMMF is provided below with the details set out in the Scarborough Project Dredging and Spoil Disposal Management Plan⁵⁴, which has been approved by the CEO of DWER under Condition 6 of Ministerial Statement No.1172 approved under the Environmental Protection Act 1986 (WA). Details pertinent to State waters scope are subject to change with any changes to be approved by the CEO, and implemented.

7.10.1 Tiered trigger levels and process

An overview of the management triggers are provided in Table 7-7.

The management triggers have been derived from the same dataset and literature as the modelling thresholds (see Appendix I), however have been applied conservatively, with the Tier 3 management trigger aligned with the ZoMI threshold (i.e. reversible impacts).

In Commonwealth waters, the triggers are for sponges and filter feeders, as corals, seagrasses and macroalgae are not known to form significant communities in the zone. Filter feeder-sponge thresholds and associated management triggers have been adapted from Pineda et al. (2017). Zone B management triggers have also been included acknowledging there is a potential impact pathway from Commonwealth activities to influence benthic communities in State waters. These triggers were derived for corals as the most sensitive receptor from Jones et al (2019).

Table 7-7: Tiered management trigger levels (as relevant to Commonwealth activities)

Trigger	Averaging Period	Trigger (NTU)	DLI (mol/d)
Offshore Zone			
Tier 1	22 days	>11.25	<0.9
Tier 2	26 days	>11.25	<0.9
Tier 3	28 days	>11.25	<0.9
Zone B			
Tier 1	1 days	>10.5	<1.8
	4 days	>9.36	<2.2
	8 days	>8.36	<2.5
Tier 2	1 days	>13.86	<1.1
	5 days	>10.5	<1.8
	8 days	>9.36	<2.2
	12 days	>8.36	<2.5

⁵⁴ available online [Scarborough Project \(Nearshore Component\) Dredging and Spoil Disposal Management Plan](#)

Trigger	Averaging Period	Trigger (NTU)	DLI (mol/d)
Tier 3	3 days	>13.86	<1.1
	7 days	>10.5	<1.8
	10 days	>9.36	<2.2
	14 days	>8.36	<2.5

The assessment of monitoring data against the tiered management triggers comprises two key aspects:

- The comparison of measured data against the turbidity and DLI numeric values over a defined time period. Note it is the combined effects (EPA 2021b) so both NTU and DLI values are required to be exceeded to move onto Step 2.
- The exceedance of a numeric value for turbidity and daily light integral (DLI) over a defined averaging time period
- A Project attributability assessment to determine if trenching and spoil disposal or borrow ground dredging and backfill activities can reasonably be expected to have contributed to or caused the exceedance.

Both parts of the assessment are required before it can be determined that an exceedance of a management trigger has occurred. For example, if the both the NTU and DLI values are exceeded over the defined time period but the attributability assessment indicates that the breach is not attributable to Project activities, then the determination is the trigger level has not been exceeded.

7.10.1.1 Project attributability assessment

When a tiered management trigger is exceeded, the initial response is to investigate the cause of the exceedance and whether or not the detected change can be reasonably attributed to dredging (trenching or borrow ground), spoil disposal or backfill activities, rather than a result of an anomalous reading or a natural event or an external anthropogenic event. This approach ensures that adaptive management actions are targeted to improving water quality and that the program can be completed effectively within the proposed timeframes.

There are two key steps for assessing project attributability; assessment of data reliability and evaluation of multiple lines of evidence, including but not limited to weather and oceanographic conditions, site specific and regional water quality data, nature of recent dredging activities and experimental evidence. The attributability assessment will be documented and appropriately conservative based on the evidence available.

7.10.1.2 Adaptive management actions

In the event that an exceedance is found to be attributable to trenching and spoil disposal or borrow ground dredging and backfill activities, the appropriate actions will be identified and initiated as per the TMMF illustrated in Figure 7-3. For a Tier 2 and Tier 3 management trigger exceedances, this includes the identification and execution of appropriate responsive or contingency management actions respectively.

7.10.1.2.1 Responsive management actions

Responsive management actions will be implemented when a Project-attributable Tier 2 exceedance has occurred. There are a range of options that are considered practical to reduce the mass of sediment released during trenching and spoil disposal or borrow ground dredging and backfill activities. These may include (Netzband et al., 2009):

- Adjust the suction flow velocity.
- Adjust the jet water flow velocity.

- Alter the overflow time of the TSHD.
- Adjust the overflow height.
- Adjust the TSHD trailing speed.
- Modify the rate of operations.
- Adjust sailing speed of barges (propeller wash).
- Optimise the timing and spacing of dredge activities.
- Optimise disposal location within spoil disposal ground.
- Relocate TSHD.

The selection of management action/s will consider the context of the dredging operation at the time (such as location, tides, water depth). Not all options will have similar effect in all circumstances and locations; therefore, any option implemented will require evaluation and subsequent modification where appropriate. The applicability and effectiveness of management actions will be assessed and rationalised by the Dredging Contractor in consultation with, and approved by Woodside, before implementation.

Water quality will continue to be monitored after Tier 2 trigger exceedance to assess whether the adopted management actions have been effective in improving water quality. Responsive management action/s can only cease (return to normal operations) once turbidity returns below the Tier 2 trigger or once superseded by implementing more effective management action/s.

7.10.1.2.2 Contingency management actions

Contingency management actions will be applied when a Project-attributable Tier 3 exceedance has occurred. Contingency management actions are those known to markedly reduce the loss of fines sediment released during dredging activities. These may include (Netzband et al., 2009):

- Relocate TSHD.
- Optimise the spacing and timing of dredge activities.
- Temporarily cease overflow on the TSHD.
- Tidal operations for BHD and/or TSHD and/or all equipment.
- Production limit for BHD and/or TSHD and/or all equipment
- Temporarily suspend operations of BHD and/or TSHD.
- Temporarily suspend all dredging operations.

The applicability and effectiveness of management actions will be assessed and rationalised by the Dredging Contractor in consultation with, and approved by Woodside, before implementation. Water quality will continue to be monitored after Tier 3 trigger exceedance to assess whether the adopted management actions have been effective in improving water quality. Contingency management action/s can only cease (return to normal operations) once water quality returns to below the Tier 2 turbidity trigger.

An overview of the management framework is presented in Figure 7-3.

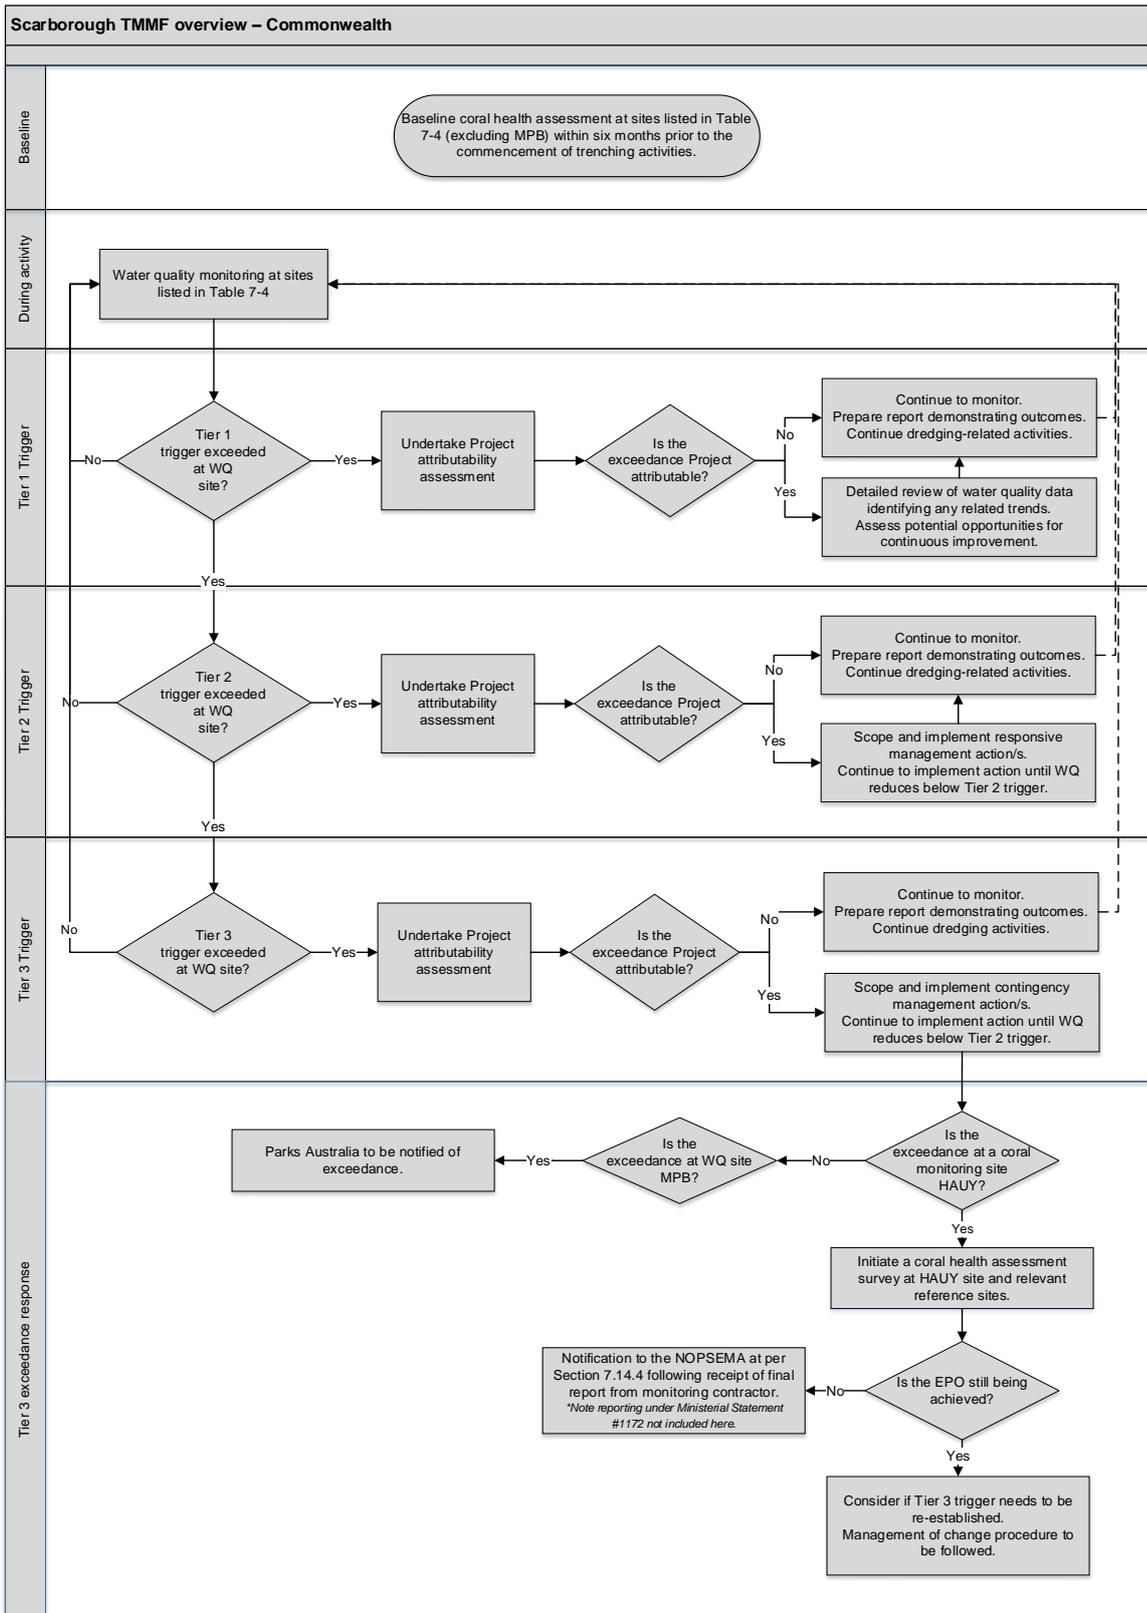

Figure 7-3: Tiered monitoring and management framework overview

7.10.2 Water quality monitoring

Monitoring sites have been selected based on dredge plume modelling outcomes from a suite of pre-existing Pluto LNG Foundation project monitoring locations (where possible). This means in most instances, long term baseline datasets are available to inform the monitoring programs for both water quality and coral community.

Table 7-8 provides a list of the full suite of monitoring sites across both Commonwealth and State activities, with those sites which have particular relevance to the Commonwealth scope detailed within. The Marine Park Boundary monitoring site (MPB) has been selected to ensure that water quality levels within the Dampier Marine Park are managed to a level at which impacts are not predicted to occur to sponge and filter feeder communities (Table 7-7:). This site has been selected given the marine park values, however the management of water quality to the levels outlined in Table 7-7: is considered to be conservative a given that benthic communities where the Zol overlaps the Marine Park are sparse.

The monitoring sites have been classified as follows:

- **Impact sites:** are reactive monitoring sites where modelling shows there is an intersection of the ZoMI with significant coral habitat (or directly adjacent to). Impact sites include turbidity and light triggers that, if exceeded and are attributable to trenching and spoil disposal, or borrow ground dredging and backfill activities, initiate data review and responsive or contingency management action/s (as applicable to level).
- **Influence sites:** are reactive monitoring sites where modelling shows there is an intersection of the Zol with significant coral habitat or sponge communities (for Dampier Marine Park boundary site). A conservative approach has been taken by categorising sites that fall just outside of the Zol (within 200m of the boundary) as Influence sites.
- These sites may be classified as reference sites where it can be demonstrated they have not been influenced by the dredging plume. Conversely, they may be classed as impact sites if the Tier 2 management trigger is exceeded and attributed to the Project.
- **Reference sites:** are representative sites which are not predicted to be impacted or influenced by the sediment plume. These sites are designed to provide contextual information to inform the assessment of water quality trends and more specifically provide information to support project attributability assessments. Data from these locations will be used, where appropriate, to assess project attributability of tiered trigger exceedances and coral community effects if required.
- **Informative sites** (water quality only): are sites that are predicted to be influenced or impacted by the sediment plume from one activity, however well removed from the other activity (i.e., influenced from trenching and spoil disposal or borrow ground dredging and backfill). Data from these locations will be used, where appropriate, to assess project attributability of coral community effects if required. These sites will not be reactively managed.

The water quality monitoring sites shown in Figure 7-4 and Figure 7-5 will be in place for the duration of the relevant activity (trenching and spoil disposal or borrow ground dredging and backfill activities) providing spatial coverage of areas potentially affected at all times. Note, elevations in turbidity associated with the activity are expected to be spatially confined, extending only to a small portion of the total Zol at any point in time, given the rapid progress of the activity along the trunkline route.

Table 7-8: Water quality monitoring sites and relevance to Commonwealth activities

Site	Ecological zone	Approximate Coordinates ⁵⁵		Relevance to Commonwealth activities
		Easting	Northing	Not relevant (NR)
CONI	B	476808	7729505	NR

The water quality monitoring program relies on near real-time measurements of turbidity and photosynthetic active radiation (PAR), the latter as a measure of daily light integral (DLI). Turbidity and light will be measured at a depth that is most reflective of the conditions which receptors are experiencing. These instrument will be programmed to record every 30 minutes to provide an early insight into the deterioration of water quality (natural or project related). For the light sensors, they will likely be programmed to not record between 20:30 and 03:30 as no light is available between this period and battery and data usage could therefore be optimised. Turbidity and light data will be telemetered at appropriate frequencies to a host website where water quality data can be compared against the tiered trigger levels.

Water quality instruments will be calibrated and maintained in accordance with the manufacturer's recommendations. It is anticipated that during the campaign, there is likely to be some minor loss of data due to equipment failure or fouling. To address this, there will be a maintenance schedule with all instruments systematically retrieved, downloaded, cleaned and redeployed/replaced (as necessary) to maintain the data quality and ensure a high percentage of data collection.

Routine servicing of the water quality monitoring instruments is expected to occur every six to eight weeks to ensure good data quality and minimise the risk of data loss, although this period may be reduced or extended based on the data recorded. An adequate number of replacement instruments will be available where required.

Once collected, all data will be subject to rigorous quality assurance and quality control procedures. Before analysis and use of data in a management trigger assessment, its integrity will be checked and anomalous data will be removed from the dataset in accordance with the best practice methods (such as Jones et al., 2015b; Jones et al., 2016).

The analysis of water quality parameters will use best practice summary statistics and analysis techniques based on outcomes from the WAMSI dredging science node studies, where applicable (e.g., Jones et al. 2015b, Jones et al. 2016). For comparison against tiered trigger levels the following will be calculated.

- PAR: DLI (derived from PAR) and DLI running means (as per durations set out in Table 7-7). Note depending on the depth of the water quality site relevant to depth of the adjacent coral communities, the DLI data may be adjusted to account for the difference.
- Turbidity: NTU and NTU running means (as per durations set out in Table 7-7)

7.10.3 Coral community assessment

The objective of the coral community assessment is to provide data that will assist in confirming no detectable net reduction of live coral cover at any of the coral impact monitoring locations attributable to the proposal.

Coral community assessment surveys are proposed within six months before commencing trenching and spoil disposal activities; a reactive survey at the affected site (and associated reference sites) in the event of a project attributable Tier 3 management trigger exceedance; and a post-dredging survey within three months post completion of backfill activities.

The monitoring program has been designed to detect net changes in live coral cover at impact monitoring sites, which are significantly different from natural changes occurring concurrently at reference sites. The statistical design has considered how much coral cover changes naturally from time to time and how that varies among different sites.

A power analysis was completed for testing for a change in coral cover (Δ Coral Cover) along each transect between two periods (Before and After) then comparing the average of those transect changes at the impact site against the average across reference sites. Using fixed transects the program has been designed to detect lower absolute changes at an effect size of 13% at an

appropriate level of power (0.8). The proposed monitoring design is based on eight reference sites, and the collection of five fixed ten meter transects at each monitoring site, before and after dredging.

Cover will be estimated for each transect by scoring a set of 30 points applied in a stratified random design to each of the recorded images.

To determine whether there has been a detectable reduction of net live coral cover at impact sites and whether or not project activities are reasonably considered to have caused or contributed to the impact a number of steps will be performed. This includes a One-sided F-test to test if net loss at impact site is significantly greater than changes at reference sites, in addition to a Project attributability assessment.

Where an investigation demonstrates that there has been detectable net reduction of live coral cover at a coral impact monitoring location attributable to the Petroleum Activities Program in Commonwealth waters, NOPSEMA will be notified as per Section 7.17.4.

7.10.4 Dredge plume assessment study

A dredge plume assessment study is proposed for the TSHD borrow ground dredging activities. The objectives of the dredge plume assessment is to determine the distance from the TSHD at which turbidity associated with the borrow ground dredging activities returns to background levels; and to validate the dredge plume modelling related to TSHD sediment losses.

Data collection is proposed to be undertaken on a representative day during a spring tidal cycle to capture the greatest plume extent.

To confirm the prevailing surface currents and thus the expected trajectory of the dredge plume, a drifter buoy (or similar) will be deployed prior to commencement of sampling. Once the prevailing current has been determined, sampling will be completed to determine the background turbidity levels upstream. This will consist of three turbidity casts at representative locations upstream, and well removed from the activity. Casts of the water column will be completed using a calibrated multiparameter instrument with turbidity and depth sensors (or similar such as acoustic doppler current profiler (ADCP)).

To determine the spatial extent of the dredge plume under representative conditions, water quality profiles will then be collected downstream along three transects radiating out from the TSHD (while dredging) with casts completed approximately every 100 m. Transect 1 aligns with the direction of the dominant current (as determined by the drifter buoy (or similar)) downstream of the TSHD. Transects 2 and 3 should be completed at around 45 degrees from the prevailing current. For transects 1 to 3, water quality profiler casts will continue along the pre-determined bearing from the TSHD until water quality is observed to return to background levels.

To establish a site-specific NTU-TSS relationship and allow TSS measurements to be directly related to turbidity profiles, TSS water samples will also be collected at multiple depths. If an ADCP is being used to infer turbidity instead of a through-water sensor cast, TSS data will be used to calibrate the backscatter signals.

To confirm the appropriateness of the model prediction, a hindcast model run will be completed based on the dredging activity at the time, as well as prevailing metocean conditions. The outputs of the hindcast model results will then be compared to the measured in field turbidity data (converted to SSC mg/L) to verify the validity of the assumptions made in the simulations of TSHD sediment losses.

If dredge plume assessment outcomes suggest that predictive modelling significantly underestimated the plume extent from borrow ground dredging activities, then a desktop assessment will be undertaken to assess the potential risk to nearby receptors such as corals at Madeleine Shoals. This assessment will consider the results of the dredge plume assessment outcomes, nearby site-specific water quality monitoring and where appropriate remote sensing imagery. In the

event that sensitive receptors (such as corals at Madeleine Shoals) are considered at risk of elevated turbidity from borrow ground dredging activities (i.e., above relevant thresholds), adaptive management actions (see Section 7.10.1.2) will be considered to minimise the risk.

7.11 Management of Marine Fauna

During daylight hours, trained vessel crew onboard the TSHD will visually assess marine fauna and the following observation and exclusion zones will be adhered to during operation of the TSHD and during disposal of material at the spoil grounds:

- whales: observation zone 300 m; exclusion zone 100 m
- dolphins: observation zone 150 m (except for spoil disposal operations where the observation zone is 300m); exclusion zone 50 m
- dugongs: observation zone 150 m (except for spoil disposal operations where the observation zone is 300m); exclusion zone 50 m
- turtles and sea snakes: observation zone 100 m (except for spoil disposal operations where the observation zone is 300 m); exclusion zone 50 m.

If marine fauna is observed at the spoil grounds, the vessel must move 300 m or more away from the marine fauna before commencing dumping operations.

During transit to and from the spoil grounds or borrow ground, vessels (including the TSHD and split hopper barges) will operate in accordance with EPBC Regulations 2000 – Part 8 Division 8.1.

Figure 7-6 outlines the marine fauna management procedure during dredging.

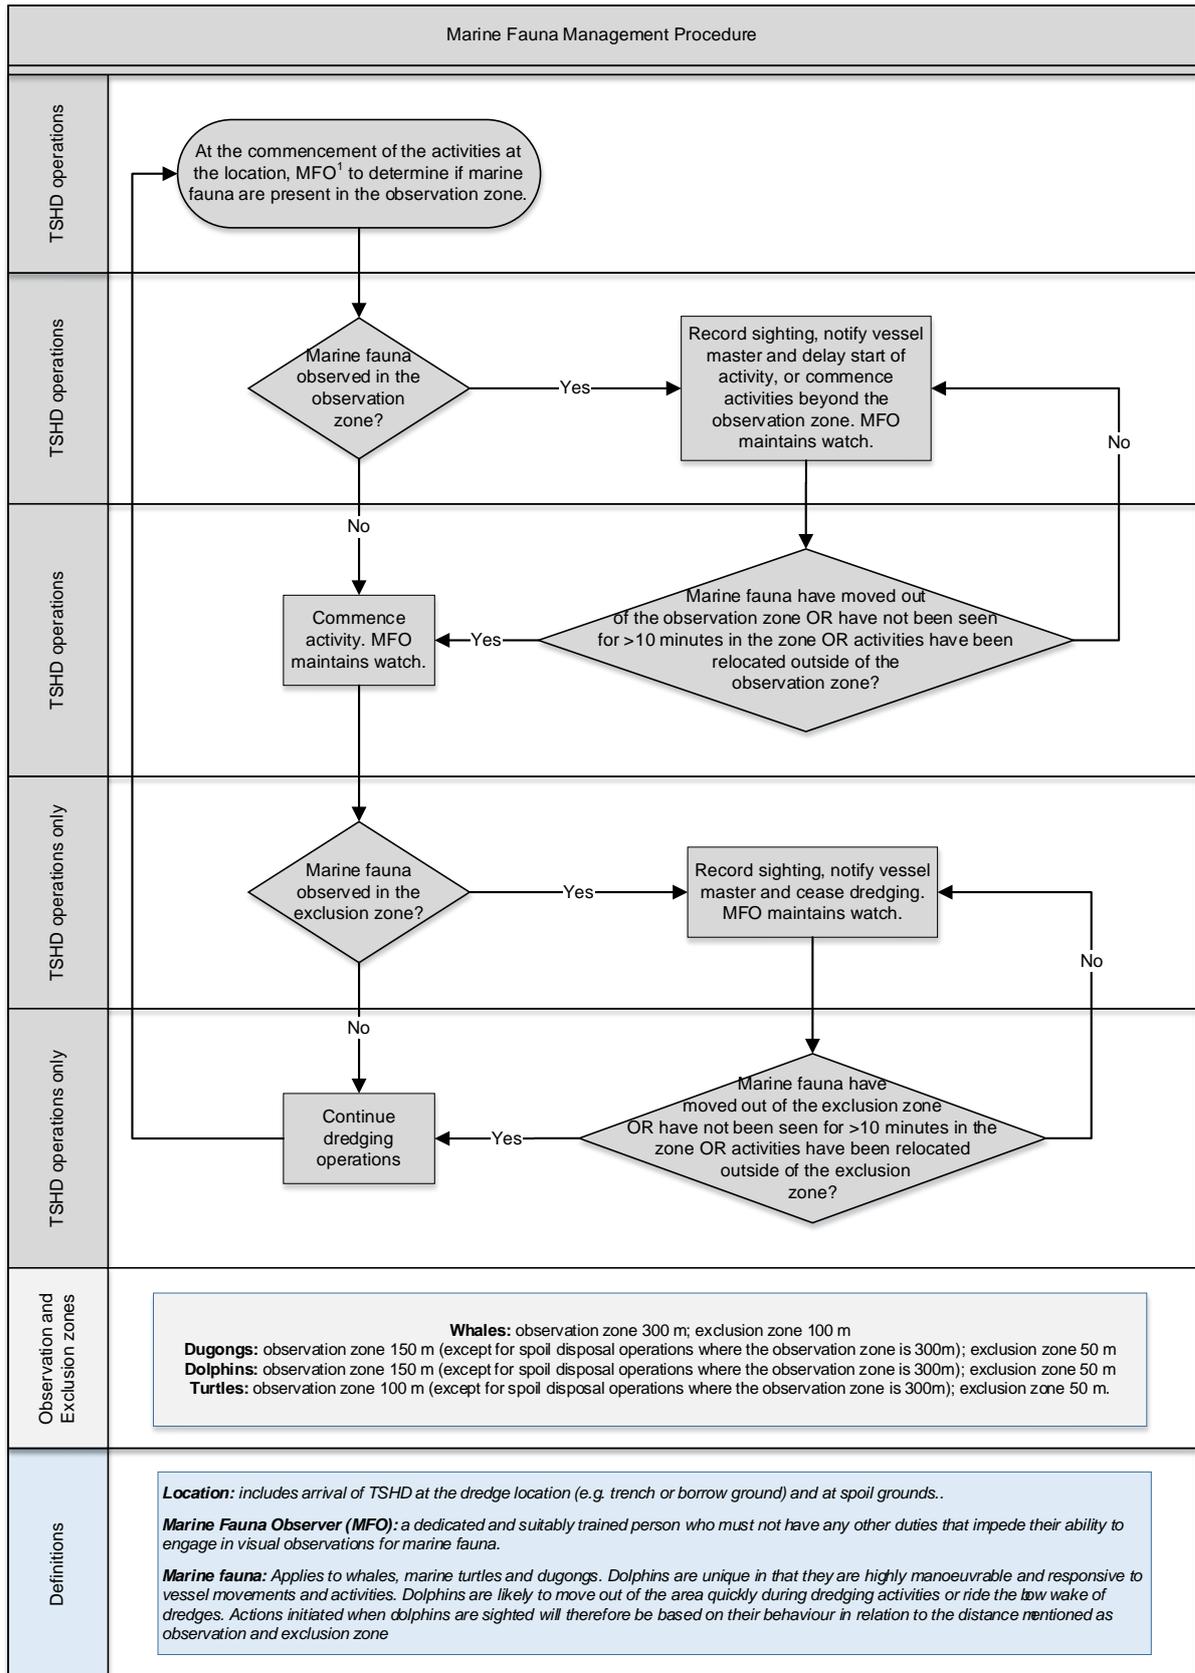

Figure 7-6: Marine fauna management procedure during TSHD operations

7.12 Auditing

Environmental performance auditing will be performed to:

- Identify potential new or changes to existing environmental impacts and risk, and methods for reducing those to ALARP.
- Confirm that mitigation measures detailed in this EP are effectively reducing environmental impacts and risk, that mitigation measures proposed are practicable and provide appropriate information to verify compliance.
- Confirm compliance with the Performance Outcomes, Controls and Standards detailed in this EP.
- Internal auditing will be performed to cover each key project activity as summarised below.

7.12.1 Subsea Installation Activities

The following internal auditing will be performed for the subsea scope activities:

- Pre-mobilisation inspection/audit report will be conducted by a relevant person (before commencing). The scope of the audits are risk-based and specific to the relevant activity, but will generally focus on aspects relating to ensuring appropriate understanding of environmental commitments and the operational readiness of the activity scope, including appropriate environmental controls in place. All primary installation vessels associated with the seabed intervention and trunkline installation activities will be audited by Woodside. Support or transport vessels will be assessed on a risk-based approach, but will be audited via the contractor's process.
- At least one operational compliance audit relevant to applicable EP commitments will be conducted by a Woodside Environment Adviser for the seabed intervention and trunkline installation activities. The audit may be conducted offshore or office-based, subject to the duration of the activity and logistics of performing the audit offshore for short duration scopes.
- Contractor-specific HSE audits will also be conducted of the associated support vessels. The audits will consider the implementation of HSE management, risk management, as well as pre-mobilisation and offshore readiness.
- Vessel based HSE inspections will be conducted fortnightly by vessel HSE personnel. Each inspection will focus on a specific risk area relevant to the project activity and a formal report will be issued (for example, bunkering controls, chemical and discharge management, cetacean reporting, etc).

The internal audits and reviews, combined with the ongoing monitoring described in Section 7.9, and collection of evidence for MC are used to assess EPOs and standards.

As part of Woodside's EMS and/or assurances processes, activities may also be periodically selected for environmental audits as per Woodside's internal auditing process. Audit, inspection and review findings relevant to continuous improvement of environmental performance are tracked through the Environmental Commitments and Actions Register.

This Environmental Commitments and Actions Register is used to track subsea support vessel and subsea activity compliance with EP commitments, including any findings and corrective actions.

Non-conformances identified will be reported and/or tracked in accordance with Section 7.13.

7.12.2 Marine Assurance

All vessels are subject to the Marine Offshore Assurance process and review of the Offshore Vessel Inspection Database (OVID). All required audits and inspections will assess compliance with the

laws of the international shipping industry, which includes safety and environmental management requirements, and maritime legislation including International Convention for the Prevention of Pollution from Ships 1973, as modified by the Protocol of 1978 (MARPOL) and other International Maritime Organization (IMO) standards.

Woodside's marine assurance is managed by the Marine Assurance Team of the Logistics Function in accordance with Woodside's Marine Offshore Vessel Assurance Procedure. The Woodside process is based on industry standards and consideration of guidelines and recommendations from recognised industry organisations such as Oil Companies International Marine Forum and International Maritime Contractors Association.

Woodside's Marine Offshore Assurance process is mandatory for all vessels (other than Tankers and Floating Production Storage and Offloading vessels) that are chartered directly by or on behalf of Woodside, including for short term hires (i.e. <3 months in duration). It defines applicable marine offshore assurance activities, ensuring all vessel operators operate seaworthy vessels that meet the requirements for a defined scope of work and are managed with a robust Safety Management System.

The process is multi-faceted and encompasses the following marine assurance activities:

- Safety Management System Assessment.
- Dynamic Positioning (DP) System Verification.
- Vessel Inspections.
- Project support for tender review, evaluation and pre/post contract award.

Vessel inspections are used to verify actual levels of compliance with the company's Safety Management System, the overall condition of the vessel and the status of the planned maintenance system onboard. Woodside Marine Assurance Specialist will conduct a risk assessment on the vessel to determine the level of assurance applied and the type of vessel inspection required.

Methods of vessel inspection may include, and are not limited to:

- Woodside Marine Vessel Inspection
- OCIMF OVID Inspection
- IMCA CMID Inspection
- Marine Warranty Survey

Upon completion of the marine assurance process, to confirm that identified concerns are addressed appropriately and conditions imposed are managed, the Woodside Marine Assurance Team will issue the vessel a statement of approval. Should a vessel not meet the requirements of the Woodside Marine Offshore Vessel Assurance Process and be rejected, there does exist an opportunity to further scrutinise the proposed vessel.

Where a vessel inspection and/or OVMSA Verification Review is not available and all reasonable efforts based on time and resource availability to complete an vessel inspection and/or OVMSA Verification Review are performed (i.e. short term vessel hire), the Marine Assurance Specialist Offshore may approve the use of an alternate means of inspection, known as a risk assessment.

7.12.3 Risk Assessment

Woodside conducts a risk assessment of vessels where either an OVMSA Verification Review and/or vessel inspection cannot be completed. This is not a regular occurrence and is typically used when the requirements of the assurance process are unable to be met or the processes detailed are not applicable to a proposed vessel(s). The Marine Vessel Risk Assessment will be conducted by the Marine Assurance Specialist, where the vessel meets the short term hire prerequisites.

The risk assessment is a semi-quantitative method of determining what further assurance process activity, if any, is required to assure a vessel for a particular task or role. The process compares the level of management control a vessel is subject to against the risk factors associated with the activity or role.

Several factors are assessed as part of a vessel risk assessment, including:

- Management control factors:
 - Company audit score (i.e. management system)
 - vessel HSE incidents
 - vessel Port State Control deficiencies
 - instances of Port State Control vessel detainment
 - years since previous satisfactory vessel inspection
 - age of vessel
 - contractors' prior experience operating for Woodside.
- Activity risk factors:
 - people health and safety risks (a function of the nature of the work and the area of operation)
 - environmental risks (a function of environmental sensitivity, activity type and magnitude of potential environment damage (e.g. largest credible oil spill scenario))
 - value risk (likely time and cost consequence to Woodside if the vessel becomes unusable)
 - reputation risk
 - exposure (i.e. exposure to risk based on duration of project)
 - industrial relations risk.

The acceptability of the vessel or requirement for further vessel inspections or audits is based on the ratio of vessel score to activity risk. If the vessel management control is not deemed to appropriately manage activity risk, a satisfactory company audit and/or vessel inspection may be required before awarding work.

The risk assessment is valid for the period a vessel is on hire and for the defined scope of work.

7.13 Management of Non-conformance

Woodside classifies non-conformances with EPOs and standards in this EP as environmental incidents. Woodside employees and contractors are required to report all environmental incidents, and these are managed as per Woodside's internal event recording, investigation and learning requirements.

An internal computerised database called First Priority is used to record and report these incidents. Details of the event, immediate action taken to control the situation, investigation outcomes and corrective actions to prevent reoccurrence are all recorded. Corrective actions are monitored using First Priority and closed out in a timely manner.

Woodside uses a consequence matrix for classification of environmental incidents, with the significant categories being A, B and C (as detailed in Section 6). Detailed investigations are completed for all categories A, B, C and high potential environmental incidents.

7.14 Review

7.14.1 Management Review

Within the Environment Function, senior management regularly monitor and review environmental performance and the effectiveness of managing environmental risks and performance. Within each Function and Business Unit Leadership Team (e.g. seabed intervention and trunkline installation), managers review environmental performance regularly, including through quarterly HSE review meetings.

Woodside Environment Team will perform six-monthly reviews of the effectiveness of the implementation strategy and associated tools. This will involve reviewing the:

- Seabed intervention and trunkline installation activities environment KPIs (leading and lagging).
- Tools and systems to monitor environmental performance (detailed in Section 7.9)
- Lessons learned about implementation tools and throughout each campaign.

Reviews of oil spill arrangements and testing are performed in accordance with Section 7.19.

7.14.2 Learning and Knowledge Sharing

Learning and knowledge sharing occurs via a number of different methods including:

- Event investigations.
- Event bulletins.
- After action review conducted, including review of environmental incidents as relevant.
- Ongoing communication with project vessel operators.
- Formal and informal industry benchmarking.
- Cross asset learnings.
- Engineering and technical authorities discipline communications and sharing.

7.14.3 Review of Impacts, Risks and Controls Across the Life of the EP

In the unlikely case that activities described in this EP do not occur continuously or sequentially, before recommencing activities after a cessation period greater than 12 months, impacts, risks and controls will be reviewed.

The process will identify or review impacts and risks associated with the newly-commencing activity, and will identify or review controls to ensure impacts and risks remain/are reduced to ALARP and acceptable levels. Information learned from previous activities conducted under this EP will be considered. Controls which have previously been excluded on the basis of proportionality will be reconsidered. Any required changes will be managed by the MOC process outlined below (Section 7.15).

7.15 Management of Change and Revision

7.15.1 EP Management of Change

Management of changes are managed in accordance with Woodside's Environmental Approval Requirements Australia Commonwealth Guideline. Management of changes relevant to this EP, concerning the scope of the activity description (Section 3) including: review of advances in technology at stages where new equipment may be selected such as vessel contracting; changes in understanding of the environment, DAWE EPBC Act listed threatened and migratory species

status, Part 13 statutory instruments (recovery plans, threat abatement plans, conservation advice, wildlife conservation plans) and current requirements for AMPs (Section 4); and potential new advice from external stakeholders (Section 5), will be managed in accordance with Regulation 17 of the Environment Regulations.

Risk will be assessed in accordance with the environmental risk management methodology (Section 2.3) to determine the significance of any potential new environmental impacts or risks not provided for in this EP. Risk assessment outcomes are reviewed in compliance with Regulation 17 of the Environment Regulations.

Minor changes where a review of the activity and the environmental risks and impacts of the activity do not trigger a requirement for a formal revision under Regulation 17 of the Environment Regulations, will be considered a 'minor revision'. Minor administrative changes to this EP, where an assessment of the environmental risks and impacts is not required (e.g. document references, phone numbers, etc.), will also be considered a 'minor revision'. Minor revisions as defined above will be made to this EP using Woodside's document control process. Minor revisions will be tracked in an MOC Register to ensure visibility of cumulative risk changes, as well as enable internal EP updates/reissuing as required. This document will be made available to NOPSEMA during regulator environment inspections.

7.15.2 OPEP Management of Change

Relevant documents from the OPEP will be reviewed in the following circumstances:

- Implementation of improved preparedness measures.
- A change in the availability of equipment stockpiles.
- A change in the availability of personnel that reduces or improves preparedness and the capacity to respond.
- The introduction of a new or improved technology that may be considered in a response for this activity.
- To incorporate, where relevant, lessons learned from exercises or events.
- If national or state response frameworks and Woodside's integration with these frameworks changes.

Where changes are required to the OPEP, based on the outcomes of the reviews described above, they will be assessed against Regulation 17 to determine if EP, including OPEP, resubmission is required (see Section 7.15.1). Changes with potential to influence minor or technical changes to the OPEP are tracked in management of change records, project records and incorporated during internal updates of the OPEP or the five-yearly revision.

7.16 Record Keeping

Compliance records (outlined in MC in Section 6) will be maintained.

Record keeping will be in accordance with Regulation 14(7) that addresses maintaining records of emissions and discharges.

7.17 Reporting

To meet the EPOs and standards outlined in this EP, Woodside reports at a number of levels, as outlined in the next sections.

7.17.1 Routine Reporting (Internal)

7.17.1.1 Daily Progress Reports and Meetings

Daily reports for activities are prepared and issued to key support personnel and stakeholders, by relevant managers. The report provides performance information about seabed intervention and trunkline installation activities, health, safety and environment, and current and planned work activities.

Meetings between key personnel are used to transfer information, discuss incidents, agree plans for future activities and develop plans and accountabilities for resolving issues.

7.17.1.2 Regular HSE Meetings

Regular dedicated HSE meetings are held with the offshore and Perth-based management and advisers to address targeted HSE incidents and initiatives. Minutes of these meetings are produced and distributed as appropriate.

7.17.1.3 Performance Reporting

Monthly and quarterly performance reports are developed and reviewed by the Function and Business Unit Leadership Teams. These reports cover a number of subject matters, including:

- HSE incidents (including high potential incidents and those related to this EP) and recent activities.
- Corporate KPI targets, which include environmental metrics.
- Outstanding actions as a result of audits or incident investigations.
- Technical high and low lights.

7.17.2 Routine Reporting (External)

7.17.2.1 Ongoing Consultation

In accordance with Regulation 14 (9) of the Environment Regulations, the implementation strategy must provide for appropriate consultation with relevant authorities of the Commonwealth, a State or Territory and other relevant interested persons or organisations.

Woodside's approach to ongoing consultation is that feedback and comments received from relevant persons and additional persons continue to be assessed and responded to, as required, through the life of an EP, including during EP assessment and throughout the duration of the accepted EP, in accordance with the intended outcome of consultation (as set out in Section 5)

Woodside proposes to undertake the engagements with directly impacted relevant persons and additional persons listed in Table 7-9. Relevant new information identified during ongoing consultation will be assessed using the EP Management of Knowledge (refer to Section 7.9.2 and Management of Change Process (refer to Section 7.15).

Woodside hosts community forums at which members are provided updates on Woodside activities on a regular basis (for example community reference group meetings). Representatives who present at those meetings are from community and industry and include Woodside, State Government (for instance relevant Regional Development Commissions), Local Government, Indigenous Groups, industry representative bodies, Community and industry organisations.

Relevant persons, additional persons and those who are merely interested in the activities, can otherwise remain up to date on this activity through subscribing to the Woodside website, or by reading the publicly available version of the EP on NOPSEMA's website, where available.

Should consultation feedback be received following EP acceptance that identifies a measure or control that requires implementation or update to meet the intended outcome of consultation (see

Section 5), Woodside will apply its EP Management of Knowledge process (refer to Section 7.9.2) and Management of Change process (refer to Section 7.15), as appropriate.

Woodside has developed a Program of Ongoing Engagement with Traditional Custodians (Appendix L), directly informed by feedback from Traditional Custodians. It provides a mechanism for ongoing dialogue so that Traditional Custodians can, on an ongoing basis, provide Woodside with feedback relating to the possible consequences of an activity to be carried out under an Environment Plan on their functions, interests and activities as they relate to cultural values.

The ongoing consultation engagements that Woodside intends to progress for this EP are set out in the table below.

Table 7-9: Ongoing consultation engagements

Report/ Information	Recipient	Purpose	Frequency	Content
Program of Ongoing Engagement with Traditional Custodians (Appendix L)	Relevant cultural authorities	Identification, assessment and consideration of cultural values relevant to the Operational Area and EMBA	Ongoing	Assessment of cultural values Any relevant new information on cultural values will be assessed using the EP Management of Knowledge (refer to Section 7.9.2) and Management of Change Process (refer to Section 7.15).
Notification (email) Updates (email)	AHO	As requested by AMSA during consultation.	No less than 4 weeks prior to commencement. As required.	PS 1.3 (Section 6.7.1) Date of activity start. Changes to planned activities
Notification (email) Update (email)	AMSA JRCC	As requested by AMSA during consultation	At least 24-48 hours before operations commence. Provide updates to the AHO and JRCC should there be changes to the activity.	PS 1.5 (Section 6.7.1) Date of activity start. Changes to planned activities
Notification (email)	DoD	As requested by DoD during consultation	Five weeks prior to commencement of activities.	PS 1.6 (Section 6.7.1) Date of activity start.
Notification (email)	DMIRS	To meet DMIRS requirements	At least 10 days prior to commencement	Activity start and end date
Notification (email)	Eni	As requested during consultation	At least 10 days prior to commencement	PS 1.4 (Section 6.7.1) Date of activity start and end.
Notification (email)	AFMA Relevant State and Commonwealth Fishery Licence Holders in the Operational Area (North West Slope and Trawl	Good practice	At least 10 days prior to commencement and following completion of activities.	PS 1.4 (Section 6.7.1) Date of activity start and end.

Meeting	MAC	Development of recommendations following new heritage information as it arises.	As required following new heritage information.	PS 16.7 and PS 16.8 (Section 6.10) Recommendations for appropriate heritage management.
Notification (email)	Other Relevant Persons	Notification of significant change	As appropriate	Notification of significant change
Emails / Meetings	Persons or organisations who provide feedback to Woodside post EP submission.	Identification, assessment and consideration of feedback, claims and / or objections	As appropriate	Assessment of claims and / or objections Relevant new information will be assessed using the EP Management of Knowledge (refer to Section 7.9.2) and Management of Change Process (refer to Section 7.15).
Notification (email)	WA Museum (as requested during EP consultation) Australasian Underwater Cultural Heritage Database Any other stakeholders as required in the Unexpected Finds Procedure (Section 7.7)	Report any unexpected finds of potential Underwater Cultural Heritage	If triggered by Unexpected Finds Procedure (Section 7.7)	Refer to Unexpected Finds Procedure (Section 7.7) and C2.12

7.17.2.2 Start and End Notifications of the Petroleum Activities Program

In accordance with Regulation 29, Woodside will notify NOPSEMA and DMIRS of the commencement of the Petroleum Activities Program at least ten days before the activity commences, and will notify NOPSEMA and DMIRS within ten days of completing the activity.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

7.17.2.3 Environmental Performance Review and Reporting

In accordance with applicable environmental legislation for the activity, Woodside is required to report information about environmental performance to the appropriate regulator. Regulatory reporting requirements are summarised in Table 7-10.

Table 7-10: Routine external reporting requirements

Report	Recipient	Frequency	Content
Monthly Recordable Incident Reports (Appendix D)	NOPSEMA	Monthly, by the 15th of each month.	Details of recordable incidents that have occurred during the Petroleum Activities Program for previous month (if applicable).
Environmental Performance Report	NOPSEMA	Annually, with the first report submitted within 12 months of the commencement of the Petroleum Activities Program covered by this EP (as per the requirements of Regulation 14(2)).	Compliance with EPOs, controls and standards outlined in this EP, in accordance with the Environment Regulations.
Notification to Director of National Parks	DNP	Approximately 10 days prior to entering the Montebello Marine Park and at the conclusion of activities within the Australian Marine Park.	Notifications can be made to marineparks@environment.gov.au

7.17.2.4 End of the Environmental Plan

The EP will end when Woodside notifies NOPSEMA that the Petroleum Activities Program has ended and all of the obligations identified in this EP have been completed, and NOPSEMA has accepted the notification, in accordance with Regulation 25A of the Environment Regulations.

7.17.3 Incident Reporting (Internal)

The process for reporting environmental incidents is described in Section 7.17.4 of this EP. It is the responsibility of the Woodside Project Manager to ensure reporting of environmental incidents meets Woodside and regulatory reporting requirements as detailed in the Woodside HSE Event Reporting and Investigation Procedure and this section of this EP.

7.17.4 Incident Reporting (External) – Reportable and Recordable

7.17.4.1 Reportable Incidents

7.17.4.1.1 Definition

A reportable incident is defined under Regulation 4 of the Environment Regulations as:

- ‘an incident relating to the activity that has caused, or has the potential to cause, moderate to significant environmental damage’.

A reportable incident for the Petroleum Activities Program is:

- an incident that has caused or has the potential to cause environmental damage with a Consequence Level of Moderate (C) or above (as defined under Woodside’s Risk Table (refer to Appendix A and Section 6)).

The environmental risk assessment (Section 6) for the Petroleum Activities Program identifies those risks with a potential consequence level of C+ for environment. The environmental risk assessment identified one risk with a potential consequence level of C+ for environment. The highest consequence identified in the risk assessment was a *Loss of hydrocarbons to marine environment due to a vessel collision*, with a consequence level of B for environment.

Any such incidents (with a Consequence Level of Moderate (C)) represent potential events which would be reportable incidents. Incident reporting is performed with consideration of NOPSEMA (2014) guidance stating, 'if in doubt, notify NOPSEMA', and assessed on a case-by-case basis to determine if they trigger a reportable incident as defined in this EP and by the Regulations.

7.17.4.1.2 Notification

NOPSEMA will be notified of all reportable incidents, according to the requirements of Regulations 26, 26A and 26AA of the Environment Regulations. Woodside will:

- Report all reportable incidents to the regulator (orally) ASAP, but within two hours of the incident or of its detection by Woodside.
- Provide a written record of the reported incident to NOPSEMA, the National Offshore Petroleum Titles Administrator (NOPTA) and the Department of the responsible State Minister (DMIRS) ASAP after orally reporting the incident.
- Complete a written report for all reportable incidents using a format consistent with the NOPSEMA Form FM0831 – Reportable Environmental Incident (Appendix D) which must be submitted to NOPSEMA ASAP, but within three days of the incident or of its detection by Woodside.
- Provide a copy of the written report to the NOPTA and DMIRS, within seven days of the written report being provided to NOPSEMA.

AMSA will be notified of oil spill incidents ASAP after their occurrence, and DCCEEW notified if MNES are to be affected by the oil spill incident.

7.17.4.2 Recordable Incidents

7.17.4.2.1 Definition

A recordable incident as defined under Regulation 4 of the Environment Regulations is an incident arising from the activity that 'breaches an environmental performance outcome or environmental performance standard, in the EP that applies to the activity, that is not a reportable incident'.

7.17.4.2.2 Notification

NOPSEMA will be notified of all recordable incidents, according to the requirements of Regulation 26B(4), no later than 15 days after the end of the calendar month using the NOPSEMA Form – Recordable Environmental Incident Monthly Summary Report (Appendix D) detailing:

- All recordable incidents that occurred during the calendar month.
- All material facts and circumstances concerning the recordable incidents that the operator knows or is able, by reasonable search or enquiry, to find out.
- Any action taken to avoid or mitigate any adverse environment impacts of the recordable incidents.
- The corrective action that has been taken, or is proposed to be taken, to prevent similar recordable incidents.
- The action that has been taken, or is proposed to be taken, to prevent a similar incident occurring in the future.

7.18 Other External Incident Reporting Requirements

In addition to the notification and reporting of environmental incidents defined under the Environment Regulations and Woodside requirements, Table 7-11 describes the incident reporting requirements that also apply in the Operational Area.

For oil spill incidents, other agencies and organisations will be notified as appropriate to the nature and scale of the incident, as per procedures and contact lists in the [Oil Pollution Emergency Arrangements \(Australia\)](#) and Oil Pollution First Strike Plan (refer to Appendix J).

Woodside prioritises engagement with those persons who may be directly affected, either by the incident itself or in relation to the regulatory or decision-making capacity with respect to incident response. Should it be identified that additional persons such as, but not limited to, commercial fishers, tourism operators or relevant cultural authorities who may be affected within the EMBA, Woodside would, at the relevant time, engage with these parties as appropriate.

Table 7-11: External Incident Reporting Requirements

Event	Responsibility	Notifiable party	Notification requirements	Contact	Contact detail
Any marine incidents during Petroleum Activities Program	Vessel Master	AMSA	Incident Alert Form 18 as soon as reasonably practicable* Within 72 hours after becoming aware of the incident, submit Incident Report Form 19	AMSA	reports@amsa.gov.au
Oil pollution incidents in Commonwealth waters	Vessel Master	AMSA Rescue Coordination Centre (RCC)	As per Article 8 and Protocol I of MARPOL within two hours via the national emergency 24-hour notification contacts and a written report within 24 hours of the request by AMSA	AMSA RCC Australia	If the ship is at sea, reports are to be made to: Free call: 1800 641 792 Phone: 08 9430 2100 (Fremantle)
Oil pollution incidents in Commonwealth waters	Vessel Master	AMSA	Without delay as per Protection of the Sea Act, part II, section 11(1), AMSA RCC notified verbally via the national emergency 24-hour notification contact of the hydrocarbon spill; follow up with a written Pollution Report ASAP after verbal notification	RCC Australia	Phone: 1800 641 792 or +61 2 6230 6811 AFTN: YSARYCYX
Any oil pollution incident which has the potential to enter a National Park or requires oil spill response activities to be conducted within a National Park	Vessel Master	DCCEEW	Reported verbally, ASAP	Director of National Parks	Phone: 02 6274 2220
Activity causes unintentional death of or injury to fauna species listed as Threatened or Migratory under the EPBC Act	Woodside	DCCEEW	Within seven days of becoming aware	Secretary of the DCCEEW	Phone: 1800 803 772 Email: protected.species@environment.gov.au
Any emergency, accident, hazardous situation, near miss and/or any pollution incident in or with potential to impact PPA waters	Vessel Master	PPA	All incidents and near misses on a vessel must be reported to PPA Dampier Vessel Traffic Services (VTS) immediately It is a PPA requirement that the any incident or near miss shall prepare a report and send	PPA Dampier Vessel Traffic Services	VHF 11 (Port vessel working channel) VHF 16 (Port vessel emergency channel) (08) 9159 6556 (landline telephone) 0428 888 800 (24 hour emergency mobile telephone)

Page 530 of 582

Uncontrolled when printed. Refer to electronic version for most up to date information.

The following pollution activities should also be reported to AMSA via RCC Australia by the Vessel Master are:

- loss of plastic material
- garbage disposed of in the sea within 12 nm of land (garbage includes food, paper, bottles, etc)
- any loss of hazardous materials.

External incident reporting requirements under the *OPGGS (Safety) Regulations*, including under Subregulation 2.42, notices and reports of dangerous occurrences will be reported to NOPSEMA under the approved activity safety cases.

7.19 Emergency Preparedness and Response

7.19.1 Overview

Under Regulation 14(8), the implementation strategy must contain an Oil Pollution Emergency Plan (OPEP) and provide for updating the OPEP. Regulation 14(8AA) outlines the requirements for the OPEP which must include adequate arrangements for responding to and monitoring oil pollution.

A summary of how this EP and supporting documents address the various requirements of Environment Regulations relating to oil pollution response arrangements is shown in Table 7-12.

Table 7-12: Oil pollution and preparedness and response overview

Content	Environment Regulations Reference	Document/Section Reference
Details of (oil pollution response) control measures that will be used to reduce the impacts and risks of the activity to ALARP and an acceptable level	Regulation 13(5), (6), 14(3)	Oil Spill Preparedness and Response Mitigation Assessment (Appendix D)
Describes the OPEP	Regulation 14(8)	<p>EP: Woodside’s oil pollution emergency plan has the following components:</p> <ul style="list-style-type: none"> • Woodside Oil Pollution Emergency Arrangements (Australia) • Oil Pollution First Strike Plan (Appendix J) • Oil Spill Preparedness and Response Mitigation Assessment (Appendix D) <p>In accordance with Regulation 31 of the Environmental Regulations the Woodside Oil Pollution Emergency Arrangements (Australia) was provided with the Julimar Phase 2 Drilling and Subsea Installation EP, accepted by NOPSEMA on 8 November 2019.</p>
Details the arrangements for responding to and monitoring oil pollution (to inform response activities), including control measures	Regulation 14(8AA)	<p>Oil Spill Preparedness and Response Mitigation Assessment (Appendix D)</p> <p>Oil Pollution First Strike Plan (Appendix J)</p>

Content	Environment Regulations Reference	Document/Section Reference
Demonstrates that the oil pollution response arrangements are consistent with the national system for oil pollution preparedness and control	Regulation 14(8E)	Oil Pollution Emergency Arrangements (Australia)

7.19.2 Emergency Response Training

Regulation 14(5) requires that the implementation strategy includes measures to ensure that employees and contractors have the appropriate competencies and training (Table 7-13). Woodside has conducted a risk-based training needs analysis on positions required for effective oil spill response. Following the mapping of training to Woodside identified competencies, training was then mapped to positions based on their required competencies.

Table 7-13: Minimum levels of competency for key IMT positions

IMT Position	Minimum Competency
Corporate Incident Coordination Centre (CICC) Leader	<ul style="list-style-type: none"> • Incident and Crisis Leadership Development Program (ICLDP) • Oil Spill Response Skills Enhancement Course (OSREC – internal course) • Participation in L2 oil spill exercise (initial) • Participation in L2 oil spill exercise (refresher)
Security and Emergency Manager Duty Manager	<ul style="list-style-type: none"> • ICLDP • OSREC • IMO2 or equivalent spill response specialist level with an oil spill response organisation (OSRO) • Participation in L2 oil spill exercise (initial) • Participation in L2 oil spill exercise (refresher)
Operations, Planning, Logistics, Safety	<ul style="list-style-type: none"> • OSREC • ICC Fundamentals Course (internal course) • Participation in L2 oil spill exercise (initial) • Participation in L2 oil spill exercise (refresher)
Environment Coordinator	<ul style="list-style-type: none"> • ICC Fundamentals • OSREC • IMO2 or equivalent spill response specialist level with an OSRO • Participation in L2 oil spill exercise (initial) • Participation in L2 oil spill exercise (refresh)
Note on competency/equivalency	

- In 2018 Woodside undertook a review of incident and crisis systems, processes and tools to assess whether these were fit-for purpose and has rolled out a change to the Incident and Crisis Management training and the oil spill response training requirements for both ICC and field-based roles.
- The revised ICC Fundamentals training Program and Incident and Crisis Leaders Development Program (ICLDP) align with the performance requirements of the *PMAOMIR320 – Manage Incident Response Information* and *PMAOM0R418 - Coordinate Incident Response*.
- Regarding training specific equivalency;
- ICLDP is mapped to *PMAOM0R418* (and which is equivalent to IMOIII when combined with Woodside's OSREC course) and ensures broader incident management principles aligned with Australasian Inter-service Incident Management System (AIIMS).
- The revised ICC Fundamentals Course is mapped to *PMAOMIR320* (and which is equivalent to IMOII). The blended learning program offers modules aligned to IMOIII, IMOII, IMO I and AMOSC Core Group Training Oil Spill Response Organisation Specialist Level training.
- OSREC involves the completion of two (2) online AMSA Modules (Introduction to National Plan and Incident management; and Introduction to oil spills) as well as elements of IMO I and IMOII tailored to Woodside specific OSR capabilities.
- Woodside Learning Services (WLS) are responsible for collating and maintaining personnel training records. The HSP Dashboard reflects the competencies required for each oil spill role (IMT/operational).

7.19.3 Emergency Response Preparation

The CICC, based in Woodside's head office in Perth, is the onshore coordination point for an offshore emergency. The CICC is staffed by a roster of appropriately skilled personnel available on call 24 hours a day. The CICC, under the leadership of the CICC Leader, supports the site-based Incident Management Team by providing additional support in areas such as operations, logistics, planning, people management and public information (corporate affairs). A description of Woodside's Incident Command Structure and arrangements is further detailed in the [Woodside Oil Pollution Emergency Arrangements \(Australia\)](#).

Woodside will have an Emergency Response Plan (ERP) in place relevant to the Petroleum Activities Program. The ERP provides procedural guidance specific to the asset and location of operations to control, coordinate and respond to an emergency or incident. For a vessel activity, the ERP will be a bridging document to the contracted vessels emergency documentation. This document summarises the emergency command, control and communications processes for the integrated operation and management of an emergency. It is developed in collaboration with the contracted vessel and ensures roles and responsibilities between the contracted vessel and Woodside personnel are identified and understood. The ERPs will contain instructions for vessel emergency, medical emergency, search and rescue, reportable incidents, incident notification, contact information and activation of the contractor's emergency centre and Woodside Communication Centre (WCC).

In the event of an emergency of any type:

- Vessel Master (depending on the location of the emergency) will assume overall onsite command and act as the IC. All persons will be required to act under the IC's directions. The vessels will maintain communications with the onshore project manager and/or other emergency services in the event of an emergency. Emergency response support can be provided by the contractor's emergency centre or WCC if requested by the IC.
- The project vessels will have on-board equipment for responding to emergencies including medical equipment, fire-fighting equipment and oil spill response equipment.

7.19.4 Oil and Other Hazardous Materials Spill

A significant hydrocarbon spill during the proposed Petroleum Activities Program is unlikely, but should such an event occur, it has the potential to result in a serious safety or environmental incident and cause asset and reputational damage if not managed properly. The [Woodside Oil Pollution](#)

[Emergency Arrangements \(Australia\)](#) document, supported by the Oil Pollution First Strike Plan (Appendix J) which provides tactical response guidance to the activity/area and Appendix D this EP, cover spill response for this Petroleum Activities Program.

The Security and Emergency Management Function is responsible for managing Woodside's hydrocarbon spill response equipment and for maintaining oil spill preparedness and response documentation. In the event of a major spill, Woodside will request that AMSA (administrator of the National Plan) provides support to Woodside through advice and access to equipment, people and liaison. The interface and responsibilities, as defined under the National Plan, are described in the [Woodside Oil Pollution Emergency Arrangements \(Australia\)](#). AMSA and Woodside have a Memorandum of Understanding in place to support Woodside in the event of an oil spill.

The Oil Pollution First Strike Plan provides immediate actions required to commence a response (Appendix J).

Project vessels will have SOPEPs in accordance with the requirements of MARPOL 73/78 Annex I. These plans outline responsibilities, specify procedures and identify resources available in the event of a hydrocarbon or chemical spill from vessel activities. The Oil Pollution First Strike Plan is intended to work in conjunction with the SOPEPs, if hydrocarbons are released to the marine environment from a vessel.

Woodside has established EPOs, performance standards and MC to be used for oil spill response during the Petroleum Activities Program, as detailed in Appendix D.

7.19.5 Emergency and Spills Response

Woodside categorises incidents and emergencies in relation to response requirements as follows:

7.19.5.1 Level 1

Level 1 incidents are those that can be resolved using existing resources, equipment and personnel. A Level 1 incident is contained, controlled and resolved by site/regionally based teams using existing resources and functional support services.

7.19.5.2 Level 2

Level 2 incidents are characterised by a response that requires external operational support to manage the incident. It is triggered if the capabilities of the tactical level response are exceeded. This support is provided to the activity by activating all or part of the responsible CICC.

7.19.5.3 Level 3

A Level 3 incident or crisis is identified as a critical event that seriously threatens the organisation's people, the environment, company assets, reputation, or livelihood. At Woodside, the Crisis Management Team (CMT) manages the strategic impacts in order to respond to and recover from the threat to the company (material impacts, litigation, legal and commercial, reputation etc.). The ICC may also be activated as required to manage the operational incident response.

7.19.6 Emergency and Spill Response Drills and Exercises

Woodside's capability to respond to incidents will be tested periodically, in accordance with the Emergency and Crisis Management Procedure. The scope, frequency and objective of these tests is described in Table 7-14. Emergency response testing is aligned to existing or developing risks associated with Woodside's operations and activities. Corporate hazards/risks outlined in the corporate risk register, respective Safety Cases or project Risk Registers, are reference points developing and scheduling emergency and crisis management exercises. External participants may be invited to attend exercises (e.g. government agencies, specialist service providers, oil spill response organisations, or industry members with which Woodside has mutual aid arrangements).

The overall objective of exercises is to test procedures, skills and the teamwork of the Emergency Response and Command Teams in their ability to respond to major accident / major environment events. After each exercise, the team holds a debriefing session, during which the exercise is reviewed. Any lessons learned or areas for improvement are identified and incorporated into revised procedures, where appropriate.

Table 7-14: Testing of response capability

Response Category	Scope	Response Testing Frequency	Response Testing Objective
Level 1 Response	Exercises are project-/ activity-specific ¹	At least one Level 1 First Strike drill must be conducted during an activity. For campaigns with an operational duration of greater than one month this will occur within the first two weeks of commencing the activity and then at least every 6 month hire period thereafter.	Comprehensive exercises test elements of the <i>Seabed Intervention and Trunkline Installation</i> Oil Pollution First Strike Plan (Appendix J). Emergency drills are scheduled to test other aspects of the Emergency Response Plan.
		At least one Level 1 First Strike notification drill must be conducted prior to commencement of activity in the vicinity of another Titleholder's operating assets i.e. third party pipeline crossings.	Test notifications to other Titleholders per <i>Seabed Intervention and Trunkline Installation</i> Oil Pollution First Strike Plan (Appendix J).
Level 2 Response	Exercises are vessel specific ²	Level 2 Emergency Management exercises are relevant to activities with an operational duration of one month or greater. At least one Emergency Management exercise per vessel per campaign must be conducted within the first month of commencing the activity and then at every 6 month hire period thereafter, where applicable based on duration.	Testing both the facility IMT response and/or that of the CICC following handover of incident control.
Level 3 Response	Exercises are relevant to all Woodside assets	The number of CMT exercises conducted each year is determined by the Chief Executive Officer, in consultation with the Vice President of Security and Emergency Management.	Test Woodside's ability to respond to and manage a crisis level incident.

¹ Please note that for this EP, Level 1 drills will be applicable to PV, SWLB, TSHD and RIV

² Please note that for this EP, Level 2 exercises will be applicable to PV only

7.19.7 Hydrocarbon Spill Response Testing of Arrangements

Woodside is required to test hydrocarbon spill response arrangements as per regulations 8B and 8C of the Environment Regulations. Woodside's arrangements for spill response are common across its Australian operating assets and activities to ensure the controls are consistent. The overall objective of testing these arrangements is to ensure that Woodside maintains an ability to respond to a hydrocarbon spill, specifically to:

- Ensure relevant responders, contractors and key personnel understand and practise their assigned roles and responsibilities.
- Test response arrangements and actions to validate response plans.
- Ensure lessons learned are incorporated into Woodside's processes and procedures and improvements are made where required.

If new response arrangements are introduced, or existing arrangements significantly amended, additional testing is undertaken accordingly. Additional activities or activity locations are not anticipated to occur; however, if they do, testing of relevant response arrangements will be undertaken as soon as practicable.

In addition to the testing of response capability described in Table 7-14, up to eight formal exercises are planned annually, across Woodside, to specifically test arrangements for responding to a hydrocarbon spill to the marine environment.

7.19.7.1 Testing of Arrangements Schedule

Woodside's Testing of Arrangements Schedule (Figure 7-7) aligns with international good practice for spill preparedness and response management; the testing is compatible with the IPIECA Good Practice Guide and the Australian Emergency Management Institute Handbook. If a spill occurs, enacting these arrangements will underpin Woodside's ability to implement a response across its petroleum activities. Figure 7-7 shows a condensed snapshot of Woodside's 5-year rolling Testing of Arrangements Schedule.

Numbered hydrocarbon spill arrangements listed in the rows of the schedule are taken from the support plans and operational plans described in Section 1.4 of Appendix D. Each arrangement has a support agency/company and an area to be tested (e.g. capability, equipment and personnel). For example, an arrangement could be to test Woodside’s personnel capability for conducting scientific monitoring, or the ability of the Australian Marine Oil Spill Centre to provide response personnel and equipment. About 75 hydrocarbon spill preparedness arrangements are tested annually across the eight planned exercises, as described above.

The vertical columns under each year in Figure 7-7 relate to an individual exercise or additional assurance actions that are conducted over the 5-year rolling schedule. The sub-heading for the column describes the standard method of testing (e.g. discussion exercise, desktop exercise), and the blue cells indicate the arrangements that could be tested for each method.

Arrangements in the schedule are tested at least once a year; however, some arrangements may be tested across multiple exercises (e.g. critical arrangements) or via other ‘additional assurance’ methods outside the formal Testing of Arrangements Schedule that also constitute sufficient evidence of testing of arrangements (e.g. audits, no-notice drills, internal exercises, assurance drills) (refer to the first and second vertical columns for each year in Figure 7-7).

7.19.7.2 Exercises, Objectives, and KPIs

Exercises are designed to cumulatively provide assurance for all arrangements within Woodside’s Testing of Arrangements Schedule annually across all facilities. Exercise-initiating scenarios are derived from the worst-case credible scenarios as described in the relevant facility’s First Strike Plans.

Objectives and KPIs for each exercise are determined by reviewing:

- The Testing of Arrangements Schedule, which identifies which arrangements can be tested for each testing method (Section 7.19.7.1).
- The objectives and KPIs master generic plan, which summarises generic objectives and KPIs that could be tested for specific response strategies, based on industry good practice guidance (i.e. IPIECA) for testing oil spill arrangements.
- The oil spill ALARP commitments register, which summarises all spill response commitments from accepted EPs (e.g. timings, numbers) for different response strategies, and considers priority commitments and worst-cast spill scenarios.
- Actions undertaken from recommendations from previous exercises, where relevant.

The required capabilities, number of personnel, equipment, and timeframes (i.e. arrangements) form specific KPIs during an exercise. Where this is the case, the ALARP commitments register indicates the specific response strategy performance standards to use/test the arrangements against. Where relevant the most stringent performance standard across all in-force EPs is used as the KPI. After each exercise, a report is produced that includes recommendations for improvements, which are then converted to actions and tracked in the Testing of Arrangements Register.

Additional assurance actions are also routinely undertaken outside formal exercises (e.g. response audits, no-notice drills), which support testing of these arrangements. Evidence and outcomes from additional assurance actions are used, where relevant, to support testing individual arrangements, including from external sources (e.g. evidence of suppliers testing their own arrangements).

7.19.7.3 Cyclone and Dangerous Weather Preparation

As the timing of some activities associated with the Petroleum Activities Program are not yet determined, it is possible seabed intervention and trunkline installation activities will overlap with the cyclone season (November to April, with most cyclones occurring between January and March). If conducting activities in cyclone season, the vessel contractors must have a Cyclone Contingency

Plan (CCP) in place outlining the processes and procedures that would be implemented during a cyclone event, which will be reviewed and accepted by Woodside.

The project vessels will receive daily forecasts from the Bureau of Meteorology. If a cyclone (or severe weather event) is forecast, the path and its development will be plotted and monitored using the BoM data. If there is the potential for the cyclone (severe weather event) to affect the Petroleum Activities Program, the CCP will be actioned. If required, vessels can transit from the proposed track of the cyclone (severe weather event).

9 GLOSSARY AND ABBREVIATIONS

9.1 Glossary

Term	Meaning
(the) Regulator	The Government Agency (State or Commonwealth) that is the decision maker for approvals and performs ongoing regulation of the approval once granted
3D seismic data	A set of numerous closely-spaced seismic lines that provide a high spatially sampled measure of subsurface reflectivity and 3D image
Acceptability	The EP must demonstrate that the environmental impacts and risks of an activity will be of an acceptable level as per Regulation 10A(c).
ALARP	A legal term in Australian safety legislation, it is taken here to mean that all contributory elements and stakeholders have been considered by assessment of costs and benefits, and which identifies a preferred course of action
API (gravity)	A measure of how heavy or light a petroleum liquid is compared to water
Australian Standard	An Australian Standard that provides criteria and guidance on design, materials, fabrication, installation, testing, commissioning, operation, maintenance, re-qualification and abandonment
Ballast	Extra weight taken on to increase a ship's stability to prevent rolling and pitching. Most ships use seawater as ballast. Empty tank space is filled with inert (non-combustible) gas to prevent the possibility of fire or explosion.
Bathymetry	Related to water depth, a bathymetry map shows the depth of water at a given location on the map.
Benthos/Benthic	Relating to the seabed and includes organisms living in or on sediments/rocks on the seabed
Biodiversity	Relates to the level of biological diversity of the environment. The EPBC Act defines biodiversity as "the variability among living organisms from all sources (including terrestrial, marine and other aquatic ecosystems and the ecological complexes of which they are part) and includes: (a) diversity within species and between species; and (b) diversity of ecosystems".
Biota	The animal and plant life of a particular region, habitat or geological period
Cetacean	Whale and dolphin species
Consequence	The worst-case credible outcome associated with the selected event, assuming some controls (prevention and mitigation) have failed. Where more than one impact applies (e.g. environmental and legal/compliance), the consequence level for the highest severity impact is selected.
Coral	Anthozoa that are characterised by stone-like, horny or leathery skeletons (external or internal). The skeletons of these animals are also called coral.
Coral Reef	A wave-resistant structure resulting from skeletal deposition and cementation of hermatypic corals, calcareous algae, and other calcium carbonate-secreting organisms
Crustacean	A large and variable group of mostly aquatic invertebrates that have a hard external skeleton (shell), segmented bodies, with a pair of often very modified appendages on each segment, and two pairs of antennae (e.g. crabs, crayfish, shrimps, wood lice, water fleas and barnacles)
Cyclone	A rapidly-rotating storm system characterised by a low-pressure centre, strong winds, and a spiral arrangement of thunderstorms that produce heavy rain
Datum	A reference location or elevation that is used as a starting point for subsequent measurements
dB	Decibel, a measure of the overall noise level of sound across the audible spectrum with a frequency weighting (that is, 'A' weighting) to compensate for the varying sensitivity of the human ear to sound at different frequencies

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Meaning
dB re 1 μPa^2	Measure of underwater noise, in terms of sound pressure. Because the dB is a relative measure rather than an absolute measure, it must be referenced to a standard 'reference intensity', in this case 1 micro Pascal (1 mPa), which is the standard reference that is used. The dB is also measured over a specified frequency, which is usually either a one Hertz bandwidth (expressed as dB re 1 mPa^2/Hz), or over a broadband that has not been filtered. Where a frequency is not specified, it can be assumed that the measurement is a broadband measurement.
dB re 1 $\mu\text{Pa}^2.\text{s}$	Normal unit for sound exposure level
Demersal	Living close to the floor of the sea (typically of fish)
Drill casing	Tubing that is set inside the drilled well to protect and support the well stream
Drilling fluids	<p>The main functions of drilling fluids include providing hydrostatic pressure to prevent formation fluids from entering the well bore, keeping the drill bit cool and clean during drilling, performing drilled cement, and suspending the drilled cement while drilling is paused and when the drilling assembly is brought in and out of the hole. The drilling fluid used for a particular job is selected to avoid formation damage and to limit corrosion.</p> <p>The three main categories of drilling fluids are water-based muds (which can be dispersed and non-dispersed), non-aqueous muds, usually called oil-based mud, and gaseous drilling fluid, in which a wide range of gases can be used.</p>
DRIMS	Woodside's internal document management system
Dynamic positioning	In reference to a marine vessel that uses satellite navigation and radio transponders in conjunction with thrusters to maintain its position
EC ₅₀	The concentration of a drug, antibody or toxicant which induces a response halfway between the baseline and maximum after a specified exposure time
Echinoderms	Any of numerous radially symmetrical marine invertebrates of the phylum Echinodermata, which includes the starfish, sea urchins and sea cucumbers, that have an internal calcareous skeleton and are often covered with spines
Endemic	A species that is native to or confined to a certain region
Environment	The surroundings in which an organisation operates, including air, water, land, natural resources, flora, fauna, humans and their interrelations (Source: ISO 14001)
EP	Prepared in accordance with the <i>OPGGS (Environment) Regulations 2009</i> , which must be assessed and accepted by the Designated Authority (NOPSEMA) before any petroleum-related activity can be performed
Environment Regulations	OPGGS (Environment) Regulation 2009
Environmental approval	The action of approving something, which has the potential to have an adverse impact on the environment. Environmental impact assessment is generally required before environmental approval is granted.
Environmental Hazard	The characteristic of an activity or event that could potentially cause damage, harm or adverse effects on the environment
Environmental impact	Any change to the environment, whether adverse or beneficial, wholly or partially resulting from an organisation's activities, products or services (Source: HB 203:2006).
Environmental impact assessment	An orderly and systematic process for evaluating a proposal or scheme (including its alternatives), and its effects on the environment, and mitigation and management of those effects (Source: Western Australian <i>Environmental Impact Assessment Administrative Procedures 2010</i>)
EPBC Act	<i>Environment Protection and Biodiversity Conservation Act 1999</i> . Commonwealth legislation designed to promote the conservation of biodiversity and protection of the environment.
Epifauna	Benthic animals that live on the surface of a substrate
Fauna	Collectively, the animal life of a particular region

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Term	Meaning
Flora	Collectively, the plant life of a particular region
IC ₅₀	A measure of the effectiveness of a compound in inhibiting biological or biochemical function
Infauna	Aquatic animals that live in the substrate of a body of water, especially in a soft sea bottom
ISO 14001	ISO 14001 is an international standard that specifies a process (called an EMS) for controlling and improving a company's environmental performance. An EMS provides a framework for managing environmental responsibilities so they become more efficient and more integrated into overall business operations.
Jig Fishing	Fishing with a jig, which is a type of fishing lure. A jig consists of a lead sinker with a hook moulded into it and usually covered by a soft body to attract fish.
LC ₅₀	The concentration of a substance that is lethal to 50% of the population exposed to it for a specified time
Likelihood	The description that best fits the chance of the selected consequence actually occurring, assuming reasonable effectiveness of the prevention and mitigation controls
MARPOL (73/78)	The International Convention for the Prevention of Pollution from Ships 1973, as modified by the Protocol of 1978. MARPOL 73/78 is one of the most important international marine environmental conventions. It was designed to minimise pollution of the seas, including dumping, oil and exhaust pollution. Its stated objective is to preserve the marine environment through the complete elimination of pollution by oil and other harmful substances and the minimisation of accidental discharge of such substances.
Meteorology	The study of the physics, chemistry and dynamics of the earth's atmosphere, including the related effects at the air–earth boundary over both land and the oceans
Mitigation	Management measures that minimise and manage undesirable consequences
NOHSC (1008:2004)	National Occupational Health and Safety Commission – Approved Criteria for Classifying Hazardous Substances
Oligotrophic	Low in plant nutrients and having a large amount of dissolved oxygen throughout
pH	Measure of the acidity or basicity of an aqueous solution
Protected Species	Threatened, vulnerable or endangered species that are protected from extinction by preventive measures. Often governed by special Federal or State laws.
Putrescible	Refers to food scraps and other organic waste associated with food preparation that will be subject to decay and rot (putrefaction)
Risk	The combination of the consequences of an event and its associated likelihood. For guidance, see Environmental Guidance on Application of Risk Management Procedure.
Stereo-BRUVS	Stereo-baited remote underwater video systems
Sessile	Organism that is fixed in one place; immobile
Syngnathids	Family of fish which includes the seahorses, the pipefish, and the weedy and leafy sea dragons
Teleost	A fish belonging to the Teleostei or Teleostomi, a large group of fish with bony skeletons, including most common fish. The teleosts are distinct from the cartilaginous fish such as sharks, rays, and skates.
Thermocline	A temperature gradient in a thermally stratified body of water
Zooplankton	Plankton consisting of small animals and the immature stages of larger animals

9.2 Abbreviations

Abbreviation	Meaning
µm	Micrometer
AHC	Active Heave Compensated
AHO	Australian Hydrographic Office
AIIMS	Australasian Inter-service Incident Management Systems
AIS	Automatic Identification System
ALARP	As Low As Reasonably Practicable
AMOSC	Australian Marine Oil Spill Centre
AMPS	Australian Marine Parks
AMSA	Australian Maritime Safety Authority
API	American Petroleum Institute
ATSB	Australian Transport Safety Bureau
AusSAR	Australian Search and Rescue
AUV	Autonomous Underwater Vehicle
Bbl/MMscf	Barrels per million Standard Cubic Feet of gas
BCF	Bioconcentration Factor
BCH	Benthic Communities and Habitat
BHP	BHP Billiton Petroleum (North West Shelf) Pty Ltd
BIA	Biologically Important Area
BoM	Bureau of Meteorology
BTEX	Benzene, toluene, ethylbenzene and xylenes
°C	Degrees Celsius
(C)	Consequence level of moderate
C	Control
CAES	Catch and Effort System
CCP	Cyclone Contingency Plan
CEFAS	Centre for Environment, Fisheries and Aquaculture Science
CH ₄	Methane
CICC	Corporate Incident Coordinate Centre
CM	Control Measure
CMT	Crisis Management Team
CO	Carbon monoxide
CO ₂	Carbon dioxide
cP	Centipoises
CS	Cost/Sacrifice
CSIRO	Commonwealth Scientific and Industrial Research Organisation
Cth	Commonwealth
CWP	Central Western Province
CWST	Central Western Shelf Transition

Abbreviation	Meaning
(D)	Consequence level Minor
DAA	Department of Aboriginal Affairs
DAWE	Department of Agriculture, Water and the Environment
DCCEEW	Department of Climate Change, Energy, the Environment and Water
DEWHA	Department of Environment, Water, Heritage and the Arts
DGPS	Differential GPS
DHSC	Deep History of Sea Country
DMA	Dead Man Anchor
DMIRS	Department of the Responsible State Minister
DMP	Department of Mines and Petroleum
DNP	Director of National Parks
DP	Dynamically Positioned
DPIRD	Department of Primary Industries and Regional Development
DSDMP	Dynamic System Development Method
(E)	Slight Risk Consequence
E and P	Exploration and Production
Environment Regulations	Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009 (Cth)
EMBA	Environment that May Be Affected
EMS	Environmental Management System
ENVID	Environmental hazard Identification
EP	Environment Plan
EPA	Environmental Protection Authority
EPBC Act	Environmental Protection and Biodiversity Conservation Act 1999
EPO's	Environmental Performance Outcomes
EPS	Environmental Performance Standards
ERP	Emergency Response Plan
ESD	Ecologically Sustainable Development
(F)	Negligible risk consequence
F	Control Feasibility
FCGT	Flood, Clean, Gauge and Hydrotest
FEED	Front End Engineering Design
F-Pil	Flatback-Pilbara (marine turtle genetic stock)
FPU	Floating Production Unit
FPV	Fall Pipe Vessel
G-NWS	Green-North West Shelf (marine turtle genetic stock)
GDA	Geocentric Datum of Australia
GHG	Greenhouse gas
g/m ²	Grams per square metre
HFCs	Hydrofluorocarbon

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved.

Abbreviation	Meaning
HFO	Heavy fuel oil
HOCNF	Harmonised Offshore Chemical Notification Format
HSE	Health, Safety and Environment
HSPU	Hydrocarbon Spill Preparedness Unit
HQ	Hazard Quotient
H-WA	Hawksbill-Western Australia (marine turtle genetic stock)
IAPP	International Air Pollution Prevention
IC	Incident Controller
ICC	Incident Coordination Centre
ICLDP	Incident Crisis Leadership Development Program
IMCRA	Integrated Marine and Coastal Regionalisation of Australia
IMO	International Marine Organisation
IMS	Invasive Marine Species
IMT	Incident Management Team
IPIECA	International Petroleum Industry Environmental Conservation Association
IS	Implementation Strategy
ISO	International Organization for Standardization
ISPP	International Sewage Pollution Prevention
ITF	Indonesian Throughflow
ITOPF	International Tank Owners Pollution Federation Limited
IUCN	International Union for Conservation of Nature
JSA	Job Safety Assessment
JRCC	Joint Rescue Coordination Centre
KEF	Key Ecological Feature
Kg/m ³	Kilograms per metre cubed
Km	Kilometres
KP	Kilometre Point
KPI	Key Performance Indicator
LBL	Long Baseline
LED	Light emitting diode
LH-WA	Loggerhead-Western Australia (marine turtle genetic stock)
L/km ²	Litres per square Kilometre
MARPOL	International Convention for the Prevention of Pollution from Ships
MBES	Multi Beam Echo Sounders
MCs	Measurement Criteria
MDO	Marine Diesel Oil
MEG	Mono-ethylene Glycol
MFE	Mass Flow Excavator
MFO	Marine Fauna Observers

Abbreviation	Meaning
MGA	Map Grid of Australia
MGO	Magnesium Oxide
MMA-WHA	Marine Management Area - World Heritage Area
MMSI	Maritime Mobile Service Identity
MNES	Matters of National Environmental Significance
MOC	Management of Change
MODU	Mobile Offshore Drilling Unit
MP	Marine Park
MPA	Marine Protected Areas
MSIN	Maritime Safety Information Notifications
MUZ	Multiple Use Zone
N/A	Not Applicable
NDE	Non-destructive examination
NERA	National Energy Resources Australia
NHP	National Heritage Places
NIMS	Non-indigenous Marine Species
N ₂ O	Nitrous oxide
NOAA	National Oceanic and Atmospheric Administration
NOEC	No-Observed-Effect Concentrations
NOx	Oxides of nitrogen
NOPSEMA	National Offshore Petroleum Safety and Environmental Management Authority
NOPTA	National Offshore Petroleum Title Administrator
NTM	Notice to Mariners
NWMR	North-west Marine Region
NWP	Northwest Province
NWSP	North West Shelf Province
NWS Project	North West Shelf Project
NWSTF	North West Slope Trawl Fishery
NWT	North West Transition
OCNS	Offshore Chemical Notification Scheme
OCV	Offshore Construction Vessel
OILMAP	Oil Spill Prediction Modelling System
OIM	Offshore Installation Manager
OIW	Oil In Water
OPEP	Oil Pollution Emergency Plan
OPGGS	Offshore Petroleum and Greenhouse Gas Storage Act 2006
OPP	Offshore Project Proposal
OSPAR Convention	Oslo and Paris Commission for the Convention for the Protection of the Marine Environment of the North-East Atlantic

Abbreviation	Meaning
OSREC	Oil Spill Response Skills Enhancement Course
OSRO	Oil Spill Response Organisation
OVID	Offshore Vessel Inspection Database
OVSMA	Offshore Vessel Safety Management System Assessment
PBA	Pre-emptive Baseline Areas
PFCs	Perfluorocarbon
pH	Power of hydrogen
PV	Pipelay Vessel
PLET	Pipeline End Termination
PM10	Particulate matter less than 10 microns
PMST	Protected Matters Search Tool
ppm	Parts Per Million
PS	Performance Standards
RCC	Rescue Coordination Centre
RIV	Rock Installation Vessel
RO	Reverse Osmosis
ROV	Remotely Operated Vehicle
SBP	Sub Bottom Profiler
SEEP	Ship Energy Efficiency Management Plan
SF6	Sulphur hexafluoride
SIMAP	Spill Impact Mapping and Analysis Program
SMPEP	Spill Monitoring Programme Execution Plan
SO ₂	Sulphur dioxide
SOLAS	Safety of Life at Sea
SOPEP	Ship Oil Pollution Emergency Plan
SSCs	Suspension Sediment Concentrations
SSS	Side Scan Sonar
SWLB	Shallow Water Lay Barge
TAP	Marine Debris Threat Abatement Plan
TSHD	Trailing Suction Hopped Dredge
UCH	Underwater Cultural Heritage
UK	United Kingdom
US	United States
USBL	Ultra-short baseline
UWA	University of Western Australia
VOCs	Non-methane volatile organic compounds
WAF	Water Accommodated Fractions
WAMSI	Western Australian Marine Science Institution
WCC	Woodside Communication Centre

ZoMI	Zone of Moderate Impact
ZoHI	Zone of High Impact

APPENDIX A WOODSIDE POLICIES

WOODSIDE POLICY

Environment and Biodiversity Policy

OBJECTIVE

Woodside recognises the intrinsic value of nature and the importance of conserving biodiversity and ecosystem services to support the sustainable development of our society. We are committed to doing our part. We understand and embrace our responsibility to undertake activities in an environmentally sustainable way.

PRINCIPLES

Woodside commits to:

- Implementing a systematic approach to the management of the impacts and risks of our operating activities on an ongoing basis, including emissions and air quality, discharge and waste management, water management, biodiversity and protected areas.
- Applying the mitigation hierarchy principle (avoid, minimise, restore) and a continuous improvement approach to ensure we maintain compliance, improve resource use efficiency and reduce our environmental impacts.
- Embedding environmental and biodiversity management, and opportunities, in our business planning and decision making processes.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Not undertaking new exploration or development of hydrocarbons within the boundaries of natural sites on the UNESCO World Heritage List (as specified at 1 December 2022). Existing activity may continue if compatible with maintenance of the listed outstanding universal values.
- Not undertaking new exploration or development of hydrocarbons within IUCN Protected Areas (as specified at 1 December 2022) unless compatible with management plans in place for the area. Existing activity may continue if compatible with management plans in place for the area.
- Achieving net zero deforestation¹ associated with new projects that take a Final Investment Decision (FID) after 1 December 2022.
- Developing Biodiversity Action Plans for all new major projects (CAPEX >USD\$2 billion) that take a FID after 1 December 2022.
- Supporting positive biodiversity outcomes in regions and areas in which we operate.
- Setting targets and publicly reporting on our environmental and biodiversity performance.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Approved by the Woodside Energy Group Ltd Board in December 2022.

¹ Definition of Forest: 'trees higher than 5 meters and a canopy cover of more than 10 percent on the land to be cleared'

Health and Safety Policy

OBJECTIVES

At Woodside we believe that process and personal safety related incidents, and occupational illnesses are preventable. We strive to be an industry leader in health and safety and are committed to managing our activities to minimise adverse health and safety risk related impacts.

PRINCIPLES

Woodside will achieve this by:

- Implementing a systematic approach to health, personal safety, and process safety risk management.
- Maintaining a culture in which everybody is aware of their health and safety obligations and are empowered to speak up and intervene on health and safety issues.
- Identifying current and emerging hazards across the value chain activities to reduce risks to as low as reasonably practicable.
- Embedding health and safety management in our business planning and decision-making processes.
- Integrating health, personal safety and process safety requirements when designing, purchasing, constructing, and modifying equipment and facilities including requiring our contractors to comply with our HSE expectations in a mutually beneficial manner.
- Complying with relevant laws and regulations and applying responsible standards where laws do not exist.
- Setting targets and publicly reporting on our health and safety performance to help us continually improve.

APPLICABILITY

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside leaders are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

Revised by the Woodside Energy Group Ltd Board in December 2022

APPROVED

Risk Management Policy

OBJECTIVES

Woodside recognises that risk is inherent in our business and the effective management of risk is vital to deliver our strategic objectives, continued growth and success. We are committed to managing risks in a proactive and effective manner as a source of competitive advantage.

Our approach protects us against potential negative impacts, enables us to take risk for reward and improves our resilience against emerging risks. The objective of our risk management framework is to provide a single consolidated view of risks across the company to understand our full risk exposure and prioritise risk management and governance.

The success of our approach lies in the responsibility placed on everyone at all levels to proactively identify, assess and treat risks relating to the objectives they are accountable for delivering.

PRINCIPLES

Woodside achieves these objectives by:

- Applying a structured and comprehensive framework for the identification, assessment and treatment of current risks and response to emerging risks;
- Ensuring line of sight of financial and non-financial risks at appropriate levels of the organisation;
- Demonstrating leadership and commitment to integrating risk management into our business activities and governance practices;
- Recognising the value of stakeholder engagement, best available information and proactive identification of potential changes in external and internal context;
- Embedding risk management into our critical business processes and control framework;
- Understanding our exposure to risk and tolerance for uncertainty to inform our decision making and assure that Woodside is operating with due regard to the risk appetite endorsed by the Board; and
- Evaluating and improving the effectiveness and efficiency our approach.

APPLICABILITY

The Managing Director of Woodside is accountable to the Board of Directors for ensuring this Policy is effectively implemented.

Responsibility for the application of this Policy rests with all Woodside employees, contractors and joint venturers engaged in activities under Woodside operational control. Woodside managers are also responsible for promotion of this Policy in non-operated joint ventures.

This Policy will be reviewed regularly and updated as required.

APPENDIX B RELEVANT REQUIREMENTS

The below table refers to Commonwealth Legislation related to the activity

Commonwealth Legislation	Legislation Summary
<p><i>Air Navigation Act 1920</i></p> <ul style="list-style-type: none"> • Air Navigation Regulations 1947 • Air Navigation (Aerodrome Flight Corridors) Regulations 1994 • Air Navigation (Aircraft Engine Emissions) Regulations 1995 • Air Navigation (Aircraft Noise) Regulations 1984 • Air Navigation (Fuel Spillage) Regulations 1999 	<p>This Act relates to the management of air navigation.</p>
<p><i>Australian Maritime Safety Authority Act 1990</i></p>	<p>This Act establishes a legal framework for the Australian Maritime Safety Authority (AMSA), which represents the Australian Government and international forums in the development, implementation and enforcement of international standards including those governing ship safety and marine environment protection. AMSA is responsible for administering the Marine Orders in Commonwealth waters.</p>
<p><i>Australian Radiation Protection and Nuclear Safety Act 1998</i></p>	<p>This Act relates to the protection of the health and safety of people, and the protection of the environment from the harmful effects of radiation.</p>
<p><i>Biosecurity Act 2015</i></p> <ul style="list-style-type: none"> • Quarantine Regulations 2000 • Biosecurity Regulation 2016 • Australian Ballast Water Management Requirements 2017 	<p>This Act provides the Commonwealth with powers to take measures of quarantine, and implement related programs as are necessary, to prevent the introduction of any plant, animal, organism or matter that could contain anything that could threaten Australia’s native flora and fauna or natural environment. The Commonwealth’s powers include powers of entry, seizure, detention and disposal.</p> <p>This Act includes mandatory controls on the use of seawater as ballast in ships and the declaration of sea vessels voyaging out of and into Commonwealth waters. The Regulations stipulate that all information regarding the voyage of the vessel and the ballast water is declared correctly to the quarantine officers.</p>
<p><i>Environment Protection and Biodiversity Conservation Act 1999</i></p> <ul style="list-style-type: none"> • Environment Protection and Biodiversity Conservation Regulations 2000 	<p>This Act protects matters of national environmental significance (NES). It streamlines the national environmental assessment and approvals process, protects Australian biodiversity and integrates management of important natural and culturally significant places.</p> <p>Under this Act, actions that may be likely to have a significant impact on matters of NES must be referred to the Commonwealth Environment Minister.</p>
<p><i>Environment Protection (Sea Dumping) Act 1981</i></p> <ul style="list-style-type: none"> • Environment Protection (Sea Dumping) Regulations 1983 	<p>This Act provides for the protection of the environment by regulating dumping matter into the sea, incineration of waste at sea and placement of artificial reefs.</p>

Commonwealth Legislation	Legislation Summary
<p><i>Protection of the Sea (Powers of Intervention) Act 1981</i></p>	<p>This Act authorises the Commonwealth to take measures for the purpose of protecting the sea from pollution by oil and other noxious substances discharged from ships and provides legal immunity for persons acting under an AMSA direction.</p>
<p><i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i> <i>Protection of the Sea (Prevention of Pollution from Ships) (Orders) Regulations 1994</i></p> <ul style="list-style-type: none"> • Marine order 91 - Marine pollution prevention—oil • Marine order 93 - Marine pollution prevention—noxious liquid substances • Marine order 94 - Marine pollution prevention—packaged harmful substances • Marine order 95 - Marine pollution prevention—garbage • Marine order 96 - Marine pollution prevention—sewage <p><i>Maritime Legislation Amendment (Prevention of Air Pollution from Ships) Act 2007</i> MARPOL Convention</p>	<p>This Act relates to the protection of the sea from pollution by oil and other harmful substances discharged from ships. Under this Act, discharge of oil or other harmful substances from ships into the sea is an offence. There is also a requirement to keep records of the ships dealing with such substances.</p> <p>The Act applies to all Australian ships, regardless of their location. It applies to foreign ships operating between 3 nautical miles (nm) off the coast out to the end of the Australian Exclusive Economic Zone (200 nm). It also applies within the 3 nm of the coast where the State/Northern Territory does not have complementary legislation.</p> <p>All the Marine Orders listed, except for Marine Order 95, are enacted under both the <i>Navigation Act 2012</i> and the <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i>.</p> <p>This Act is an amendment to the <i>Protection of the Sea (Prevention of Pollution from Ships) Act 1983</i>. This amended Act provides the protection of the sea from pollution by oil and other harmful substances discharged from ships.</p>
<p><i>Protection of the Sea (Harmful Antifouling Systems) Act 2006</i></p> <ul style="list-style-type: none"> • Marine order 98—(Marine pollution—anti-fouling systems) 	<p>This Act relates to the protection of the sea from the effects of harmful anti-fouling systems. It prohibits the application or reapplication of harmful anti-fouling compounds on Australian ships or foreign ships that are in an Australian shipping facility.</p>
<p><i>Aboriginal and Torres Strait Islander Heritage Protection Act 1984</i></p>	<p>The Act seeks “to preserve and protect places, areas and objects of particular significance” to Aboriginal people. Under the Section 9 and 10 provisions of the Act, the Minister for the Environment may declare significant Aboriginal areas temporarily or permanently protected if they are considered under threat. Similar declarations regarding Aboriginal objects can be made under Section 12.</p> <p>Under Section 22 of the Act, the contravention of any of these declarations is an offence. Additionally, the discovery of any Aboriginal remains must be reported to the Minister under Section 20.</p> <p>Damage or interference with Aboriginal objects or places is not an offence under the ATSIHP Act except within Victoria under Section 21U.</p>
<p><i>Underwater Cultural Heritage Act 2018</i></p> <ul style="list-style-type: none"> • Underwater Cultural Heritage Guidance for Offshore Developments • DRAFT Guidelines to Protect Underwater Cultural Heritage 	<p>The Act prescribes penalties for damage to protected underwater cultural heritage without a permit under Section 30 or in contravention of a permit under Section 28. Protected underwater cultural heritage is prescribed in Section 16 to automatically include the remains and associated artefacts of any vessel or aircraft that has been in Australian waters for 75 years, whether known or unknown. This protection is also extended to underwater cultural heritage in Commonwealth waters specified by the Environment Minister under Section 17. Without a declaration under this section, Aboriginal underwater cultural heritage is not protected under the UCH Act.</p>

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	2
National Heritage Places:	3
Wetlands of International Importance (Ramsar)	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	2
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	65
Listed Migratory Species:	70

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Lamna nasus Porbeagle, Mackerel Shark [83288]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mobula alfredi as Manta alfredi Reef Manta Ray, Coastal Manta Ray [90033]		Species or species habitat known to occur within area
Mobula birostris as Manta birostris Giant Manta Ray [90034]		Species or species habitat known to occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Orcaella heinsohni Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pristis clavata Dwarf Sawfish, Queensland Sawfish [68447]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Pristis pristis Freshwater Sawfish, Largetooth Sawfish, River Sawfish, Leichhardt's Sawfish, Northern Sawfish [60756]	Vulnerable	Species or species habitat likely to occur within area
Pristis zijsron Green Sawfish, Dindagubba, Narrowsnout Sawfish [68442]	Vulnerable	Species or species habitat known to occur within area
Rhincodon typus Whale Shark [66680]	Vulnerable	Foraging, feeding or related behaviour known to occur within area
Sousa sahalensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Migratory Terrestrial Species		
Hirundo rustica Barn Swallow [662]		Species or species habitat may occur within area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area
Migratory Wetlands Species		
Actitis hypoleucos Common Sandpiper [59309]		Species or species habitat known to occur within area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area
Thalasseus bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area

Commonwealth Lands

[\[Resource Information \]](#)

The Commonwealth area listed below may indicate the presence of Commonwealth land in this vicinity. Due to the unreliability of the data source, all proposals should be checked as to whether it impacts on a Commonwealth area, before making a definitive decision. Contact the State or Territory government land department for further information.

Fork-tailed Swift [678]

Species or species habitat likely to occur within area overfly marine area

Scientific Name	Threatened Category	Presence Text
Ardenna carneipes as Puffinus carneipes Flesh-footed Shearwater, Fleshy-footed Shearwater [82404]		Foraging, feeding or related behaviour likely to occur within area
Ardenna pacifica as Puffinus pacificus Wedge-tailed Shearwater [84292]		Breeding known to occur within area
Bubulcus ibis as Ardea ibis Cattle Egret [66521]		Species or species habitat may occur within area overfly marine area
Calidris acuminata Sharp-tailed Sandpiper [874]		Species or species habitat known to occur within area
Calidris canutus Red Knot, Knot [855]	Endangered	Species or species habitat known to occur within area overfly marine area
Calidris ferruginea Curlew Sandpiper [856]	Critically Endangered	Species or species habitat known to occur within area overfly marine area
Calidris melanotos Pectoral Sandpiper [858]		Species or species habitat may occur within area overfly marine area
Calonectris leucomelas Streaked Shearwater [1077]		Species or species habitat likely to occur within area
Chalcites osculans as Chrysococcyx osculans Black-eared Cuckoo [83425]		Species or species habitat known to occur within area overfly marine area
Charadrius leschenaultii Greater Sand Plover, Large Sand Plover [877]	Vulnerable	Species or species habitat known to occur within area

Scientific Name	Threatened Category	Presence Text
Charadrius veredus Oriental Plover, Oriental Dotterel [882]		Species or species habitat may occur within area overfly marine area
Chroicocephalus novaehollandiae as Larus novaehollandiae Silver Gull [82326]		Breeding known to occur within area
Diomedea amsterdamensis Amsterdam Albatross [64405]	Endangered	Species or species habitat likely to occur within area
Diomedea exulans Wandering Albatross [89223]	Vulnerable	Species or species habitat may occur within area
Fregata ariel Lesser Frigatebird, Least Frigatebird [1012]		Breeding known to occur within area
Fregata minor Great Frigatebird, Greater Frigatebird [1013]		Species or species habitat may occur within area
Glareola maldivarum Oriental Pratincole [840]		Species or species habitat may occur within area overfly marine area
Haliaeetus leucogaster White-bellied Sea-Eagle [943]		Species or species habitat known to occur within area
Hirundo rustica Barn Swallow [662]		Species or species habitat may occur within area overfly marine area
Hydroprogne caspia as Sterna caspia Caspian Tern [808]		Breeding known to occur within area
Larus pacificus Pacific Gull [811]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Limnodromus semipalmatus Asian Dowitcher [843]		Species or species habitat known to occur within area overfly marine area
Limosa lapponica Bar-tailed Godwit [844]		Species or species habitat known to occur within area
Macronectes giganteus Southern Giant-Petrel, Southern Giant Petrel [1060]	Endangered	Species or species habitat may occur within area
Macronectes halli Northern Giant Petrel [1061]	Vulnerable	Species or species habitat may occur within area
Merops ornatus Rainbow Bee-eater [670]		Species or species habitat may occur within area overfly marine area
Motacilla cinerea Grey Wagtail [642]		Species or species habitat may occur within area overfly marine area
Motacilla flava Yellow Wagtail [644]		Species or species habitat may occur within area overfly marine area
Numenius madagascariensis Eastern Curlew, Far Eastern Curlew [847]	Critically Endangered	Species or species habitat known to occur within area
Onychoprion anaethetus as Sterna anaethetus Bridled Tern [82845]		Breeding known to occur within area
Onychoprion fuscatus as Sterna fuscata Sooty Tern [90682]		Breeding known to occur within area
Pandion haliaetus Osprey [952]		Breeding known to occur within area

Scientific Name	Threatened Category	Presence Text
Papasula abbotti Abbott's Booby [59297]	Endangered	Species or species habitat may occur within area
Phaethon lepturus White-tailed Tropicbird [1014]		Species or species habitat known to occur within area
Phaethon lepturus fulvus Christmas Island White-tailed Tropicbird, Golden Bosunbird [26021]	Endangered	Species or species habitat may occur within area
Pterodroma mollis Soft-plumaged Petrel [1036]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Rostratula australis as Rostratula benghalensis (sensu lato) Australian Painted Snipe [77037]	Endangered	Species or species habitat likely to occur within area overfly marine area
Stercorarius skua as Catharacta skua Great Skua [823]		Species or species habitat may occur within area
Sterna dougallii Roseate Tern [817]		Breeding known to occur within area
Sternula albifrons as Sterna albifrons Little Tern [82849]		Species or species habitat may occur within area
Sternula nereis as Sterna nereis Fairy Tern [82949]		Breeding known to occur within area
Sula dactylatra Masked Booby [1021]		Breeding known to occur within area
Sula leucogaster Brown Booby [1022]		Breeding known to occur within area
Thalassarche carteri Indian Yellow-nosed Albatross [64464]	Vulnerable	Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Thalassarche cauta Shy Albatross [89224]	Endangered	Species or species habitat may occur within area
Thalassarche impavida Campbell Albatross, Campbell Black-browed Albatross [64459]	Vulnerable	Species or species habitat may occur within area
Thalassarche melanophris Black-browed Albatross [66472]	Vulnerable	Species or species habitat may occur within area
Thalassarche steadi White-capped Albatross [64462]	Vulnerable	Species or species habitat may occur within area
Thalasseus bengalensis as Sterna bengalensis Lesser Crested Tern [66546]		Breeding known to occur within area
Thalasseus bergii as Sterna bergii Greater Crested Tern [83000]		Breeding known to occur within area
Tringa nebularia Common Greenshank, Greenshank [832]		Species or species habitat likely to occur within area overfly marine area
Fish		
Acentronura larsonae Helen's Pygmy Pipehorse [66186]		Species or species habitat may occur within area
Bulbonaricus brauni Braun's Pughead Pipefish, Pug-headed Pipefish [66189]		Species or species habitat may occur within area
Campichthys galei Gale's Pipefish [66191]		Species or species habitat may occur within area
Campichthys tricarinatus Three-keel Pipefish [66192]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Choeroichthys brachysoma Pacific Short-bodied Pipefish, Short-bodied Pipefish [66194]		Species or species habitat may occur within area
Choeroichthys latispinosus Muiron Island Pipefish [66196]		Species or species habitat may occur within area
Choeroichthys suillus Pig-snouted Pipefish [66198]		Species or species habitat may occur within area
Corythoichthys flavofasciatus Reticulate Pipefish, Yellow-banded Pipefish, Network Pipefish [66200]		Species or species habitat may occur within area
Cosmocampus banneri Roughridge Pipefish [66206]		Species or species habitat may occur within area
Doryrhamphus dactyliophorus Banded Pipefish, Ringed Pipefish [66210]		Species or species habitat may occur within area
Doryrhamphus excisus Bluestripe Pipefish, Indian Blue-stripe Pipefish, Pacific Blue-stripe Pipefish [66211]		Species or species habitat may occur within area
Doryrhamphus janssi Cleaner Pipefish, Janss' Pipefish [66212]		Species or species habitat may occur within area
Doryrhamphus multiannulatus Many-banded Pipefish [66717]		Species or species habitat may occur within area
Doryrhamphus negrosensis Flagtail Pipefish, Masthead Island Pipefish [66213]		Species or species habitat may occur within area
Festucalex scalaris Ladder Pipefish [66216]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Filicampus tigris Tiger Pipefish [66217]		Species or species habitat may occur within area
Halicampus brocki Brock's Pipefish [66219]		Species or species habitat may occur within area
Halicampus grayi Mud Pipefish, Gray's Pipefish [66221]		Species or species habitat may occur within area
Halicampus nitidus Glittering Pipefish [66224]		Species or species habitat may occur within area
Halicampus spinostris Spiny-snout Pipefish [66225]		Species or species habitat may occur within area
Haliichthys taeniophorus Ribboned Pipehorse, Ribboned Seadragon [66226]		Species or species habitat may occur within area
Hippichthys penicillus Beady Pipefish, Steep-nosed Pipefish [66231]		Species or species habitat may occur within area
Hippocampus angustus Western Spiny Seahorse, Narrow-bellied Seahorse [66234]		Species or species habitat may occur within area
Hippocampus histrix Spiny Seahorse, Thorny Seahorse [66236]		Species or species habitat may occur within area
Hippocampus kuda Spotted Seahorse, Yellow Seahorse [66237]		Species or species habitat may occur within area
Hippocampus planifrons Flat-face Seahorse [66238]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hippocampus spinosissimus Hedgehog Seahorse [66239]		Species or species habitat may occur within area
Hippocampus trimaculatus Three-spot Seahorse, Low-crowned Seahorse, Flat-faced Seahorse [66720]		Species or species habitat may occur within area
Lissocampus fatiloquus Prophet's Pipefish [66250]		Species or species habitat may occur within area
Micrognathus micronotopterus Tidepool Pipefish [66255]		Species or species habitat may occur within area
Nannocampus subosseus Bonyhead Pipefish, Bony-headed Pipefish [66264]		Species or species habitat may occur within area
Phoxocampus belcheri Black Rock Pipefish [66719]		Species or species habitat may occur within area
Solegnathus hardwickii Pallid Pipehorse, Hardwick's Pipehorse [66272]		Species or species habitat may occur within area
Solegnathus lettiensis Gunther's Pipehorse, Indonesian Pipefish [66273]		Species or species habitat may occur within area
Solenostomus cyanopterus Robust Ghostpipefish, Blue-finned Ghost Pipefish, [66183]		Species or species habitat may occur within area
Stigmatopora argus Spotted Pipefish, Gulf Pipefish, Peacock Pipefish [66276]		Species or species habitat may occur within area
Syngnathoides biaculeatus Double-end Pipehorse, Double-ended Pipehorse, Alligator Pipefish [66279]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Trachyrhamphus bicoarctatus Bentstick Pipefish, Bend Stick Pipefish, Short-tailed Pipefish [66280]		Species or species habitat may occur within area
Trachyrhamphus longirostris Straightstick Pipefish, Long-nosed Pipefish, Straight Stick Pipefish [66281]		Species or species habitat may occur within area
Mammal		
Dugong dugon Dugong [28]		Breeding known to occur within area
Reptile		
Acalyptophis peronii Horned Seasnake [1114]		Species or species habitat may occur within area
Aipysurus apraefrontalis Short-nosed Seasnake [1115]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus duboisii Dubois' Seasnake [1116]		Species or species habitat may occur within area
Aipysurus eydouxii Spine-tailed Seasnake [1117]		Species or species habitat may occur within area
Aipysurus foliosquama Leaf-scaled Seasnake [1118]	Critically Endangered	Species or species habitat known to occur within area
Aipysurus laevis Olive Seasnake [1120]		Species or species habitat may occur within area
Aipysurus pooleorum Shark Bay Seasnake [66061]		Species or species habitat may occur within area
Aipysurus tenuis Brown-lined Seasnake [1121]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Astrotia stokesii Stokes' Seasnake [1122]		Species or species habitat may occur within area
Caretta caretta Loggerhead Turtle [1763]	Endangered	Breeding known to occur within area
Chelonia mydas Green Turtle [1765]	Vulnerable	Breeding known to occur within area
Chitulia ornata as Hydrophis ornatus Spotted Seasnake, Ornate Reef Seasnake [87377]		Species or species habitat may occur within area
Dermochelys coriacea Leatherback Turtle, Leathery Turtle, Luth [1768]	Endangered	Foraging, feeding or related behaviour known to occur within area
Disteira kingii Spectacled Seasnake [1123]		Species or species habitat may occur within area
Disteira major Olive-headed Seasnake [1124]		Species or species habitat may occur within area
Emydocephalus annulatus Turtle-headed Seasnake [1125]		Species or species habitat may occur within area
Ephalophis greyi North-western Mangrove Seasnake [1127]		Species or species habitat may occur within area
Eretmochelys imbricata Hawksbill Turtle [1766]	Vulnerable	Breeding known to occur within area
Hydrelaps darwiniensis Black-ringed Seasnake [1100]		Species or species habitat may occur within area
Hydrophis elegans Elegant Seasnake [1104]		Species or species habitat may occur within area

Scientific Name	Threatened Category	Presence Text
Hydrophis macdowelli as Hydrophis mcdowelli Small-headed Seasnake [75601]		Species or species habitat may occur within area
Leioselasma czeblukovi as Hydrophis czeblukovi Fine-spined Seasnake, Geometrical Seasnake [87374]		Species or species habitat may occur within area
Natator depressus Flatback Turtle [59257]	Vulnerable	Breeding known to occur within area
Pelamis platurus Yellow-bellied Seasnake [1091]		Species or species habitat may occur within area

Whales and Other Cetaceans [[Resource Information](#)]

Current Scientific Name	Status	Type of Presence
Mammal		
Balaenoptera acutorostrata Minke Whale [33]		Species or species habitat may occur within area
Balaenoptera bonaerensis Antarctic Minke Whale, Dark-shoulder Minke Whale [67812]		Species or species habitat likely to occur within area
Balaenoptera borealis Sei Whale [34]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area
Balaenoptera edeni Bryde's Whale [35]		Species or species habitat likely to occur within area
Balaenoptera musculus Blue Whale [36]	Endangered	Migration route known to occur within area
Balaenoptera physalus Fin Whale [37]	Vulnerable	Foraging, feeding or related behaviour likely to occur within area

Current Scientific Name	Status	Type of Presence
Delphinus delphis Common Dolphin, Short-beaked Common Dolphin [60]		Species or species habitat may occur within area
Eubalaena australis Southern Right Whale [40]	Endangered	Species or species habitat likely to occur within area
Feresa attenuata Pygmy Killer Whale [61]		Species or species habitat may occur within area
Globicephala macrorhynchus Short-finned Pilot Whale [62]		Species or species habitat may occur within area
Grampus griseus Risso's Dolphin, Grampus [64]		Species or species habitat may occur within area
Indopacetus pacificus Longman's Beaked Whale [72]		Species or species habitat may occur within area
Kogia breviceps Pygmy Sperm Whale [57]		Species or species habitat may occur within area
Kogia sima as Kogia simus Dwarf Sperm Whale [85043]		Species or species habitat may occur within area
Lagenodelphis hosei Fraser's Dolphin, Sarawak Dolphin [41]		Species or species habitat may occur within area
Megaptera novaeangliae Humpback Whale [38]		Breeding known to occur within area
Mesoplodon densirostris Blainville's Beaked Whale, Dense- beaked Whale [74]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Mesoplodon ginkgodens Gingko-toothed Beaked Whale, Gingko-toothed Whale, Gingko Beaked Whale [59564]		Species or species habitat may occur within area
Mesoplodon grayi Gray's Beaked Whale, Scamperdown Whale [75]		Species or species habitat may occur within area
Orcaella heinsohni as Orcaella brevirostris Australian Snubfin Dolphin [81322]		Species or species habitat known to occur within area
Orcinus orca Killer Whale, Orca [46]		Species or species habitat may occur within area
Peponocephala electra Melon-headed Whale [47]		Species or species habitat may occur within area
Physeter macrocephalus Sperm Whale [59]		Species or species habitat may occur within area
Pseudorca crassidens False Killer Whale [48]		Species or species habitat likely to occur within area
Sousa sahalensis as Sousa chinensis Australian Humpback Dolphin [87942]		Species or species habitat known to occur within area
Stenella attenuata Spotted Dolphin, Pantropical Spotted Dolphin [51]		Species or species habitat may occur within area
Stenella coeruleoalba Striped Dolphin, Euphrosyne Dolphin [52]		Species or species habitat may occur within area
Stenella longirostris Long-snouted Spinner Dolphin [29]		Species or species habitat may occur within area

Current Scientific Name	Status	Type of Presence
Steno bredanensis Rough-toothed Dolphin [30]		Species or species habitat may occur within area
Tursiops aduncus Indian Ocean Bottlenose Dolphin, Spotted Bottlenose Dolphin [68418]		Species or species habitat likely to occur within area
Tursiops aduncus (Arafura/Timor Sea populations) Spotted Bottlenose Dolphin (Arafura/Timor Sea populations) [78900]		Species or species habitat known to occur within area
Tursiops truncatus s. str. Bottlenose Dolphin [68417]		Species or species habitat may occur within area
Ziphius cavirostris Cuvier's Beaked Whale, Goose-beaked Whale [56]		Species or species habitat may occur within area

Key Ecological Features

[[Resource Information](#)]

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Canyons linking the Cuvier Abyssal Plain and the Cape Range Peninsula	North-west
Commonwealth waters adjacent to Ningaloo Reef	North-west
Continental Slope Demersal Fish Communities	North-west
Exmouth Plateau	North-west
Glomar Shoals	North-west
Wallaby Saddle	North-west
Western demersal slope and associated fish communities	South-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Dugong		
Dugong dugon		
Dugong [28]	Breeding	Known to occur

Scientific Name	Behaviour	Presence
Dugong dugon Dugong [28]	Calving	Known to occur
Dugong dugon Dugong [28]	Foraging (high density seagrass beds)	Known to occur
Dugong dugon Dugong [28]	Nursing	Known to occur
Marine Turtles		
Caretta caretta Loggerhead Turtle [1763]	Foraging	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Caretta caretta Loggerhead Turtle [1763]	Nesting	Known to occur
Chelonia mydas Green Turtle [1765]	Aggregation	Known to occur
Chelonia mydas Green Turtle [1765]	Basking	Known to occur
Chelonia mydas Green Turtle [1765]	Foraging	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting	Known to occur
Chelonia mydas Green Turtle [1765]	Internesting buffer	Known to occur
Chelonia mydas Green Turtle [1765]	Mating	Known to occur
Chelonia mydas Green Turtle [1765]	Migration corridor	Known to occur

Scientific Name	Behaviour	Presence
Chelonia mydas Green Turtle [1765]	Nesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Foraging	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Mating	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Migration corridor	Known to occur
Eretmochelys imbricata Hawksbill Turtle [1766]	Nesting	Known to occur
Natator depressus Flatback Turtle [59257]	Aggregation	Known to occur
Natator depressus Flatback Turtle [59257]	Foraging	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting	Known to occur
Natator depressus Flatback Turtle [59257]	Internesting buffer	Known to occur
Natator depressus Flatback Turtle [59257]	Mating	Known to occur
Natator depressus Flatback Turtle [59257]	Migration corridor	Known to occur
Natator depressus Flatback Turtle [59257]	Nesting	Known to occur

Seabirds

Scientific Name	Behaviour	Presence
Ardena pacifica Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Fregata ariel Lesser Frigatebird [1012]	Breeding	Known to occur
Onychoprion fuscata Sooty Tern [82847]	Foraging	Known to occur
Sterna dougallii Roseate Tern [817]	Breeding	Known to occur
Sternula nereis Fairy Tern [82949]	Breeding	Known to occur
Sula leucogaster Brown Booby [1022]	Breeding	Known to occur
Thalasseus bengalensis Lesser Crested Tern [66546]	Breeding	Known to occur
Sharks		
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Rhincodon typus Whale Shark [66680]	Foraging (high density prey)	Known to occur
Whales		
Balaenoptera musculus brevipinna Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevipinna Pygmy Blue Whale [81317]	Foraging	Known to occur
Balaenoptera musculus brevipinna Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur

Scientific Name	Behaviour	Presence
Megaptera novaeangliae		
Humpback Whale [38]	Resting	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EPBC Act Protected Matters Report

This report provides general guidance on matters of national environmental significance and other matters protected by the EPBC Act in the area you have selected. Please see the caveat for interpretation of information provided here.

Operational Area

Report created: 27-Mar-2023

Summary

Matters of National Environment Significance

This part of the report summarises the matters of national environmental significance that may occur in, or may relate to, the area you nominated. Further information is available in the detail part of the report, which can be accessed by scrolling or following the links below. If you are proposing to undertake an activity that may have a significant impact on one or more matters of national environmental significance then you should consider the [Administrative Guidelines on Significance](#).

World Heritage Properties:	None
National Heritage Places:	None
Wetlands of International Importance (Ramsar)	None
Great Barrier Reef Marine Park:	None
Commonwealth Marine Area:	1
Listed Threatened Ecological Communities:	None
Listed Threatened Species:	24
Listed Migratory Species:	42

Other Matters Protected by the EPBC Act

This part of the report summarises other matters protected under the Act that may relate to the area you nominated. Approval may be required for a proposed activity that significantly affects the environment on Commonwealth land, when the action is outside the Commonwealth land, or the environment anywhere when the action is taken on Commonwealth land. Approval may also be required for the Commonwealth or Commonwealth agencies proposing to take an action that is likely to have a significant impact on the environment anywhere.

The EPBC Act protects the environment on Commonwealth land, the environment from the actions taken on Commonwealth land, and the environment from actions taken by Commonwealth agencies. As heritage values of a place are part of the 'environment', these aspects of the EPBC Act protect the Commonwealth Heritage values of a Commonwealth Heritage place. Information on the new heritage laws can be found at <https://www.dcceew.gov.au/parks-heritage/heritage>

A [permit](#) may be required for activities in or on a Commonwealth area that may affect a member of a listed threatened species or ecological community, a member of a listed migratory species, whales and other cetaceans, or a member of a listed marine species.

Commonwealth Lands:	None
Commonwealth Heritage Places:	None
Listed Marine Species:	74
Whales and Other Cetaceans:	29
Critical Habitats:	None
Commonwealth Reserves Terrestrial:	None
Australian Marine Parks:	2
Habitat Critical to the Survival of Marine Turtles:	3

Extra Information

This part of the report provides information that may also be relevant to the area you have

State and Territory Reserves:	None
Regional Forest Agreements:	None
Nationally Important Wetlands:	None
EPBC Act Referrals:	56
Key Ecological Features (Marine):	3
Biologically Important Areas:	11

Key Ecological Features [\[Resource Information \]](#)

Key Ecological Features are the parts of the marine ecosystem that are considered to be important for the biodiversity or ecosystem functioning and integrity of the Commonwealth Marine Area.

Name	Region
Ancient coastline at 125 m depth contour	North-west
Continental Slope Demersal Fish Communities	North-west
Exmouth Plateau	North-west

Biologically Important Areas

Scientific Name	Behaviour	Presence
Marine Turtles		
Caretta caretta		
Loggerhead Turtle [1763]	Internesting buffer	Known to occur
Chelonia mydas		
Green Turtle [1765]	Internesting buffer	Known to occur
Eretmochelys imbricata		
Hawksbill Turtle [1766]	Internesting buffer	Known to occur
Natator depressus		
Flatback Turtle [59257]	Internesting buffer	Known to occur
Seabirds		
Ardenna pacifica		
Wedge-tailed Shearwater [84292]	Breeding	Known to occur
Sterna dougallii		
Roseate Tern [817]	Breeding	Known to occur
Sternula nereis		
Fairy Tern [82949]	Breeding	Known to occur

Sharks

Scientific Name	Behaviour	Presence
Rhincodon typus Whale Shark [66680]	Foraging	Known to occur
Whales		
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Distribution	Known to occur
Balaenoptera musculus brevicauda Pygmy Blue Whale [81317]	Migration	Known to occur
Megaptera novaeangliae Humpback Whale [38]	Migration (north and south)	Known to occur

Caveat

1 PURPOSE

This report is designed to assist in identifying the location of matters of national environmental significance (MNES) and other matters protected by the Environment Protection and Biodiversity Conservation Act 1999 (Cth) (EPBC Act) which may be relevant in determining obligations and requirements under the EPBC Act.

The report contains the mapped locations of:

- World and National Heritage properties;
- Wetlands of International and National Importance;
- Commonwealth and State/Territory reserves;
- distribution of listed threatened, migratory and marine species;
- listed threatened ecological communities; and
- other information that may be useful as an indicator of potential habitat value.

2 DISCLAIMER

This report is not intended to be exhaustive and should only be relied upon as a general guide as mapped data is not available for all species or ecological communities listed under the EPBC Act (see below). Persons seeking to use the information contained in this report to inform the referral of a proposed action under the EPBC Act should consider the limitations noted below and whether additional information is required to determine the existence and location of MNES and other protected matters.

Where data are available to inform the mapping of protected species, the presence type (e.g. known, likely or may occur) that can be determined from the data is indicated in general terms. It is the responsibility of any person using or relying on the information in this report to ensure that it is suitable for the circumstances of any proposed use. The Commonwealth cannot accept responsibility for the consequences of any use of the report or any part thereof. To the maximum extent allowed under governing law, the Commonwealth will not be liable for any loss or damage that may be occasioned directly or indirectly through the use of, or reliance

3 DATA SOURCES

Threatened ecological communities

For threatened ecological communities where the distribution is well known, maps are generated based on information contained in recovery plans, State vegetation maps and remote sensing imagery and other sources. Where threatened ecological community distributions are less well known, existing vegetation maps and point location data are used to produce indicative distribution maps.

Threatened, migratory and marine species

Threatened, migratory and marine species distributions have been discerned through a variety of methods. Where distributions are well known and if time permits, distributions are inferred from either thematic spatial data (i.e. vegetation, soils, geology, elevation, aspect, terrain, etc.) together with point locations and described habitat; or modelled (MAXENT or BIOCLIM habitat modelling) using

Where little information is available for a species or large number of maps are required in a short time-frame, maps are derived either from 0.04 or 0.02 decimal degree cells; by an automated process using polygon capture techniques (static two kilometre grid cells, alpha-hull and convex hull); or captured manually or by using topographic features (national park boundaries, islands, etc.).

In the early stages of the distribution mapping process (1999-early 2000s) distributions were defined by degree blocks, 100K or 250K map sheets to rapidly create distribution maps. More detailed distribution mapping methods are used to update these distributions

4 LIMITATIONS

The following species and ecological communities have not been mapped and do not appear in this report:

- threatened species listed as extinct or considered vagrants;
- some recently listed species and ecological communities;
- some listed migratory and listed marine species, which are not listed as threatened species; and
- migratory species that are very widespread, vagrant, or only occur in Australia in small numbers.

The following groups have been mapped, but may not cover the complete distribution of the species:

- listed migratory and/or listed marine seabirds, which are not listed as threatened, have only been mapped for recorded
- seals which have only been mapped for breeding sites near the Australian continent

The breeding sites may be important for the protection of the Commonwealth Marine environment.

Refer to the metadata for the feature group (using the Resource Information link) for the currency of the information.

EXECUTIVE SUMMARY

Woodside Energy Scarborough Pty Ltd (Woodside) has developed its oil spill preparedness and response position for the Scarborough Seabed Intervention and Trunkline Installation, hereafter known as the Petroleum Activities Program (PAP) techniques. This document demonstrates the risks and impacts from an unplanned hydrocarbon release, and the associated response operations, are controlled to As Low as Reasonably Practicable (ALARP) and Acceptable levels. It achieves this by evaluating response options to address the potential environmental impacts resulting from an unplanned loss of hydrocarbon containment associated with the PAP described in the Environment Plan (EP).

This document then outlines Woodside’s decisions and techniques for responding to a hydrocarbon release event and the process for determining its level of hydrocarbon spill preparedness. A summary of the key facts and references to additional detail within this document are presented below.

Table 0-1: Summary of the key details for assessment

Key details of assessment	Summary	Reference to additional detail
Worst Case Credible Scenario	<p>Credible Scenario-01 (CS-01): A short-term (instantaneous) surface release of 2000 m³ of marine diesel from a vessel collision outside Mermaid Sound.</p> <p>Credible Scenario-02 (CS-02): A short-term (instantaneous) surface release of 2000 m³ of marine diesel from a vessel collision within Montebello Marine Park.</p> <p>Credible Scenario-03 (CS-03): A short-term (instantaneous) surface release of 2000 m³ of marine diesel from a vessel collision in the Scarborough field (at the proposed Floating Production Unit (FPU) location).</p>	Section 2.2
Hydrocarbon Properties	<p>Under constant 5 kn wind conditions approximately 45% of the oil is predicted to evaporate within 24 hours. The majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes.</p> <p>Under variable wind conditions where winds are of a greater strength, more entrainment of oil into the water column is predicted (about 45% after 24 hours). A further 35% is forecast to evaporate, leaving only a small proportion of the oil floating on the water surface (<1%).</p>	Section 6.7.2 of the EP Appendix A of the First Strike Plan
Modelling Results	<p>A quantitative, stochastic assessment has been undertaken for credible spill scenarios to help assess the environmental risk of a hydrocarbon spill. 1 INTRODUCTION

1.1 Overview

Woodside Energy Scarborough Pty Ltd (Woodside) has developed its oil spill preparedness and response position for the Scarborough Seabed Intervention and Trunkline Installation activity, hereafter known as the Petroleum Activities Program (PAP). This document outlines Woodside's decisions and techniques for responding to a hydrocarbon loss of containment event and the process for determining its level of hydrocarbon spill preparedness.

1.2 Purpose

This document, together with the documents listed below, meet the requirements of the *Offshore Petroleum and Greenhouse Gas Storage (Environment) Regulations 2009* (OPGGS Environment Regulations) relating to hydrocarbon spill response arrangements.

- The Scarborough Seabed Intervention and Trunkline Installation Environment Plan (EP)
- Oil Pollution Emergency Arrangements (OPEA) (Australia)
- The Scarborough Seabed Intervention and Trunkline Installation Oil Pollution Emergency Plan (OPEP) including
 - First Strike Response Plan
 - Relevant Operations Plans
 - Relevant Tactical Response Plans ([TRPs](#), also see [ANNEX E](#))
 - Relevant Supporting Plans
 - Data Directory

The purpose of this document is to demonstrate that the risks and impacts from an unplanned hydrocarbon release and the associated response operations are controlled to As Low as Reasonably Practicable (ALARP) and Acceptable levels.

1.3 Scope

This document demonstrates that the risks and impacts from an unplanned hydrocarbon release, and the associated response operations, are controlled to ALARP and Acceptable levels. It achieves this by evaluating response options to address the potential environmental risks and impacts resulting from an unplanned loss of hydrocarbon containment associated with the PAP described in the EP. This content of this document then outlines Woodside's decisions and techniques for responding to a hydrocarbon release event and the process for determining its level of hydrocarbon spill preparedness. It should be read in conjunction with the documents listed in Table 1-1. The location of the Petroleum Activity Program (PAP) is shown in Figure 3-2 of the EP.

1.4 Oil spill response document overview

The documents outlined in Table 1-1 and Figure 1-1 are collectively used to manage the preparedness and response for a hydrocarbon release.

The Oil Pollution First Strike Plan (FSP) contains a pre-operational Net Environmental Benefit Analysis (NEBA) summary, outlining the selected response techniques for this PAP. Relevant Operational Plans to be initiated for associated response techniques are identified in the FSP and relevant forms to initiate a response are appended to the FSP.

The process to develop an Incident Action Plan (IAP) begins once the Oil Pollution FSP is underway. The IAP includes inputs from the Monitor and Evaluate (ME) operations and the operational NEBA (Section 4). Planning, coordination and resource management are initiated by the Incident

Management Team (IMT). In some instances, technical specialists may be utilised to provide expert advice. The planning may also involve liaison officers from supporting government agencies.

During each operational period, field reports are continually reviewed to evaluate the effectiveness of response operations. In addition, the operational NEBA is continually reviewed and updated to ensure the response techniques implemented continue to result in a net environmental benefit (see **Section 4**).

The response will continue as described in **Section 5** until the response termination criteria have been met, as set out in **ANNEX B: Operational Monitoring Activation and Termination Criteria**.

2 RESPONSE PLANNING PROCESS

This document details Woodside's process for identifying potential response options for the hydrocarbon release scenarios, identified in the EP. Figure 2-1 outlines the interaction between Woodside's response, planning/preparedness and selection process.

This structure has been used because it shows how the planning and preparedness activities inform a response and provides indicative guidance on what activities would be undertaken, in sequential order, if a real event were to occur. The process also evaluates alternative, additional and/or improved control measures specific to the PAP.

The Scarborough Seabed Intervention and Trunkline Installation First Strike Response Plan then summarises the outcome of the response planning process and provides initial response guidance and a summary of ongoing response activities, if an incident were to occur.

2.1 Response planning process outline

This document is expanded below to provide additional context on the key steps in determining capability, evaluating ALARP and hydrocarbon spill response requirements.

- Section 1. INTRODUCTION
- Section 2. RESPONSE PLANNING PROCESS
 - Identification of worst-case credible scenario(s) (WCCS)
 - Spill modelling for WCCS.
- Section 3. IDENTIFY RESPONSE PROTECTION AREAS (RPAs)
 - Areas predicted to be contacted at concentration $>100 \text{ g/m}^2$ ¹.
- Section 4. NET ENVIRONMENTAL BENEFIT ANALYSIS (NEBA)
 - Pre-operational NEBA (during planning/ALARP evaluation): this must be reviewed during the initial response to an incident to ensure its accuracy
 - Selected response techniques prioritised and carried forward for ALARP assessment.
- Section 5. HYDROCARBON SPILL ALARP PROCESS
 - Determines the response need based on predicted consequence parameters.
 - Details the environmental performance of the selected response options based on the need.
 - Sets the environmental performance outcomes, environmental performance standards and measurement criteria.
- Section 6. ALARP EVALUATION
 - Evaluates alternative, additional, and improved options for each response technique to demonstrate the risk has been reduced to ALARP.
 - Provides a detailed ALARP assessment of selected control measure options against:
 - predicted cost associated with implementing the option
 - predicted change to environmental benefit
 - predicted effectiveness / feasibility of the control measure.
- Section 7. ENVIRONMENTAL RISK ASSESSMENT OF SELECTED RESPONSE TECHNIQUES
 - Evaluation of impacts and risks from implementing selected response options.
- Section 8. ALARP CONCLUSION
- Section 9. ACCEPTABILITY CONCLUSION

¹ This represents the threshold that could impact the survival and reproductive capacity of benthic epifaunal invertebrates living in intertidal habitat.

2.1.1 Response planning assumptions – timing, resourcing and effectiveness

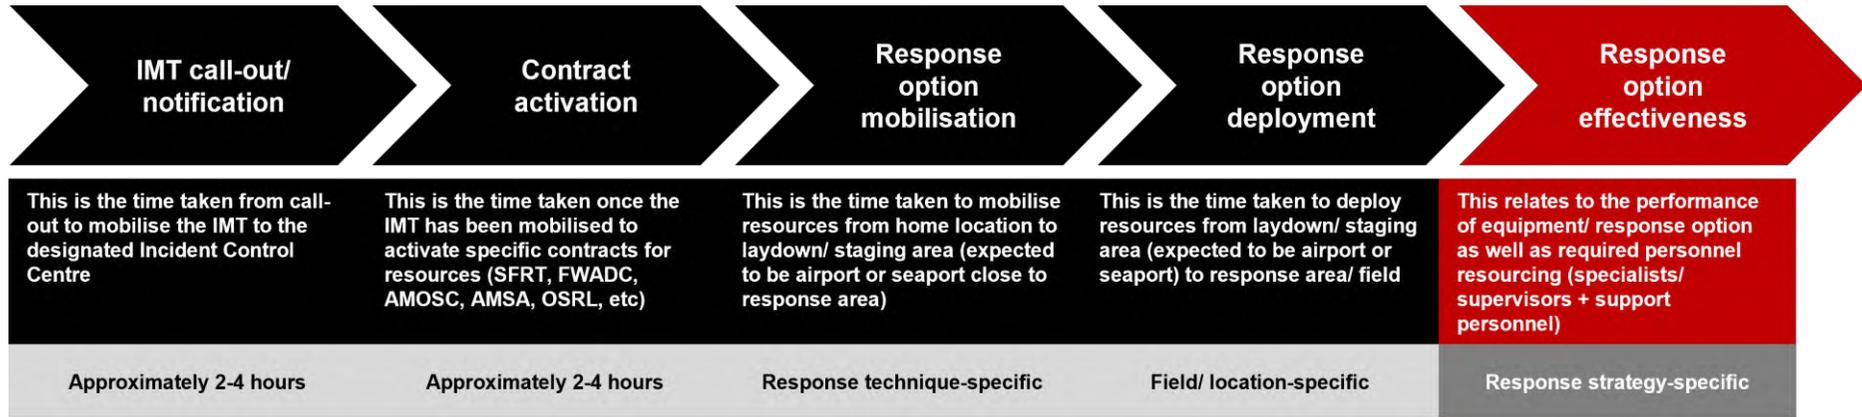

Figure 2-2: Response Planning Assumptions – Timing, Resourcing and Effectiveness

2.2 Environment plan risk assessment (credible spill scenarios)

Potential hydrocarbon release scenarios from the PAP have been identified during the risk assessment process (Section 6 of the EP). Further descriptions of risk, impacts and mitigation measures (which are not related to hydrocarbon preparedness and response) are provided in Section 6 of the EP. Three unplanned events or credible spill scenarios for the PAP have been selected as representative across types, sources and incident/response levels, up to and including the WCCS.

Table 2-1 presents the credible scenarios for the PAP. The WCCS for the activity is then used for response planning purposes, as all other scenarios are of a lesser scale and extent. By demonstrating capability to manage the response to the WCCS, Woodside assumes other scenarios that are smaller in nature and scale can also be managed by the same capability. Response performance measures have been defined based on a response to the WCCS.

Stochastic modelling has been completed for a worst case spill scenario of an instantaneous surface release of 2000 m³ of marine diesel, the volume of the largest single fuel tank. The modelling results are representing loss of vessel fuel tank integrity after a collision, at three locations: outside Mermaid Sound (CS-01), within Montebello Marine Park (CS-02) and at the proposed Floating Production Unit (FPU) location in the Scarborough field (CS-03). The surface release of marine diesel caused by vessel collision (CS-01, CS-02 or CS-03) has been considered for response planning purposes, given the large volume released instantaneously. Marine fuel loss during bunkering (CS-04) has a significantly smaller marine diesel release volume of a maximum of 55 m³, based on a 15 min delay to shut off pumps and a maximum transfer rate of 220 m³/h, Hydraulic fluid loss of up to 8 m³ from hydraulically actuated equipment (Scenario 5) is also considered credible. Both a 55 m³ bunkering spill and 8 m³ hydraulic fluid spill are considered to be within the risk profile and spill response capability requirements of CS-01, CS-02 or CS-03.

Table 2-1: Petroleum Activities Program credible spill scenarios

Scenario	Scenario selected for planning purposes	Scenario description	Maximum credible volume released (liquid m ³)	Incident Level	Hydrocarbon (HC) type	Residual proportion	Residual volume (liquid m ³)
CS-01	Yes	Short-term (instantaneous) surface release of marine diesel after a vessel collision outside Mermaid Sound.	2000	2	Marine Diesel	5.0 %	100
CS-02	Yes	Short-term (instantaneous) surface release of marine diesel after a vessel collision within Montebello Marine Park.	2000	2	Marine Diesel	5.0 %	100
CS-03	Yes	Short-term (instantaneous) surface release of marine diesel after a vessel collision at the FPU location in the Scarborough field.	2000	2	Marine Diesel	5.0 %	100
CS-04	No	Marine fuel loss during bunkering: Short-term (instantaneous) release of marine diesel	55	1	Marine Diesel	5.0 %	2.75
CS-05	No	Loss of containment from hydraulic systems of hydraulically actuated equipment	8	1	Hydraulic Fluid	5.0 %	0.4

2.2.1 Hydrocarbon characteristics

Marine Diesel (API 37.2 by the American Petroleum Institute)

Marine Diesel Oil is typically classed as an International Tanker Owners Federation (ITOPF) Group I/II oil.

Marine diesel is a mixture of volatile and persistent hydrocarbons with low proportions of highly volatile and residual components. Under constant 5 kn wind conditions, approximately 45% of the oil is predicted to evaporate within 24 hours. Under these calm conditions the majority of the remaining oil on the water surface will weather at a slower rate due to being comprised of the longer-chain compounds with higher boiling points. Evaporation of the residual compounds will slow significantly, and they will then be subject to more gradual decay through biological and photochemical processes. Under variable wind conditions where winds are of a greater strength, more entrainment of oil into the water column is predicted (about 45% after 24 hours). A further 35% is forecast to evaporate, leaving only a small proportion of the oil floating on the water surface (<1%).

The heavier (low volatility) components of the oil have a tendency to entrain into the upper water column due to wind-generated waves but can subsequently resurface if wind-waves abate. Therefore, the heavier components of this oil can remain entrained or on the sea surface for an extended period, with associated potential for dissolution of the soluble aromatic fraction.

2.3 Hydrocarbon spill modelling

Oil spill trajectory modelling tools are used for environmental impact assessment and during response planning to understand spatial scale and timeframes for response operations. Woodside recognises there is a degree of uncertainty related to the use of modelling data and has subsequently utilised conservative approaches to volumes, weathering, spatial areas, timing and response effectiveness to scale capability to need.

The Oil Spill Model and Response System (OILMAP) and Integrated Oil Spill Impact Model System (Spill Impact Mapping and Analysis Program, SIMAP) models are both used for stochastic and deterministic trajectory modelling. They have been developed over three decades of planning, exercises, actual responses, several peer reviews, and validation studies. OILMAP was originally derived from the United States Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) Type A model (French et al. 1996), for assessing marine transport, biological impact and economic impact that was also used under the United States Oil Pollution Act 1990 Natural Resource Damage Assessment (NRDA) regulations. Notable spills where the model has been used and validated against actual field observations include, Exxon Valdez (French McCay 2004), North Cape Oil Spill (French McCay 2003), along with an assessment of 20 other spills (French McCay and Rowe, 2004). In addition, test spills designed to verify fate, weathering and movement algorithms have been conducted regularly and in a range of climate conditions (French and Rines 1997; French et al. 1997; Payne et al. 2007; French McCay et al. 2007).

Further to this, the algorithms have been updated using the latest findings from the Macondo/Deepwater Horizon well blowout in the Gulf of Mexico and validated according to the Deepwater Horizon (DWH) oil spill in support of the Natural Resource Damage Assessment (NRDA) (Spaulding et al. 2015; French McCay et al. 2015, 2016).

Finally, the OILMAP and SIMAP models have been used extensively in Australia to prosecute pollution offences, predict discharge locations and likely spill volumes based on weathering and surveillance observations, and has been used as expert witness evidence in Australian court proceedings, aiding the prosecution to determine spill quantum estimates.

2.3.1 Stochastic modelling

Stochastic modelling has been completed for the following scenarios outlined in **Table 2-1**. CS-01: A short-term (instantaneous) surface release of 2000 m³ of marine diesel, representing loss of vessel fuel tank integrity after a collision outside Mermaid Sound, CS-02: A short-term (instantaneous) surface release of 2000 m³ of marine diesel, representing loss of vessel fuel tank integrity after a collision within Montebello Marine Park (MP) and CS-03: A short-term (instantaneous) surface release of 2000 m³ of marine diesel, representing loss of vessel fuel tank integrity after a collision at the FPU location in the Scarborough field. A quantitative, stochastic assessment has been undertaken for credible spill scenarios to help assess the environmental consequences of a hydrocarbon spill.

Numerous simulations (100-200) were completed to test for trends and variations in the trajectory and weathering of the spilled oil, with an even number of replicates completed using samples of metocean data that commenced within each calendar quarter. Further details relating to the assessments for the scenario can be found in Section 6 of the EP.

2.3.1.1 Environmental impact thresholds – EMBA and hydrocarbon exposure

The outputs of the stochastic spill modelling are used to assess the potential environmental impact from the credible scenarios. The stochastic modelling results are used to delineate areas of the marine and shoreline environment that could be exposed to hydrocarbon levels exceeding environmental impact threshold concentrations. The summary of all the locations where hydrocarbon thresholds could be exceeded by any of the simulations modelled is defined as Environment that May Be Affected (EMBA) and is discussed further in Section 6 of the EP. As the weathering of

different fates of hydrocarbons (surface, entrained and dissolved) differs due to the influence of the metocean mechanism of transportation, a different EMBA is presented for each fate within the EP.

A conservative approach – adopting accepted contact thresholds for impacts on the marine environment – is used to define the EMBA. These hydrocarbon thresholds are presented in **Table 2-2** below and described in Section 6 of the EP.

Table 2-2: Summary of thresholds applied to the stochastic hydrocarbon spill modelling to determine the EMBA and environmental impacts

Threshold Scarborough Seabed Intervention and Trunkline Installation	Description
10 g/m ²	Surface hydrocarbon
100 ppb	Entrained hydrocarbon (ppb)
50 ppb	Dissolved aromatic hydrocarbon (ppb)
100 g/m ²	Shoreline accumulation

2.3.2 Deterministic modelling

Woodside uses deterministic modelling results to evaluate risks and impacts and response capability requirements. These results are provided in both shapefile and data table format with each row of the data table representing a 1 km² cell. This cell size has been used as it represents the approximate area that a single containment and recovery operation or surface dispersant operation (single sortie or vessel spraying) can effectively treat in one ten (10) hour day. Smaller cell sizes have been considered but would not change the response need as the potential distance between cells would not allow multiple cells to be treated per day by response operations. Additionally, a 1km² cell is expected to allow averaging of threshold concentrations and mass across the spatial extent to represent a conservative approach (patches of oil and windrows) to response planning that simulates operational monitoring feedback in a real event.

The deterministic modelling data provides an indication of the response need by displaying the potential surface area and volume that may be treated or recovered by response operations. Existing capability is reviewed to approximate the surface area and volumes that can be treated or removed and a range of alternate, improved and additional options to reduce risks and impacts to as low as reasonably practical (ALARP) are considered.

Woodside recognises that no single response technique will treat all available subsea or surface oil and that a combination of response techniques will be required for the identified scenario. Even with the significant resources available to Woodside through existing capability and third-party resources, the primary offshore response techniques of surface dispersant application and containment and recovery will only treat or recover a minor proportion (<30%) of the available surface hydrocarbons based on previous response experience.

Woodside is committed to a realistic, scalable response capability that is commensurate to the level of risk and able to be practically implemented and feasibly sustained.

2.3.3 Response planning thresholds for surface and shoreline hydrocarbon exposure

Thresholds to determine the EMBA are used to predict and assess environmental impacts and inform the scientific monitoring program (SMP), however, they do not appropriately represent the thresholds at which an effective response can be implemented. Additional response thresholds are used for response planning and to determine areas where response techniques would be most effective. The deterministic modelling is then used to assess the nature and scale of a response.

In the event of an actual response, existing deterministic modelling would be reviewed for suitability and additional modelling would be conducted using real-time data and field information to inform Incident Management Team decisions.

The deterministic spill modelling outputs are presented at response planning thresholds for surface hydrocarbons for the WCCS. Surface spill concentrations are expressed as grams per square metre (g/m²) (Section 2.2). The thresholds used are derived from oil spill response planning literature and industry guidance and are summarised below.

2.3.4 Surface hydrocarbon concentrations

Table 2-3: Surface hydrocarbon thresholds for response planning

Surface hydrocarbon concentration (g/m ²)	Description	Bonn Agreement Oil Appearance Code (BAOAC)	Mass per area (g/m ²)
>10	Predicted minimum threshold for commencing operational monitoring ²	Code 3 – Dull metallic colour	5 to 50
50	Predicted minimum floating oil threshold for containment and recovery and surface dispersant application ³	Code 4 – Discontinuous true oil colour	50 to 200
100	Predicted optimum floating oil threshold for containment and recovery and surface dispersant application	Code 5 – Continuous true oil colour	>200
Shoreline hydrocarbon concentration (g/m ²)	Description	National Plan Guidance on Oil Contaminated Foreshores	Mass per area (g/m ²)
100	Predicted minimum shoreline accumulation threshold for shoreline assessment operations	Stain	>100
250	Predicted minimum threshold for commencing shoreline clean-up operations	Level 3 - Thin Coating	200 to 1000

The surface thickness of oil at which dispersants are typically effective is approximately 100 g/m². However, substantial variations occur in the thickness of the oil within the slick, and most fresh crude oils spread within a few hours, so overall the average thickness is 0.1 mm (or approx. 100 g/m²) (International Tanker Owners Pollution Federation [ITOPF] 2011). Additionally, the recommended rate of application for surface dispersant is typically 1-part dispersant to 20 or 25 parts of spilled oil. These figures assume a 0.1 mm slick thickness, averaged over the thickest part of the spill, to calculate a litres/hectare application rate from vessels and aircraft. In practice, this can be difficult to achieve as it is not possible to accurately assess the thickness of the floating oil.

Some degree of localised over-dosage and under-dosage is inevitable in dispersant response. An average oil layer thickness of 0.1 mm is often assumed, although the actual thickness can vary over a wide range (from less than 0.0001 mm to more than 1 mm) over short distances (International Petroleum Industry Environment Conservation Association [IPIECA] 2015).

Guidance from Australian Maritime Safety Authority (AMSA, 2015) indicates spreading of spills of Group II or III products will rapidly decrease slick thickness over the first 24 hours of a spill resulting in the potential requirement of up to a ten (10) fold increase in capability on day 2 to achieve the same level of performance.

Further guidance from the European Maritime Safety Authority (EMSA) states spraying the ‘metallic’ looking area of an oil slick (Bonn Agreement Oil Appearance Code [BAOAC] 3, approx. 5 – 50 µm)

² Operational monitoring will be undertaken from the outset of a spill whether or not the minimum threshold has been reached. This is needed to assess the nature of the spill and track its location. This will then inform the need for any additional monitoring and/or response techniques.

³ At 50 g/m², containment and recovery and surface dispersant application operations are not expected to be particularly effective. This threshold represents a conservative approach to planning response capability and containing the spread of surface oil.

with dispersant from spraying gear designed to treat an oil layer 0.1 mm (100 µm) thick, will inevitably cause dispersant over-treatment by a factor of 2 to 20 times (EMSA 2012).

Therefore, dispersant application should be concentrated on the thickest areas of an oil slick and Woodside intends on applying surface dispersants to only BAOAC 4 and 5. Spraying areas of oil designated as BAOAC Code 4 (Discontinuous true oil colour) with dispersant will, on average, deliver approximately the recommended treatment rate of dispersant.

Spraying areas of oil designated as BAOAC Code 5 with dispersant (Continuous true oil colour and more than 0.2 mm thick) will, on average, deliver approximately half the recommended treatment rate of dispersant. Repeated application of these areas of thicker oil, or increased dosage ratios, will be required to achieve the recommended treatment rate of dispersant (EMSA 2012).

Guidance from the National Oceanic and Atmospheric Administration (NOAA) in the United States is found in the document: *Characteristics of Response Techniques: A Guide for Spill Response Planning in Marine Environments 2013* (NOAA 2013).

This guide outlines advice for response planning across all common techniques, including surface dispersant spraying and containment and recovery. It states oil thickness can vary by orders of magnitude within distinct areas of a slick, thus the actual slick thickness and oil distribution of target areas are crucial for determining response method feasibility. Further to this, ITOPF also states in terms of oil spill response, sheen can be disregarded as it represents a negligible quantity of oil, cannot be recovered or otherwise dealt with to a significant degree by existing response techniques, and is likely to dissipate readily and naturally (ITOPF, 2014).

Figure 2-3 below from AMSA's Identification of Oil on Water – Aerial Observation and Identification Guide (AMSA, 2014) shows expected percent coverage of surface hydrocarbons as a proportion of total surface area. Wind-rows, heavy oil patches and tar balls, for example, must be considered, as they influence oil encounter rates, chemical dosages and ignition potential. Each method has different thickness thresholds for effective response.

From this information and other relevant sources (Allen and Dale, 1996, EMSA, 2012, Spence, 2018) the surface threshold of 50 g/m² was chosen as an average / equilibrium thickness (50 g/m² is an average is 50% coverage of 0.1 mm Bonn Agreement Code 4 - discontinuous true oil colour, or 25% coverage of 0.2 mm Bonn Agreement Code 5 – continuous true oil colour which would represent small patches of thick oil or wind-rows.

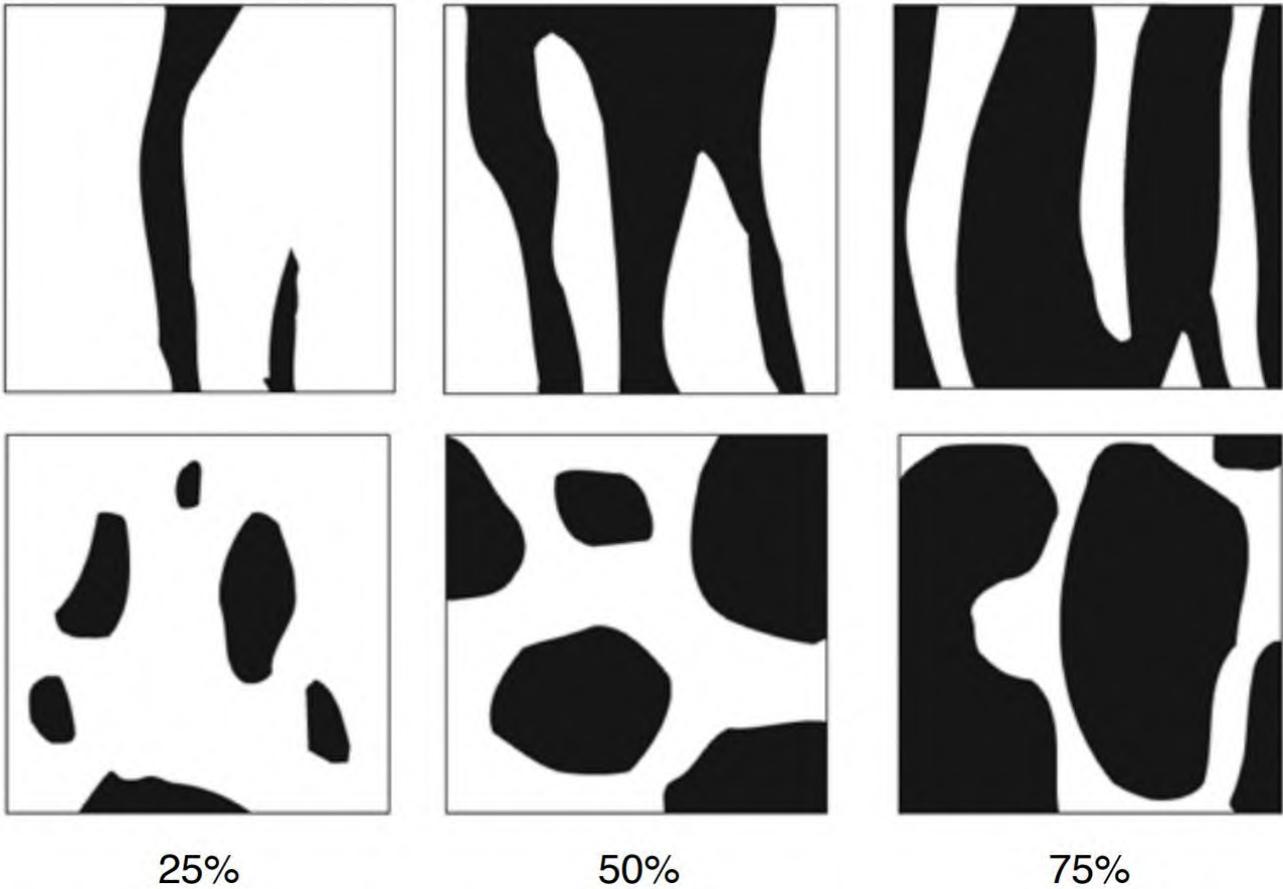

Figure 2-3: Proportion of total area coverage (AMSA, 2014)

Figure 2-4 illustrates the general relationships between on-water response techniques and slick thickness. Windrows, heavy oil patches and tar balls, for example, must be considered, as they influence oil encounter rates, chemical dosages and ignition potential. Each method has different thickness thresholds for effective response.

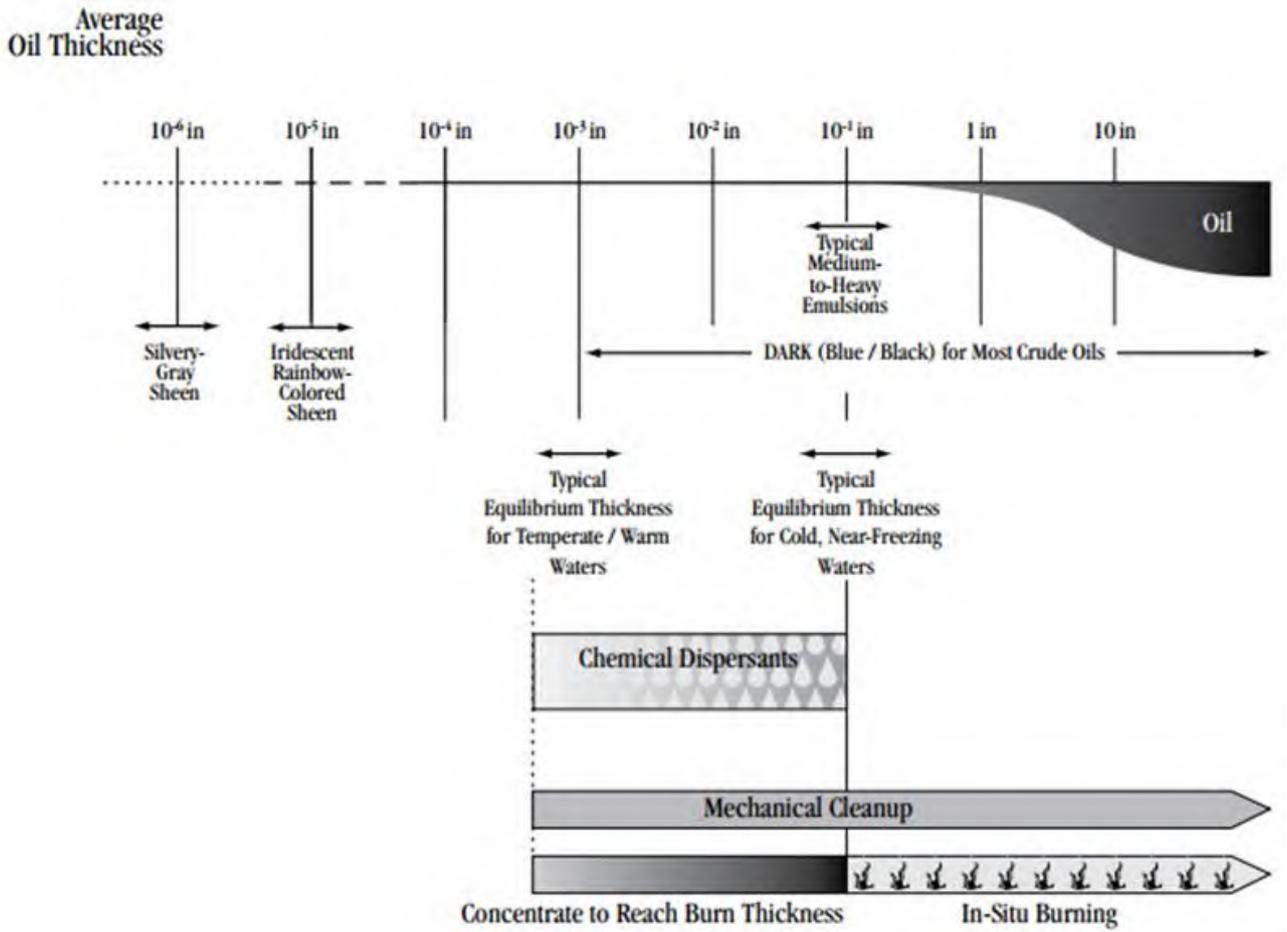

Figure 2-4: Oil thickness versus potential response options (from Allen & Dale 1996)

Wind and waves influence the feasibility of mechanical clean-up operations, dropping the effectiveness significantly because of entrainment and/or splash-over as short period waves develop beyond two to three feet (0.6–0.9 m) in height. Waves and wind can also be limiting factors for the safe operation of vessels and aircraft. There is also potential secondary contamination of unimpacted areas and waste issues associated with mechanical dispersion of slicks (Table 4-3 and Section 4.2.3.3).

2.3.4.1 Surface hydrocarbon viscosity

Table 2-4: Surface hydrocarbon viscosity thresholds

Surface viscosity (cSt)	Description	European Maritime Safety Authority (EMSA)	Viscosity at sea temperature (cSt)
5,000	Predicted optimum viscosity for surface dispersant operations	Generally possible to disperse	500-5000
10,000	Predicted maximum viscosity for effective surface dispersant operations	Sometimes possible to disperse	5,000-10,000

Further to the required thickness for surface dispersant application and containment and recovery to be deployed effectively as outlined above, changes to viscosity will also limit the treatment of offshore response techniques. As outlined in the EMSA Manual on the Applicability of Oil Spill Dispersants (EMSA, 2012), guidance around changes to viscosity and likely effectiveness of surface dispersant application is provided.

This includes the following statements;” It has been known for many years that it is more difficult to disperse a high viscosity oil than a low or medium viscosity oil. Laboratory testing had shown that the effectiveness of dispersants is related to oil viscosity, being highest for modern “Concentrate, UK Type 2/3” dispersants at an oil viscosity of about 1000 or 2000 mPa.s (1000 – 2000 cSt) and then declining to a low level with an oil viscosity of 10,000 mPa.s (10,000 cSt). It was considered that some generally applicable viscosity limit, such as 2000 or 5000 mPa.s (2000 – 5000 cSt), could be applied to all oils.”

However, modern oil spill dispersants are generally effective up to an oil viscosity of 5000 mPa.s (5000 cSt) or more, and their performance gradually decreases with increasing viscosity; oils with a viscosity of more than 10,000 are, in most cases, no longer dispersible. Guidance from the Centre of Documentation, Research and Experimentation (CEDRE; EMSA, 2012) also indicates products with a range of 500 – 5000 cSt at sea temperature are generally possible to disperse, while 5000 – 10,000 cSt at sea temperature above pour point are sometimes possible to disperse, with products beyond 10,000 cSt at sea temperature below pour point are generally impossible to disperse. The potential use of dispersants is evaluated in **Table 4-3**.

To support decision making and response planning, a threshold of 10,000 cSt at sea temperature was chosen as a conservative estimate of maximum viscosity for surface dispersant spraying operations.

The thresholds described above are compared with the modelling results for the WCCS (**Table 2-5**).

2.3.5 Spill modelling results

Details of the credible scenarios and modelling inputs are included along with deterministic results in **Table 2-5**. Modelling was conducted for all scenarios with three different model outputs being used to determine the worst-case credible parameters. CS-01 provided the WCCS for the shortest time for any oil to drift from the source to both the offshore boundary of a sensitive receptor and to the receptor shoreline, relative to the commencement of the spill.

The selected deterministic runs used to represent the WCCS are:

- Fastest time to shoreline contact (above 100 g/m²);
- Largest volume ashore at any single RPA (above 100 g/m²); and
- Largest volume ashore on all shorelines from a single model run (above 100 g/m²).

Both stochastic and deterministic modelling were completed for CS-01 and CS-02 (although no shoreline contact is predicted for CS-02). Stochastic modelling only was undertaken for CS-03. The deterministic modelling results presented below are therefore derived from the deterministic modelling for CS-01.

Table 2-5: Worst case credible scenario modelling results

Response parameter	Modelled result
	Marine diesel release caused by vessel collision
Maximum instantaneous liquid hydrocarbon release rate and duration	Worst case spill scenario of an instantaneous surface release of 2000 m ³ of marine diesel, representing loss of vessel fuel tank integrity after a collision: <ul style="list-style-type: none"> - Outside Mermaid Sound (Scenario 1) - Within Montebello Marine Park (Scenario 2) - In the Scarborough Field (FPU location) (Scenario 3)
Maximum residual surface hydrocarbon after weathering	100 m ³
Deterministic Modelling results	
Minimum time to commencement of hydrocarbon accumulation at any shoreline receptor (at a threshold of 100 g/m ²)	Surface release of Marine Diesel (CS-01) 2.2 days (53 hours) at Dampier Archipelago
Minimum time to floating hydrocarbon contact with the offshore edge(s) of any shoreline receptor polygon (at a threshold of 10 g/m ²)	Surface release of Marine Diesel (CS-01) 1.1 (27 hours) days at Dampier Archipelago
Maximum cumulative hydrocarbon volume accumulated at any individual shoreline receptor	Surface release of Marine Diesel (CS-01) 3 m ³ at Dampier Archipelago
Maximum cumulative hydrocarbon volume accumulated across all shoreline receptors contacted by accumulated hydrocarbons (including those contacted at <100 g/m ² accumulation concentration)	Surface release of Marine Diesel (CS-01) 156 g/m ² at Dampier Archipelago
Minimum time to entrained/dissolved hydrocarbon contact with the offshore edges of any receptor polygon (at a threshold of 100 ppb)	1 hour at Montebello Marine Park (CS-02) ⁴

From the above deterministic modelling results, the volumes and timeframes have been considered as the basis for response planning and are included in **Section 4.2**. Further stochastic modelling results for the three credible spill scenarios are summarised below.

CS-01 (outside Mermaid Sound):

- Surface hydrocarbon concentrations greater than 10 g/m² may occur up to 18 km from the release location.
- Floating oil at the 10 g/m² threshold is predicted to arrive at the surface waters of the Montebello MP with a probability of 100% after 1 hour, at the Dampier Archipelago receptor with a probability of 2% after 27 hours, at Dampier MP with a probability of 2% after 37 hours and at Gascoyne MP with a probability of 1% after 64 hours.
- Potential for accumulation of oil on shorelines is predicted to be low, with a maximum accumulated volume and concentration of 3 m³ and 156 g/m², respectively, forecast at the Dampier Archipelago.
- Shorelines accumulation greater than the 100 g/m² threshold is predicted to occur at Dampier Archipelago after 2.2 days with a maximum shoreline accumulation of 156 g/m².
- The Dampier Archipelago is predicted to be exposed to entrained hydrocarbons greater than 100 ppb within 14 days.

⁴ From stochastic modelling

- No other shoreline location exposed to entrained hydrocarbons greater than 100 ppb over timescales longer than 14 days are predicted to accumulate hydrocarbons >100 g/m².
- Numerous islands, banks, shoals and mainland locations may be exposed to entrained hydrocarbons greater than 100 ppb within 14 days.
- Spreading and weathering of the surface oil occurs rapidly due to the loss of light, volatile components and the spreading. Dispersant application and containment and recovery are not appropriate for use on spills of marine diesel due to these weathering characteristics.

CS-02 (Within Montebello MP):

- Surface hydrocarbons greater than the 10 g/m² threshold could potentially be found up to 39 km from the spill site. Given that this spill location lies within the Montebello AMP receptor area, floating oil at concentrations equal to or greater than 100 g/m² are forecast with a probability of 100%. Probabilities of floating oil contact at the 10 g/m² threshold not predicted for other receptors.
- Entrained oil at concentrations equal to or greater than the 100 ppb threshold is predicted to be found up to around 630 km from the spill site. The following receptors are predicted to receive entrained oil concentrations at the 100 ppb threshold with probabilities in parenthesis: Montebello Marine Park (78%), Muiron Islands Marine Management Area – World Heritage Area (MMA-WHA, 13%), Argo-Rowley Terrace MP (1%), Barrow Island (5%), Montebello Islands (8%), Ningaloo Coast (Middle, Middle WHA, North, North WHA, max. 12%), Ningaloo RUZ (12%), Pilbara Islands – Southern Island Group (5%), Rankin Bank (1%), Shark Bay (Open Coast and WHA, 1% and 1%, respectively), Bernier & Dorre Islands (1%), Lowendal Islands (1%), Montebello State Marine Park (13%), Muiron Islands (11%), Gascoyne Marine Park (11%) and WA Coastline (10%). The maximum entrained oil concentration is forecast as 156,954 ppb within the Montebello Marine Park.
- Dissolved aromatic hydrocarbons at concentrations equal to or greater than the 50 ppb threshold are predicted to be found up to around 216 km from the spill site. Barrow Island (probability 1%), Montebello Islands (probability 1%), Rankin Bank (probability 1%), Montebello Marine Park (probability 49%), Montebello State Marine Park (probability 1%) and the WA Coastline (probability 1%) are receptors predicted to receive dissolved aromatic hydrocarbon concentrations at the 50 ppb threshold. The maximum dissolved aromatic hydrocarbon concentration is forecast as 1990 ppb within the Montebello Marine Park.
- Accumulated hydrocarbons above threshold concentrations (≥ 100 g/m²) were not predicted by the modelling to occur.

CS-03 (In Scarborough field (FPU location)):

- Surface hydrocarbons equal to or greater than the 10 g/m² threshold could potentially be found up to 113 km from the spill site. No shoreline receptors are predicted to be contacted by surface hydrocarbons concentrations. Floating oil at the 10 g/m² threshold is predicted to arrive at the surface waters of the Gascoyne Marine Park receptor with a probability of 1% after 64 hours.
- Entrained oil at concentrations equal to or greater than the 100 ppb threshold is predicted to be found up to around 918 km from the spill site. The Gascoyne Marine Park, Carnarvon Canyon Marine Park and Abrolhos Islands Marine Park receptors are predicted to receive entrained oil concentrations at the 100 ppb threshold with a probability of 10%, 1% and 1%, respectively. The maximum entrained oil concentration is forecast as 7236 ppb within the Gascoyne Marine Park.
- Dissolved aromatic hydrocarbons at concentrations equal to or greater than the 50 ppb threshold are predicted to be found up to around 244 km from the spill site. The Gascoyne Marine Park is the only receptor predicted to receive dissolved aromatic hydrocarbon concentrations at the 50 ppb threshold with a probability of 3%. The maximum dissolved aromatic hydrocarbon concentration is forecast as 462 ppb within the Gascoyne Marine Park.

- Accumulated hydrocarbons above threshold concentrations ($\geq 100 \text{ g/m}^2$) were not predicted by the modelling to occur.

3 IDENTIFY RESPONSE PROTECTION AREAS (RPAs)

In a response, operational monitoring programs – including trajectory modelling and vessel/aerial observations – would be used to predict RPAs that may be impacted. For the purposes of planning and appropriately scaling a response, modelling has been used to identify RPAs as outlined below in **Figure 3-1**.

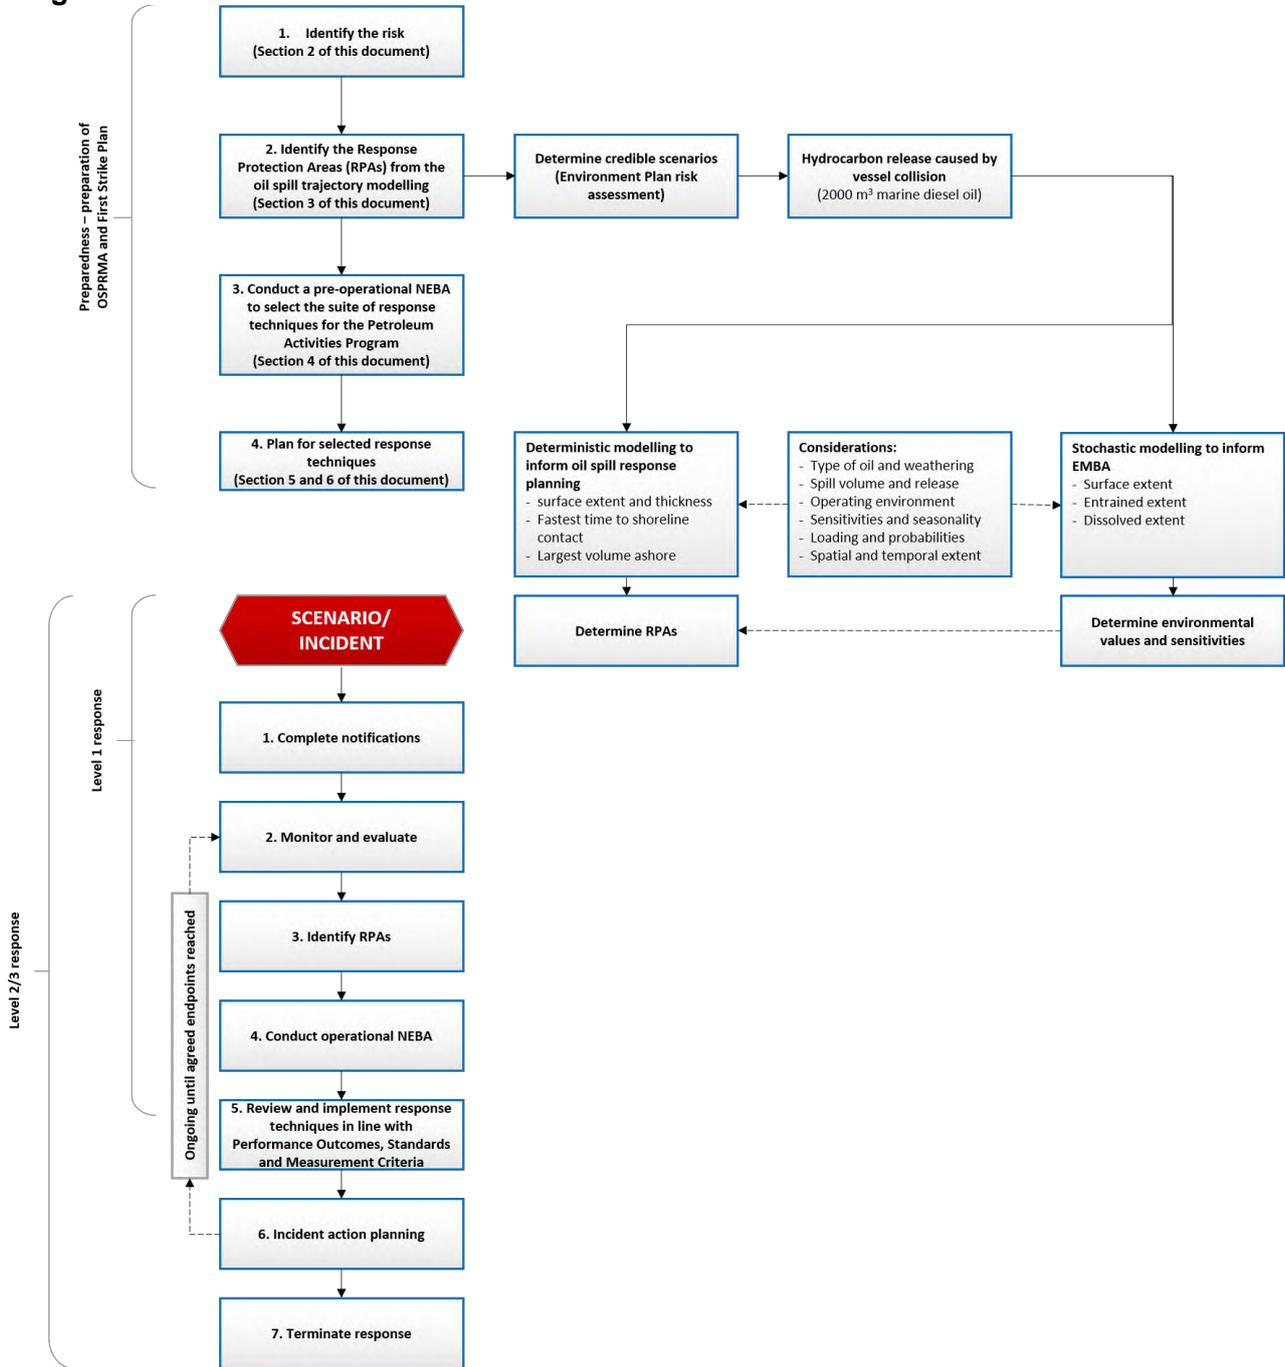

Figure 3-1: Identify Response Protection Areas (RPAs) flowchart

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

3.1 Identified sensitive receptor locations

Section 6 of the EP includes sensitive receptor locations have been identified by stochastic modelling as meeting the requirements outlined below:

- Receptors with the potential to incur surface, entrained or shoreline accumulation contact above environmental impact thresholds
- Receptors within the EMBA which meet the following:
 - A number of priority protection criteria/categories
 - International Union of Conservation of Nature (IUCN) marine protected area categories
 - High conservation value habitat and species
 - Important socio-economic/heritage value.

3.2 Identify Response Protection Areas (RPAs)

From the identified sensitive receptors described in Section 6 of the EP, only those for which a shoreline response could feasibly be conducted (accumulation > 100 g/m² for shoreline assessment and/or contact with surface slicks >10 g/m² for operational monitoring⁵) have been selected for response planning purposes.

3.2.1 Response Protection Areas (RPAs)

Response Protection Areas (RPAs) have been selected on the basis of their environmental ecological, social, economic, cultural and heritage values and sensitivities and the ability to conduct a response based on the minimum response thresholds (**Section 2.3.3**). It is important to note that the RPAs are determined from the combined results of the individual worst-case runs and do not indicate a single worst case credible scenario (where the timings and volumes are all expected from one release).

The only RPA identified for the PAP is the Dampier Archipelago.

During a spill event, operational monitoring (OM) techniques (OM01, OM02, OM03, OM04 and OM05) would be deployed from the outset of the spill to track the spill trajectory and deduce if any RPAs are at risk of impact. TRPs will be drafted in advance for any RPAs with a contact time of <14 days.

Any additional sensitive receptors are presented in the existing environment description (Section 4 of the EP) and impact assessment section (Section 6 of the EP) for the spill scenario. The pre-operational NEBA (**Section 4**) considers the results from the stochastic modelling to ensure all feasible response techniques are considered in the planning phase, therefore additional receptors are also included in the pre-operational NEBA.

⁵ Operational monitoring will be undertaken from the outset of a spill whether or not this threshold has been reached. Monitoring is needed throughout the response to assess the nature of the spill, track its location and inform the need for any additional monitoring and/or response techniques. It also informs when the spill has entered State Waters and/or control of the incident passes to statutory authorities e.g. WA DoT or AMSA.

Table 3-1: Response Protection Areas (RPAs)

Areas of coastline contacted	Conservation status	IUCN protection category	CS-01		CS-02		CS-03	
			Minimum time to shoreline contact (above 10 g/m ²) in days ⁽⁶⁾	Maximum shoreline accumulation (above 10 g/m ²) in m ³ ⁽⁷⁾	Minimum time to shoreline contact (above 10 g/m ²) in days ⁽⁵⁾	Maximum shoreline accumulation (above 10 g/m ²) in m ³ ⁽⁶⁾	Minimum time to shoreline contact (above 10 g/m ²) in days ⁽⁵⁾	Maximum shoreline accumulation (above 10 g/m ²) in m ³ ⁽⁶⁾
Dampier Archipelago	National Heritage Property	N/A	2.2 days	3 m ³	No shoreline contact above threshold predicted	No shoreline contact above threshold predicted	No shoreline contact above threshold predicted	No shoreline contact above threshold predicted

⁶ This volume and time represent the first time to contact on defined shoreline polygon and the maximum volume ashore for that 24 hour period.

⁷ This volume and time represent the maximum volume ashore on defined shoreline polygon for any 24 hour time period

4 NET ENVIRONMENTAL BENEFIT ANALYSIS (NEBA)

A Net Environmental Benefit Analysis (NEBA) is a structured process to consider which response techniques are likely to provide the greatest net environmental benefit. The NEBA process typically involves four key steps outlined in **Figure 4-1**: evaluate data, predict outcomes, balance trade-offs, and select response options. These steps are followed in the planning/preparedness process and would also be followed in a response.

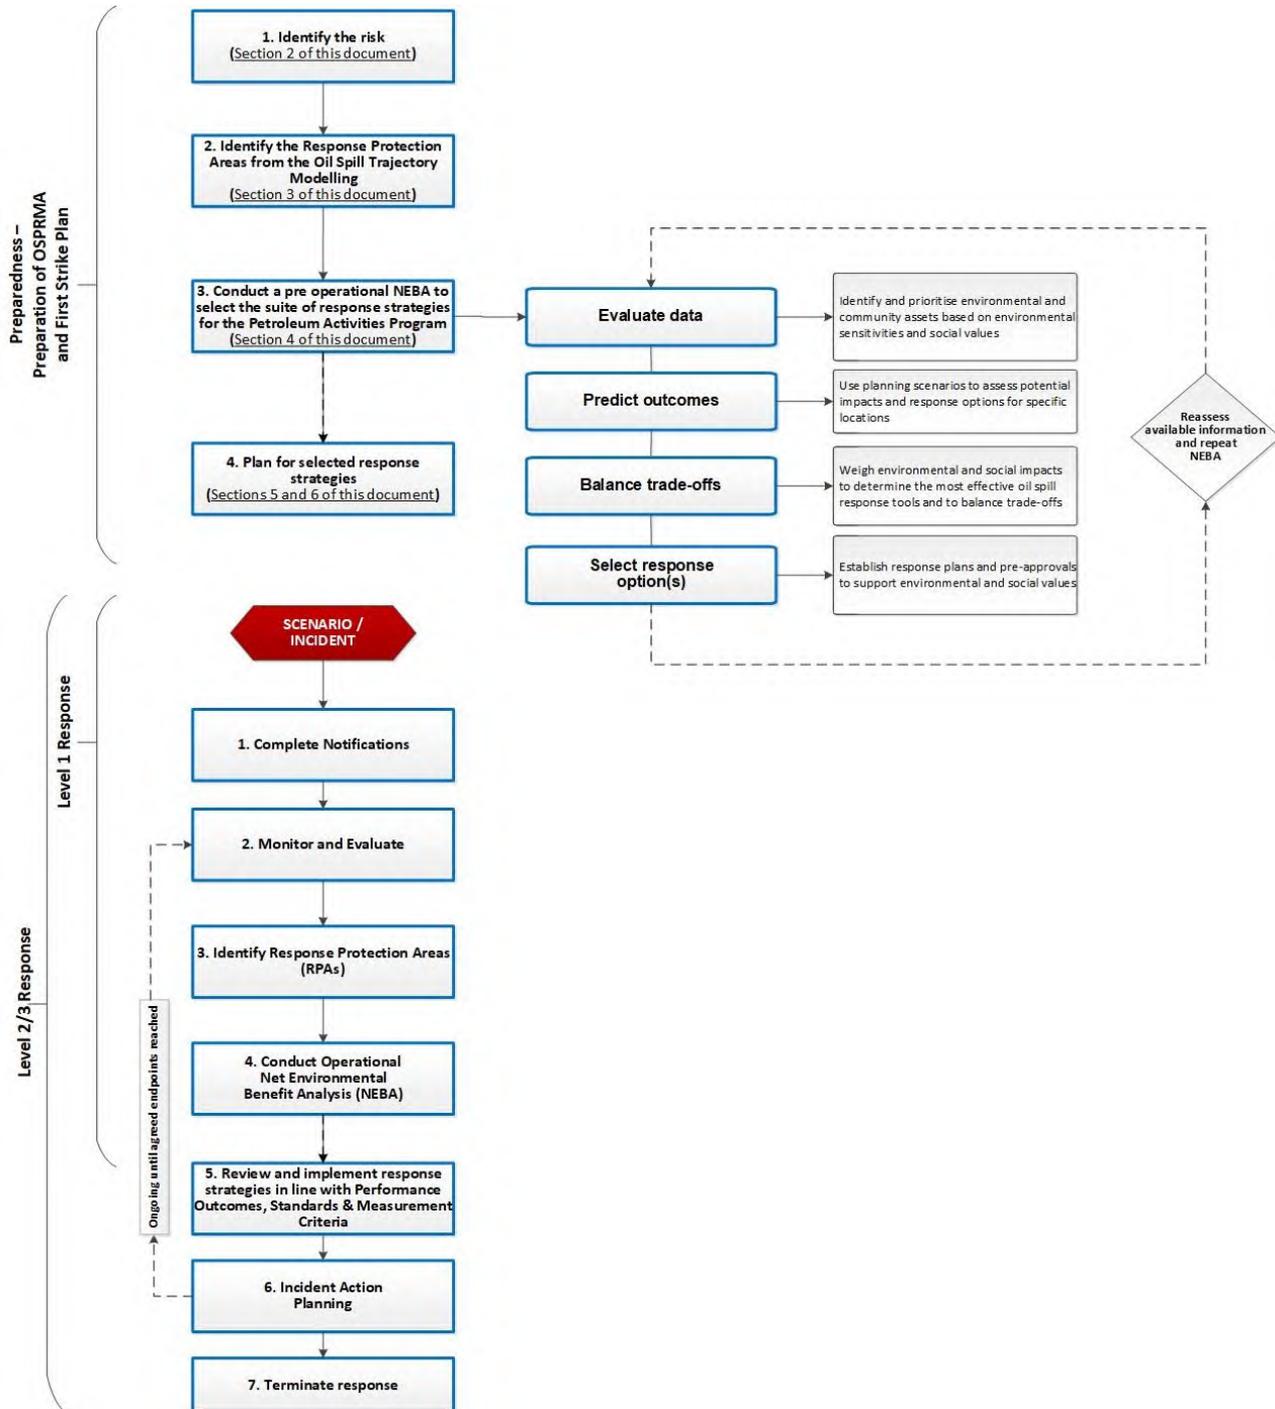

Figure 4-1: Net Environmental Benefit Analysis (NEBA) flowchart

4.1 Pre-operational / Strategic NEBA

The pre-operational NEBA identifies positive and negative impacts to sensitive receptors from implementing the response techniques. Feasibility is considered by assessing the receptors potentially impacted above response thresholds (**Section 2.3.3**) and the surface concentrations (**Section 2.3.4**) from the deterministic modelling.

Completing a pre-operational NEBA is a key response planning control that reduces the environmental risks and impacts of implementing the selected response techniques. The pre-operational NEBA for this PAP is in **ANNEX A: Net Environmental Benefit Analysis** detailed outcomes.

4.2 Stage 1: Evaluate data

Woodside identifies and prioritises environmental and community assets based on environmental sensitivities and social values, informed through the use of trajectory modelling. Interpretation of stochastic oil spill modelling determines the EMBA for the release, which defines the spatial area that may be potentially impacted by the PAP activities.

4.2.1 Define the scenario(s)

Woodside uses scenarios identified from the risk assessment in the EP to assess potential impacts and response options for specific locations. The WCCS is then selected for deterministic modelling and is used for this pre-operational NEBA. Outlier locations with potential environmental impacts, selected from the stochastic modelling may also be included for assessment. Response thresholds and deterministic modelling are then used to assess the feasibility/effectiveness and scale of the response.

Table 4-1: Scenario summary information (WCCS, CS-01, CS-02 and CS-03)

Scenario summary information	
Scenario	Surface release of vessel fuel tank due to a vessel collision
Locations	CS-01: 20° 21' 3.28" S, 116° 42' 5.58" E (outside Mermaid Sound)
	CS-02: 20° 03' 1.44" S, 115° 31' 35.04" E (within Montebello MP)
	CS-03: 19° 53' 54.72" S, 113° 14' 19.56" E (in Scarborough Field, FPU location)
Oil Type	Marine Diesel
Fate and Weathering	Refer to Section 2.2.1
Volume and duration of release	2000 m ³ instantaneous

4.2.1.1 Hydrocarbon characteristics

Marine Diesel

Marine Diesel is typically classed as an International Tanker Owners Pollution Federation (ITOPF) Group I/II oil.

Marine diesel is a mixture of volatile and persistent hydrocarbons with low proportions of highly volatile and residual components. Under constant 5 kn wind conditions, about 6% of the oil mass is predicted to evaporate within the first 12 hours (BP < 180 °C); a further 35% should evaporate within the first 24 hours (180 °C < BP < 265 °C); and a further 54% should evaporate over several days (265 °C < BP < 380 °C). Approximately 5% of the oil is shown to be persistent. The aromatic content of the oil is approximately 3%. Under variable wind conditions where winds are of a greater strength,

more entrainment of oil into the water column is predicted (about 45% after 24 hours). A further 35% is forecast to evaporate, leaving only a small proportion of the oil floating on the water surface (<1%).

The heavier (low volatility) components of the oil have a tendency to entrain into the upper water column due to wind-generated waves but can subsequently resurface if wind-waves abate. Therefore, the heavier components of this oil can remain entrained or on the sea surface for an extended period, with associated potential for dissolution of the soluble aromatic fraction.

Table 4-2: Oil fate, behaviour and impacts

Deterministic modelling results (CS-01 – outside Mermaid Sound)	
Minimum time to shoreline contact (above 100 g/m ²)	53 hours (2.2 days) at the Dampier Archipelago
Largest volume ashore at any single RPA (above 100 g/m ²)	3 m ³ at the Dampier Archipelago
Largest total shoreline accumulation (above 100 g/m ²)	156 g/m ² at the Dampier Archipelago
Stochastic modelling results (CS-02 – within Montebello MP)	
Minimum time to shoreline contact (above 100 g/m ²)	No contact at threshold
Largest volume ashore at any single RPA (above 100 g/m ²)	No contact at threshold
Largest total shoreline accumulation (above 100 g/m ²)	No contact at threshold
Stochastic modelling results (CS-03 – Scarborough field, FPU location)	
Minimum time to shoreline contact (above 100 g/m ²)	No contact at threshold
Largest volume ashore at any single RPA (above 100 g/m ²)	No contact at threshold
Largest total shoreline accumulation (above 100 g/m ²)	No contact at threshold

4.2.2 Determining potential response options

The available response techniques based on current technology can be summarised under the following headings:

- Monitor and evaluate (including operational monitoring)
- Source control (via vessel SOPEP)
- Containment and recovery
- In situ burning
- Surface dispersant application:
 - aerial dispersant application
 - vessel dispersant application
- Shoreline protection and deflection
- Shoreline clean-up:
 - Phase 1 – Mechanical clean-up
 - Phase 2 – Manual clean-up

- Phase 3 – Final polishing
 - Oiled wildlife response (including hazing)
 - Waste management
 - Post spill monitoring/scientific monitoring

An assessment of which response options are feasible for the scenarios is included below in **Table 4-3**. These options were evaluated against each scenario's parameters including oil type, volume and characteristics, prevailing weather conditions, logistical support, and resource availability to determine their deployment feasibility.

A shortlist of the feasible response options is then carried forward for the ALARP assessment with a justification for the exclusion of other response techniques included in **Section 4.2.3**. This assessment will typically result in a range of available options, that are deployed at different areas (at-source, offshore, nearshore and onshore) and times through the response. The NEBA process assists in prioritising which options to use where and when and timings throughout the response.

Table 4-3: Response technique evaluation – Surface Release

Response Technique	Effectiveness	Feasibility	Decision	Rationale for the decision
Hydrocarbon: Marine Diesel				
Monitor and Evaluate	<p>Will be effective in tracking the location of the spill, predicting potential impacts and triggering further monitoring and response techniques as required. Operational monitoring (OM) techniques include:</p> <ul style="list-style-type: none"> OM01 Predictive modelling of hydrocarbons – used throughout release. 'Ground-truthed' using the outputs of all other monitoring techniques. OM02 Surveillance and reconnaissance to detect hydrocarbons and resources at risk – from outset of release. OM03 Monitoring of hydrocarbon presence, properties, behaviour and weathering in water – from outset of release. OM04 Pre-emptive assessment of sensitive receptors at risk – triggered once OM01, OM02 and OM03 inform likely RPAs at risk. OM05 Shoreline assessment – once OM02, OM03 and OM04 inform which RPAs have been impacted. 	<p>Monitoring of a diesel release is a feasible response technique and outputs can be used to guide decision making on the use of other response techniques and providing information to regulatory agencies including AMSA and Western Australia's Department of Transport (WA DoT).</p>	Yes	<p>Monitoring the release will be necessary to:</p> <ul style="list-style-type: none"> Validate trajectory and weathering models Determine the behaviour of the oil in water Determine the location and weathering condition of the slick Provide forecasts of spill trajectory Determine appropriate response techniques Determine effectiveness of response techniques Confirm impact pathways to receptors
Source Control (via vessel SOPEP)	<p>Controlling the spill of diesel at source would be the most effective way to limit the quantity of hydrocarbon entering the marine environment.</p>	<p>A spill of diesel from a vessel collision will be instantaneous and source control will be limited to what the vessel or facility can achieve whilst responding to the incident.</p>	Yes	<p>Ability to stop the spill at source will be dependent upon the specific spill circumstances and whether or not it is safe for response personnel to access/isolate the source of the spill.</p>
Surface Dispersant Application	<p>Dispersants are not considered effective when applied on thin surface films such as diesel. The dispersant droplets tend to pass through the surface films without binding to the hydrocarbon.</p>	<p>Marine diesel has a high portion of non-persistent (light-ends) component and is prone to rapid spreading and evaporation thus the use of dispersant would be deemed an unnecessary response technique.</p> <p>Furthermore, the volatile nature of Marine Diesel is also likely to lead to unsafe conditions in the vicinity of fresh hydrocarbon thus this response technique is deemed inappropriate.</p>	No	<p>The application of dispersant to marine diesel is unnecessary as the diesel will rapidly evaporate and would thus unnecessarily introduce additional chemical substances to the marine environment. The additional entrainment would also increase exposure of subsea species and habitats to hydrocarbons.</p>
Containment and Recovery	<p>Containment and recovery have an effective recovery rate of 5-10% when a hydrocarbon encounter rate of 25-50% is achieved at BAOAC 4 and 5. Containment and recovery requires a spill to be BAOAC 4 or 5 with a 50-100% coverage at a thickness of 100 g/m² (or 0.1 mm) to 200 g/m².</p>	<p>The rate at which diesel would spread in the warm waters off the North West Shelf mean that this strategy would not be feasible.</p> <p>Furthermore, the volatile nature of Marine Diesel is also likely to lead to unsafe conditions in the vicinity of fresh hydrocarbon thus this response technique is deemed inappropriate.</p>	No	<p>Containment and recovery would be an inappropriate response technique as the coverage requirements would not be achieved by a marine diesel spill.</p> <p>In addition, most of the spilled diesel would have been subject to rapid evaporation and entrainment prior to the commencement of containment and recovery operations.</p>
In situ Burning	<p>In situ burning is only effective where minimum slick thickness can be achieved.</p>	<p>Use of in situ burning as a response technique for marine diesel is unfeasible as the minimum slick thickness cannot be attained due to rapid spreading. In addition, there is a limited window of opportunity in which this technique can be applied (prior to evaporation of the volatiles) which is unlikely to be achieved. Furthermore, entering a volatile environment to undertake this technique would be unsafe for response personnel.</p>	No	<p>Diesel characteristics are not appropriate for the use of in situ burning as the minimum thickness will not be attained due to rapid spreading. Furthermore, it would unnecessarily cause an increase in the release of atmospheric pollutants.</p>

Response Technique	Effectiveness	Feasibility	Decision	Rationale for the decision
Hydrocarbon: Marine Diesel				
Mechanical Dispersion	Mechanical dispersion involves the use of a vessel's prop wash and/or fire hose to target surface hydrocarbons to achieve dispersion into the water column. However, this technique is of limited benefit in an open ocean environment where wind and wave action are likely to deliver similar advantages.	<p>Although the technique is feasible, highly volatile hydrocarbons are likely to weather, spread and evaporate quickly.</p> <p>The volatile nature of the oil is also likely to lead to unsafe conditions in the vicinity of fresh hydrocarbon.</p> <p>Additionally, any vessel used for mechanical dispersion activities would be contaminated by the hydrocarbon and could potentially cause secondary contamination of unimpacted areas when exiting the spill area.</p> <p>The decontamination of a vessel used for mechanical dispersion activities would result in additional quantities of oily waste requiring appropriate handling and treatment.</p>	No	Given the limited benefit of mechanical dispersion over natural wind and wave action, secondary contamination and waste issues, and the associated safety risk of implementing the response for this activity, this strategy is deemed unsuitable.
Shoreline Protection and Deflection	This strategy is deployed at highly sensitive sites to prevent ingress of hydrocarbon or to increase concentrations in an area more suitable for shoreline clean-up.	Given the minimum time to shoreline contact is 2.2 days, use of shoreline protection and deflection for a spill of marine diesel may provide some environmental benefit and could prevent shoreline accumulation occurring (although maximum concentration of shoreline loading is predicted to be 3 m ³). Operational monitoring will be deployed from the outset of a spill to track the spill location and fate in real-time. Due to potentially high levels of volatiles from a spill of marine diesel, shoreline protection and deflection would only be undertaken if safe for response personnel.	Yes	<p>Protection and deflection may be deployed to prevent contamination of sensitive resources.</p> <p>RPA's predicted to be contacted are based on modelling outputs and thus may differ under the prevailing conditions of a real event, as the locations of oiling and the volume ashore may vary.</p>
Shoreline Clean up	Shoreline clean-up is an effective means of hydrocarbon removal from contaminated shorelines where coverage is at an optimum level of 250 g/m ² .	Potential for accumulation of oil on shorelines is predicted to be low. This strategy can reduce or prevent impact on sensitive receptors and helps prevent remobilisation of hydrocarbons. Although the concentrations are lower than optimal some shoreline clean-up may be possible at natural collection points on the coastline.	Yes	<p>Shoreline clean-up may be undertaken if sensitive receptors are impacted at levels that would permit an effective response and only if volatile levels are safe for responders.</p> <p>Low concentrations for manual clean up however there may be isolated higher concentrations in sheltered areas that could be manually recovered</p>
Oiled Wildlife	<p>Oiled wildlife response is an effective response technique for reducing the overall impact of a release on wildlife. This is mostly achieved through hazing to prevent additional fauna from being contaminated and through rehabilitation of fauna already subject to contamination.</p> <p>Air-breathing fauna such as marine mammals are most at risk from surface exposures due to the high volatile components. Marine mammals that have direct physical contact with surface, entrained or dissolved aromatic hydrocarbons may suffer surface fouling, ingest hydrocarbons and inhale toxic vapours.</p>	Due to the likely volatile atmospheric conditions surrounding a diesel spill, response options would be limited to hazing to ensure the safety of response personnel. In addition, any rehabilitation could only be undertaken by trained specialists.	Yes	In the event wildlife are at risk of contamination, oiled wildlife response will be undertaken as and where required.

4.2.3 Exclusion of response techniques

Response techniques not feasible for the worst-case scenario for the PAP are detailed in the subsections below and are excluded from further assessment within this document.

4.2.3.1 Containment and recovery

Marine diesel is prone to rapid spreading and evaporation thus reducing the feasibility of containment and recovery as a response technique. Furthermore, entering a volatile environment to undertake this technique would be unsafe for response personnel. Although this scenario results in surface oil of BAOAC 4, this only occurs within the first few hours during which time volatile levels would be very high and unsafe for response personnel.

4.2.3.2 Surface dispersant application

Marine diesel is prone to rapid spreading and evaporation thus the use of dispersant would be deemed an unnecessary response technique. The application of dispersant to marine diesel is unnecessary as the diesel will rapidly evaporate and would thus unnecessarily introduce additional chemical substances to the marine environment. The additional entrainment would also increase exposure of subsea species and habitats to hydrocarbons.

4.2.3.3 Mechanical dispersion

Mechanical dispersion involves the use of a vessel's prop wash and/or fire hose to target surface hydrocarbons to achieve dispersion into the water column. However, this technique is of limited benefit in an open ocean environment where wind and wave action are likely to deliver similar advantages. The volatile nature of the oil is likely to lead to unsafe conditions in the vicinity of fresh hydrocarbon. There are also secondary contamination and waste issues to consider.

4.2.3.4 In situ burning

This technique requires calm sea state conditions as is required for containment and recovery operations, which limits its feasibility in the offshore waters of the Operational Area. Optimum weather conditions are <20 knot wind speed and waves <1 to 1.5 m with oil collected to a minimum 3mm thick layer. Due to the conditions in Operational Area it is expected that the ability to contain oil may be limited as the sea state may exceed the optimum conditions. It is preferable that oil is fresh and does not emulsify to maximise burn efficiency and reduce residue thickness.

There are health and safety risks for response personnel associated with the containment and subsequent burning of hydrocarbons. It is also suggested that the residue from attempts to burn would sink, thereby posing a risk to the environment. The longer-term effects of burn residues on the marine environment are not fully understood and therefore, no assessment of the potential environmental impact can be determined. Furthermore, it is unlikely that MDO would achieve the required thickness for in situ burning, rendering this an unsuitable method.

Until further operational and environmental information becomes available, Woodside will not consider this option.

4.3 Stage 2: Predict outcomes

Woodside uses planning scenarios to assess potential impacts and response options for specific locations. Locations with potential environmental impacts, selected from the stochastic modelling are included for assessment. Response thresholds and deterministic modelling are then used to assess the feasibility/effectiveness of a response.

4.4 Stage 3: Balance trade-offs

Woodside considers environmental impacts and response effectiveness/feasibility to determine the most effective oil spill response tools and balance trade-offs, using an automated NEBA tool. The

tool considers potential benefits and impacts associated with a response at sensitive receptors and then considers the effectiveness/feasibility of the response to select the response techniques carried forward to the ALARP assessment. The NEBA can be found in **ANNEX A: Net Environmental Benefit Analysis** detailed outcomes.

4.5 Stage 4: Select best response options

To select the response technique, all the other stages in the NEBA process are considered and used to establish response plans and any pre-approvals to support protection of identified environmental and social values.

The response techniques implemented may vary according to a particular spill. The hydrocarbon type released and the sensitivities of the receptors (both ecological and socio-economic) may influence the response. The pre-operational NEBA broadly evaluates each response technique and supports decisions on whether they are feasible and of net environmental benefit. Response techniques that are not feasible or beneficial are rejected at this stage and not progressed to planning.

Further risks and impacts from implementing the selected response options are outlined in **Section 7**.

Table 4-4: Selection and prioritisation of response techniques

Response planning scenario	Key characteristics for response planning	Feasibility of response techniques									Outline response technique
		Monitor and evaluate	Source control via vessel SOPEP	Surface dispersant application	Mechanical dispersion	In situ burning	Containment and recovery	Shoreline protection and deflection	Shoreline clean-up	Oiled wildlife response	
Release of up to 2000 m ³ marine diesel from a vessel collision (residual component of 100 m ³)	The shortest timeframe that shoreline contact from floating oil is predicted at >100 g/m is 2.2 days at Dampier Archipelago with shoreline accumulation peaking at approximately 3 m ³ . Other islands, banks, shoals and mainland locations may be exposed to entrained hydrocarbons.	Yes	Yes	No	No	No	No	Yes	Yes	Yes	<ul style="list-style-type: none"> Monitor and evaluate. Initiate vessel source control if safe and feasible. If operational monitoring activities indicate surface hydrocarbons in sufficient concentration are moving toward shorelines, the Protection and Deflection Operational Plan will be used. Shoreline clean-up may be undertaken if sensitive receptors are impacted at levels that would permit an effective response and only if volatile levels are safe for responders. Plan for oiled wildlife response and implement if oiled wildlife is observed.

From the NEBA undertaken on the WCCS identified the primary response techniques are;

- Monitor and evaluate
- Source control – vessel SOPEP
- Shoreline protection and deflection
- Shoreline clean-up
- Oiled wildlife response

Additional response strategies would be considered based on the inputs and field reports from the monitoring activities. This may include:

- Waste management
- Scientific monitoring programs

5 HYDROCARBON SPILL ALARP PROCESS

Woodside's hydrocarbon spill ALARP process is aligned with guidance provided by NOPSEMA in *ALARP Guidance Note N-04300-GN0166 (2022)* and *Guidance Note GN1488 (2021)* and is set out in the 'Woodside Hydrocarbon Spill Oil Spill Preparedness and Response Mitigation Assessment (OSPRMA) Development Guidelines'.

From the identified response planning need and pre-operational NEBA, Woodside conducts a structured, semi-quantitative hydrocarbon spill process which has the following steps:

1. Considers the Response Planning Need identified in terms of surface area (km²) and available surface hydrocarbon volumes (m³) against existing Woodside capability;
2. Considers alternative, additional, and improved options for each response technique/control measure by providing an initial and, if required, detailed evaluation of:
 - Predicted cost associated with adopting the control measure,
 - Predicted change/environmental benefit, and
 - Predicted effectiveness/feasibility of the control measure.
3. Evaluates the risks and impacts of implementing the proposed response techniques, and any further control measures with associated environmental performance to manage these additional risks and impacts.

Woodside considers the risks and impacts from a hydrocarbon spill to have been reduced to ALARP when:

1. A structured process for identifying and considering alternative, additional, and improved options has been completed for each selected response technique;
2. The analysis of alternate, additional, and improved control measures meets one of the following criteria:
 - All identified, reasonably practicable control measures have been adopted; or
 - No identified reasonably practicable additional, alternative and/or improved control measures would provide further overall increased proportionate environmental benefit; or
 - No reasonably practical additional, alternative, and/or improved control measures have been identified.
3. Where an alternative, additional and/or improved control measure is adopted, a measurable level of environmental performance has been assigned.
4. Higher order impacts/ risks have received more comprehensive alternative, additional, and improved control measure evaluations and do not just compare the cost of the adopted control measures to the costs of an extreme or clearly unreasonable control measure.
5. Cumulative effects have been analysed when considered in combination across the whole activity.

The response technique selection is based on the risk assessment conducted in the EP. The risk assessment identifies the type of oil, volume of release, duration of release, predicted fate, weathering and the EMBA (along with other requirements such as time to impact and predicted volumes ashore). Modelling is then used to inform the NEBA and the prioritisation of suitable response options. The scale of the response techniques selected in the pre-operational NEBA is informed through the assessment of results from deterministic modelling.

For the purpose of the ALARP assessment, the following terms and definitions have been used:

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

- Response techniques are considered the control measures that reduce consequences from hydrocarbon spill events. The terms 'response technique' and 'control measure' are used interchangeably.
- Cost is defined as the time, effort and/or trouble taken in financial, safety, design/storage/installation, capital/lease, and/or operations/maintenance terms to adopt a control measure.
- Where the predicted change to environmental impact is compared against standard environmental values and sensitivities impacts using positive or negative criteria from the NEBA Impact Ranking Classification Guidance in Annex A.

5.1 Monitor and evaluate (including operational monitoring)

Monitor and evaluate includes the gathering and evaluation of data to inform the oil spill response planning and operations. It includes fate and trajectory modelling, spill tracking, weather updates and field observations. This response option is deployed in some capacity for every event. The table below provides the operations monitoring plans that support the successful execution of this response technique.

Table 5-1 below provides the operations monitoring plans that support the successful execution of this response technique.

Table 5-1: Description of supporting operational monitoring plans

ID	Title
OM01	Predictive modelling of hydrocarbons to assess resources at risk
OM02	Surveillance and reconnaissance to detect hydrocarbons and resources at risk
OM03	Monitoring of hydrocarbon presence, properties, behaviour and weathering in water
OM04	Pre-emptive assessment of sensitive receptors at risk
OM05	Shoreline assessment

Woodside maintains an *Operational Monitoring Operational Plan*. If shoreline contact is predicted, Response Protection Areas (RPAs) will be identified and assessed before contact. If shorelines are contacted, a shoreline assessment survey will be completed to guide effective shoreline clean-up operations. This plan includes the process for the IMT to mobilise resources depending on the nature and scale of the spill.

The proximity of Exmouth to the spill event location means that multiple logistical options are available to monitor the spill in relatively short timeframes. The primary mobilisation base for initial monitoring activities would be Exmouth. However, in the event of an extended spill with potential to impact receptors further afield, monitoring activities may also be mobilised from Onslow, Dampier or Karratha.

5.1.1 Response need based on predicted consequence parameters

The following statements identify the key parameters upon which a response need can be based:

- The shortest timeframe for shoreline contact from floating oil is predicted to be 2.2 days at Dampier Archipelago.
- Entrained hydrocarbon concentrations greater than 100 ppb may occur at numerous locations, including islands, banks, shoals or mainland locations, between 1 hour and 34 days following the release.
- Arrangements for support organisations who provide specialist services or resources should be tested regularly.
- Plans, procedures and support documents need to be in place for Operational and Support functions. These should be reviewed and updated regularly.

5.1.2 Environmental performance based on need

Table 5-2: Environmental Performance - Monitor and Evaluate

Environmental Performance Outcome		To gather information from multiple sources to establish an accurate common operating picture as soon as possible and predict the fate and behaviour of the spill to validate planning assumptions and adjust response plans as appropriate to the scenario.		
Control measure		Performance Standard		Measurement Criteria (Section 5.9)
1	Oil spill trajectory modelling	1.1	Initial modelling available within 6 hours using the Rapid Assessment Tool	1, 3B, 3C, 4
		1.2	Detailed modelling available within 4 hours of RPS receiving information from Woodside	
		1.3	Detailed modelling service available for the duration of the incident upon contract activation	
2	Tracking buoy	2.1	Tracking buoy located on facility/vessel and ready for deployment 24/7	1, 3A, 3C, 4
		2.2	Deploy tracking buoy from facility within 2 hours as per the First Strike Plan.	1, 3A, 3B, 4
		2.3	Contract in place with service provider to allow data from tracking buoy to be received 24/7 and processed.	1, 3B, 3C, 4
		2.4	Data received to be uploaded into Woodside common operating picture (COP) daily to improve the accuracy of other monitor and evaluate techniques.	1, 3B, 4
3	Satellite imagery	3.1	Contract in place with 3 rd party provider to enable access and analysis of satellite imagery. Imagery source/type requested on activation of service.	1, 3C, 4
		3.2	3 rd party provider will confirm availability of an initial acquisition within 2 hours	1, 3B, 3C, 4
		3.3	First image received within 24 hours of Woodside confirming to 3 rd party provider its acceptance of the proposed acquisition plan.	1
		3.4	3 rd party provider to submit report to Woodside per image. Report is to include a polygon of any possible or identified slick(s) with metadata.	1
		3.5	Data received to be uploaded into Woodside COP daily to improve accuracy of other monitor and evaluate techniques.	1, 3B, 4
		3.6	Satellite Imagery services available and employed during response	1, 3C, 4
4	Aerial surveillance	4.1	2 trained aerial observers available to be deployed by day 1 from resource pool.	1, 2, 3B, 3C, 4
		4.2	1 aircraft available for two sorties per day, available for the duration of the response from day 1	1, 3C, 4
		4.3	Observer to compile report during flight as per first strike plan. Observers report available to the IMT within 2 hours of landing after each sortie.	1, 2, 3B, 4
		4.4	Unmanned Aerial Vehicles/Systems (UAV/UASs) to support SCAT and pre-emptive assessments as contingency if required.	1, 2
5	Hydrocarbon detections in water	5.1	Activate 3 rd party service provider as per first strike plan. Deploy resources within 2.5 days: <ul style="list-style-type: none"> • 3 specialists in water quality monitoring • 2 monitoring systems and ancillaries • 1 vessel for deploying the monitoring systems with a dedicated winch, A-frame or Hiab and ancillaries to deploy the equipment. 	1, 2, 3C, 3D, 4
		5.2	Water monitoring services available and employed during response	1, 3C, 4
		5.3	Preliminary results of water sample as per contractor's implementation plan within 7 days of receipt of samples at the accredited lab	
		5.4	Daily fluorometry reports as per service provider's implementation plan will be provided to IMT to validate modelling and monitor presence/absence of entrained hydrocarbons.	
		5.5	Use of Autonomous Underwater Vehicles (AUVs) for hydrocarbon presence and detection may be used as a contingency if the operational NEBA confirms conventional methods are unsafe or not possible.	1, 2, 3C, 4
6	Pre-emptive assessment	6.1	Within 2 days, deployment of 2 specialists from resource pool in establishing the status of sensitive receptors.	1, 2, 3B, 3C, 4

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

Environmental Performance Outcome		To gather information from multiple sources to establish an accurate common operating picture as soon as possible and predict the fate and behaviour of the spill to validate planning assumptions and adjust response plans as appropriate to the scenario.		
Control measure		Performance Standard		Measurement Criteria (Section 5.9)
	of sensitive receptors	6.2	Daily reports provided to IMT on the status of the receptors to prioritise Response Protection Areas (RPAs) and maximise effective utilisation of resources.	1, 3B, 4
7	Shoreline assessment	7.1	Within 2 days, deployment of 2 specialists in SCAT from resource pool for each of the Response Protection Areas (RPAs) with predicted impacts at greater than 100 g/m ² .	1, 2, 3B, 3C, 4
		7.2	SCAT reports provided to IMT daily detailing the assessed areas to maximise effective utilisation of resources.	1, 3B, 4
		7.3	Shoreline access routes with the least environmental impact identified will be selected by a specialist in SCAT operations.	1
8	Management of environmental impact of the response risks	8.1	If vessels are required for access, anchoring locations will be selected to minimise disturbance to benthic habitats. Where existing fixed anchoring points are not available, locations will be selected to minimise impact to nearshore benthic environments with a preference for areas of sandy seabed where they can be identified.	1

The control measures and capability of Woodside and its third-party service providers are shown to support Monitor and Evaluate activities up to and including the identified WCCS. This is demonstrated by the following:

- Woodside has a documented, structured and tested capability for Monitor and Evaluate operations including internal trajectory modelling capabilities, tracking buoys located offshore and contracted aerial observation platforms with access to trained observers.
- Woodside and its third-party service providers ensure there is sufficient capability for the duration of the response.
- Woodside has assessed the existing capability available and considered potential alternative, additional and improved control measures. Where control measures have been selected and implemented, they are included in **Section 6**.
- The health and safety, financial, capital and operations/maintenance costs of implementing the alternative, additional or improved control measures identified and not carried forward are considered grossly disproportionate to the environmental benefit gained and/or not reasonably practicable for this PAP.
- The Monitor and Evaluate capability outlined in this section is part of the response developed to manage potential risks and impacts associated with the scenarios to ALARP, and there are no further additional, alternative and improved control measures other than those implemented that would provide further benefit.

5.2 Source Control via Vessel SOPEP

Vessel source control will be conducted, where feasible and in accordance with International Convention for the Prevention of Pollution from Ships (MARPOL) 73/78 Annex I, by the Vessel Master under the Shipboard Oil Pollution Emergency Plan (SOPEP) triggered by any loss of containment from the PAP vessels.

The SOPEP provides guidance to the Master and Officers on board the vessel with respect to the extra steps to be taken when an unexpected pollution incident has occurred or is likely to occur. The SOPEP contains all information and operational instructions required by International Marine Organisation (IMO) Resolution MEPC.54 (32) adopted on 6 March 1992, as amended by resolution MEPC.86 (44) adopted on 13 March 2000.

Its purpose is to set in motion the necessary actions to stop or minimise oil discharge and mitigate its effects and outlines responsibilities, pollution reporting requirements, procedures and resources needed in the event of a hydrocarbon spill from vessel activities.

In the event of a potential vessel collision, the vessel master may engage precautionary marine manoeuvres to avoid collision or commence pumping operations to transfer marine diesel and thus minimise the release.

5.2.1 Environmental performance based on need

Woodside has established control measures, environmental performance outcomes, performance standards and measurement criteria to be used for vessel-source oil spill response during the PAP which are detailed in Section 6.7 of the EP. The vessel master's roles and responsibilities are described in EP Section 7.3.

Performance standards for each contracted PAP vessel are detailed in the vessel's specific SOPEP. These standards ensure sufficient resources are available and are adequately tested to ensure implementation of the SOPEP in the event of a hydrocarbon spill.

5.3 Shoreline protection and deflection

The placement of containment, protection or deflection booms on and near a shoreline is a response technique to reduce the potential volume of hydrocarbons contacting or spreading along shorelines, which may reduce the scale of shoreline clean-up. Hydrocarbons contained by the booms would be collected where practicable.

Shorelines would be protected where accessible via vessel or shore. Where hydrocarbon contact has already occurred, there may still be value in deploying protection equipment to limit further accumulations and preventing remobilisation of stranded hydrocarbons.

Shoreline protection and deflection equipment would be mobilised to selected locations, where the following conditions were met:

- Sea-states and hydrocarbon characteristics are safe to deploy protection and deflection measures,
- Oil trajectory has been identified as heading towards identified RPAs.

5.3.1 Response need based on predicted consequence parameters

The following statements identify the key parameters upon which the response need can be based.

- Floating oil at the 10 g/m² threshold is predicted to arrive at the Dampier Archipelago with a probability of 2% after 27 hours (CS-01).
- Shoreline accumulation greater than the 100 g/m² threshold is predicted to occur at Dampier Archipelago after a minimum of 2.2 days with a maximum shoreline accumulation of 156 g/m² (CS-01).
- Pre-emptive assessment and shoreline assessments (OM04 and OM05) will be mobilised prior to shoreline accumulation at 100 g/m².
- Following pre-emptive assessments of sensitive receptors at risk, and in agreement of prioritisation with WA DoT (if a Level 2/3 incident and within State Waters), protection and deflection operations would commence until agreed termination criteria are reached.
- Shoreline response operations may extend 1-2 weeks following the release based on the predicted time for shoreline contact and the time to complete shoreline clean-up operations.
- Arrangements for support organisations who provide specialist services (trained personnel, protection and deflection equipment) and/or resources and should be tested regularly.
- Tactical Response Plans (TRPs) for Response Protection Areas (RPAs) along with other relevant plans, procedures and support documents need to be in place for Operational and Support functions. These should be reviewed and updated regularly.

In addition, a number of assumptions are required to estimate the response need for Shoreline Protection and Deflection. These assumptions have been described in the table below.

Table 5-3: Response Planning Assumptions – Shoreline Protection and Deflection

Response Planning Assumptions	
Safety considerations	Shoreline protection and deflection operations cannot be implemented if the safety of response personnel cannot be guaranteed. This requires an initial and ongoing risk assessment of health and safety hazards and risks at the site. Personnel safety issues may include: <ul style="list-style-type: none"> • hydrocarbon gas and/or liquid exposure • safe for deployment and conditions within range of vessels • high ambient temperatures.

Shoreline Protection and Deflection	One (1) Shoreline Protection and Deflection operation may include; <ul style="list-style-type: none">• Quantity of shoreline sealing boom (as outlined in TRP)• Quantity of fence or curtain boom (as outlined in TRP)• 1-2 x trained supervisors• 8-10 x personnel / labour hire Specific details of each operation would be tailored to the Tactical Response Plan implemented (where available).
--	--

5.3.2 Environmental performance based on need

Table 5-4: Environmental Performance – Shoreline Protection and Deflection

Environmental Performance Outcome		To stop hydrocarbons encountering particularly sensitive areas		
Control measure		Performance Standard		Measurement Criteria (Section 5.9)
9	Response teams	9.1	Relevant Tactical Response Plans (TRPs) will be identified in the first strike plan for activation within 12 hours of the release.	1, 3A, 3C, 4
		9.2	In liaison with WA DoT (for Level 2/3 incidents), mobilise teams to RPAs within 12 hours of operational monitoring predicting impacts. Teams to contaminated RPAs comprised of: <ul style="list-style-type: none"> • 1-2 trained specialists per operation • 8-10 personnel/labour hire Personnel sourced through resource pool	1, 2, 3B, 3C, 4
		9.3	One operation mobilised within 24 hours to each identified RPA. Expected to be one RPAs within two days (operation as detailed above)	1, 3A, 3B, 4
		9.4	12 trained personnel available within 48 hours sourced through resource pool.	1, 2, 3A, 3B, 3C, 4
		9.5	Open communication line to be maintained between IMT and infield operations to ensure awareness of progress against plan(s)	1, 3A, 3B
		9.6	The safety of shoreline response operations will be considered and appropriately managed. During shoreline operations: <ul style="list-style-type: none"> • All personnel in a response will receive an operational/safety briefing before commencing operations • Gas monitoring and site entry protocols will be used to assess safety of an operational area before allowing access to response personnel 	1, 3B, 4
10	Response equipment	10.1	Equipment mobilised from closest stockpile within 12 hours.	1, 3A, 3C, 4
		10.2	Supplementary equipment mobilised from State, AMOSC, AMSA stockpiles within 24 hours.	1, 3C, 3D, 4
		10.3	Supplementary equipment mobilised from OSRL within 48 hours.	
		10.4	Woodside maintains integrated fleet of vessels. Additional vessels can be sourced through existing contracts/frame agreements	1, 3A, 3C, 4
11	Management of Environmental Impact of the response risks	11.1	If vessels are required for access, anchoring locations will be selected to minimise disturbance to benthic primary producer habitats. Where existing fixed anchoring points are not available, locations will be selected to minimise impact to nearshore benthic environments with a preference for areas of sandy seabed where they can be identified	1
		11.2	Shallow draft vessels will be used to access remote shorelines to minimise the impacts associated with seabed disturbance on approach to the shorelines	

The resulting shoreline protection and deflection capability has been assessed against the WCCS. The range of techniques provide an ongoing approach to shoreline protection and deflection at identified RPAs.

Under optimal conditions, during the subsea and surface releases the capability available exceeds the need identified. It indicates that, the shoreline protection and deflection capability have the following expected performance:

- Deterministic modelling scenarios indicate that first shoreline impact at Dampier Archipelago may occur within 2.2 days for CS-01.
- Existing capability allows for mobilization and deployment of 1 protection and deflection operation (approximately 10-12 responders) within 24 hours (if required). The existing capability is considered sufficient to mobilise and deploy protection at RPAs prior to hydrocarbon contact, guided by the ongoing operational monitoring.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

- The most significant constraint on expanding the scale of response operations is the availability of accommodation and transport services in the region between Exmouth and Port Hedland, and the management of response generated waste. From previous assessment of accommodation in this region, Woodside estimates that current accommodation can cater for a range of 500-700 personnel per day for an ongoing operation.
- TRPs have been developed for all identified RPAs excepting international locations.
- Woodside has assessed the existing capability available and considered potential alternative, additional and improved control measures (**Section 6.3**).
- No further control measures that may result in an increased environmental benefit that involve moderate to significant cost and/or dedication of resources have been adopted as the timeframe required for deployment of this technique does not justify the excessive costs of identified alternate, improved or additional controls.

5.4 Shoreline clean-up

Shoreline clean-up may be undertaken using a broad range of techniques when floating hydrocarbons contact shorelines. The timing, location and extent of shoreline clean-up activities can vary from one scenario to another, depending on the hydrocarbon type, sensitivities and values contacted, shoreline type and access, degree of oiling, and area oiled.

Shoreline clean-up is typically undertaken as a three-phase process, phase one (gross contamination removal) involving the collection of bulk oil, either floating against the shoreline or stranded on it, phase two (moderate to heavy contamination removal) involving removal or in situ treatment of shoreline substrates such as sand or pebble beaches, and phase three (final treatment or polishing) involving removal of the remaining residues of oil. As phase one typically involves recovery of floating and pooled oil, and phase three removes minor volumes, they have not been considered in the assessment of response need for the scenarios identified.

The *Shoreline Clean-up Operational Plan* details the mobilisation and resource requirements for a shoreline clean-up operation including the logistics, support and facility arrangements to manage the movement of personnel and resources. The *Shoreline Cleanup Operational Plan* includes the process for the IMT to mobilise resources depending on the nature and scale of the spill. Woodside would activate and mobilise trained and competent personnel in shoreline assessment before or following shoreline contact at response thresholds.

Shoreline clean-up consists of different manual recovery techniques to remove hydrocarbons and contaminated debris from a shoreline; this is to minimise ongoing environmental contamination and impact. The National Plan also provides guidance on shoreline clean-up techniques as outlined in National Plan Guidance *Response, assessment and termination of cleaning for oil contaminated foreshores* (AMSA 2015).

5.4.1 Response need based on predicted consequence parameters

A number of assumptions are required to estimate the response need for shoreline clean-up. These assumptions have been described in the table below.

Table 5-5: Response Planning Assumptions – Shoreline Clean-up

Response planning assumptions: Shoreline clean-up	
Manual shoreline clean-up operation (Phase 2)	One, manual shoreline clean-up operation (Phase 2) may include: <ul style="list-style-type: none"> • 1–2 x trained supervisor • 8–10 x personnel/labour hire • Supporting equipment for manual clean-up including rakes, shovels, plastic bags etc.
Physical properties	Surface Threshold <ul style="list-style-type: none"> • Lower – 100 g/m² - 100% coverage of 'stain' – cannot be scratched off easily on coarse sediments or bedrock <ul style="list-style-type: none"> - Expected trigger to undertake detailed shoreline survey • Optimum – 250 g/m² – 25% coverage of 'coat' – can be scratched off with a fingernail on coarse sediments <ul style="list-style-type: none"> - Expected trigger to commence clean-up operations
Efficiency (m³ oil recovered per person per day)	Manual shoreline clean-up (Phase 2) - approx. 0.25–1 m ³ oil recovered per person per 10 hr day is based on moderate to high coverage of oil (100 g/m ² –1000 g/m ²) with manual removal using shovels/rakes, etc. from studies of previous response operations and exercises
Field operation supervisors required (per team)	Manual shoreline clean-up (Phase 2) – 1-2 trained supervisor(s) per operation (assumes one team per operation)
Personnel/ labour hire (per team)	Manual shoreline clean-up (Phase 2) – 8-10 personnel/labour hire per operation (assumes one team per operation)

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

- The shortest timeframe that shoreline contact from floating oil is predicted is 2.2 days at Dampier Archipelago with shoreline accumulation peaking at approximately 3 m³.
- Pre-emptive assessment and shoreline assessments (OM04 and OM05) will be mobilised prior to shoreline contact.
- Following Shoreline Assessment and agreement of prioritisation with WA Department of Transport, clean-up operations would commence until agreed termination criteria are reached.
- Arrangements for support organisations who provide specialist services (trained personnel, labour hire, shoreline clean-up, and site management equipment) and/or resources and should be tested regularly.
- Tactical Response Plans ([TRPs](#)) for Response Protection Areas (RPAs) along with other relevant plans, procedures and support documents should be in developed and in place for Operational and Support functions. These should be reviewed and updated regularly.

In addition, a number of assumptions are required to estimate the response need for shoreline clean-up. These assumptions have been described in the table below.

Table 5-6: Shoreline Clean-up techniques and recommendations

Technique	Description	Shoreline type		Application
		Recommended	Not recommended	
Natural recovery	Allowing shoreline to self-clean; no intervention undertaken.	<p>Remote and inaccessible shorelines for personnel, vehicles and machinery.</p> <p>Other clean-up techniques may cause more damage than allowing the shoreline to naturally recover.</p> <p>Natural recovery may be recommended for areas with mangroves and coral reefs due to their sensitivity to disturbance from other shoreline clean-up techniques.</p> <p>High-energy shorelines: where natural removal rates are high, and hydrocarbons will be removed over a short timeframe.</p>	<p>Low-energy shorelines: these areas tend to be where hydrocarbon accumulates and penetrates soil and substrates.</p>	<p>May be employed, if the operational NEBA identifies that other clean-up techniques will have a negligible or negative environmental impact on the shoreline.</p> <p>May also be used for buried or reworked hydrocarbons where other techniques may not recover these.</p>
Manual recovery	<p>Use of manpower to collect hydrocarbons from the shoreline.</p> <p>Use of this form of clean-up is based on type of shoreline.</p>	<p>Remote and inaccessible shorelines for vehicles and machinery.</p> <p>Areas where shorelines may not be accessible by vehicles or machinery and personnel can recover hydrocarbons manually.</p> <p>Where hydrocarbons have formed semi-solid to solid masses that can be picked up manually.</p> <p>Areas where nesting and breeding fauna cannot or should not be disturbed.</p>	<p>Coral reef or other sensitive intertidal habitats, as the presence of a response may cause more environmental damage than allowing them to recover naturally.</p> <p>For some high-energy shorelines such as cliffs and sea walls, manual recovery may not be recommended as it may pose a safety threat to responders.</p>	<p>May be used for sandy shorelines. Buried hydrocarbons may be recovered using shovels into small carry waste bags, but where possible the shoreline should be left to naturally recover to prevent any further burying of hydrocarbons (from general clean-up activities).</p>

No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

Technique	Description	Shoreline type		Application
		Recommended	Not recommended	
Sorbents	Sorbent boom or pads used to recover fluid or sticky hydrocarbons. Can also be used after manual clean-up to remove any residues from crevices or from vegetation.	<p>When hydrocarbons are free-floating close to shore or stranded onshore.</p> <p>As a secondary treatment method after hydrocarbon removal and in sensitive areas where access is restricted.</p>	<p>Access for deploying and retrieving sorbents should not be through soft or sensitive habitats or affect wildlife.</p>	<p>Used for rocky shorelines.</p> <p>Sorbent boom will allow for deployment from small shallow draught vessels, which will allow deployment close to shore where water is sheltered and to aid recovery.</p> <p>Sorbents will create more solid waste compared with manual clean-up, so will be limited to clean rocky shorelines.</p>
Vacuum recovery, flushing, washing	The use of high volumes of low-pressure water, pumping and/or vacuuming to remove floating hydrocarbons accumulated at shorelines.	<p>Suited to rocky or pebble shores where flushing can remobilise hydrocarbons (to be broken up) and aid natural recovery.</p> <p>Any accessible shoreline type from land or water. May be mounted on barges for water-based operations, on trucks driven to the recovery area, or hand-carried to remote sites.</p> <p>Flushing and vacuum may be useful for rocky substrate.</p> <p>Medium- to high-energy shorelines where natural removal rates are moderate to high.</p> <p>Where flushed hydrocarbons can be recovered to prevent further oiling of shorelines.</p>	<p>Areas of pooled light, fresh hydrocarbons may not be recoverable via vacuum due to fire and explosion risks.</p> <p>Shorelines with limited access.</p> <p>Flushing and washing not recommended for loose sediments.</p> <p>High-energy shorelines where access is restricted.</p>	<p>High volume low pressure (HVLP) flushing and washing into a sorbent boom could be used for rocky substrate, if protection booming has been unsuccessful in deflecting hydrocarbons from these areas.</p>

Technique	Description	Shoreline type		Application
		Recommended	Not recommended	
Sediment reworking	Movement of sediment to surf to allow hydrocarbons to be removed from the sediment and move sand via heavy machinery.	When hydrocarbons have penetrated below the surface. Recommended for pebble/cobble shoreline types. Medium- to high-energy shorelines where natural removal rates are moderate to high.	Low-energy shorelines as the movement of substrate will not accelerate the natural cleaning process. Areas used by fauna which could potentially be affected by remobilised hydrocarbons.	Use of wave action to clean sediment: appropriate for sandy beaches where light machinery is accessible.
Vegetation cutting	Cutting vegetation to prevent oiling and reduce volume of waste and debris.	Vegetation cutting may be recommended to reduce the potential for wildlife being oiled and reduce oiled waste before contact. Where oiling is restricted to fringing vegetation.	Access in bird-nesting areas should be restricted during nesting seasons. Areas of slow-growing vegetation.	May be used on shorelines where vegetation can be safely cleared to reduce oiling.
Cleaning agents (OSCA)	Application of chemicals such as dispersants to remove hydrocarbons.	May be used for manmade structures and where public safety may be a concern.	Natural substrates and in low-energy environments where sufficient mixing energy is not present.	Not recommended for shorelines. Could be used for manmade structures such as boat ramps.

5.4.2 Environmental performance based on need

Table 5-7: Environmental Performance – Shoreline Clean-up

Environmental Performance Outcome		To remove bulk and stranded hydrocarbons from shorelines and facilitate shoreline amenity habitat recovery.		
Control measure		Performance Standard		Measurement Criteria (Section 5.9)
12	Shoreline responders	12.1	In liaison with WA DoT (for Level 2/3 incidents), deployment of one shoreline clean-up team to each contaminated RPA comprised of: <ul style="list-style-type: none"> • 1-2 trained specialists per operation • 8-10 personnel/labour hire Personnel sourced through resource pool within 48 hours of request from the IMT.	1, 2, 3A, 3B, 3C, 4
		12.2	Relevant Tactical Response Plans (TRPs) will be identified in the first strike plan for activation within 12 hours of the release	1, 3A, 3C, 4
		12.3	Clean-up operations for shorelines in line with results and recommendations from SCAT outputs	1, 3A, 3B
		12.4	All shoreline clean-up sites will be zoned and marked before clean-up operations commence.	
		12.5	In liaison with WA DoT (for Level 2/3 incidents), mobilise and deploy one shoreline clean-up operation where operational monitoring predicts accumulations >100 g/m ² by Day 2.	1, 2, 3A, 3C, 4
		12.6	The safety of shoreline response operations will be considered and appropriately managed. During shoreline clean-up operations: <ul style="list-style-type: none"> • All personnel in a response will receive an operational/safety briefing before commencing operations • Gas monitoring and site entry protocols will be used to assess safety of an operational area before allowing access to response personnel 	1, 3B, 4
		12.7	Open communication line to be maintained between IMT and infield operations to ensure awareness of progress against plan(s)	1, 3A, 3B
13	Shoreline clean-up equipment	13.1	Contract in place with 3 rd party providers to access equipment.	1, 3A, 3C, 4
		13.2	Equipment mobilised from closest stockpile within 24 hours.	
		13.3	Supplementary equipment mobilised from State, AMOSC, AMSA stockpiles within 2 days, if required.	1, 3C, 3D, 4
		13.4	Supplementary equipment mobilised from OSRL within 5 days, if required.	
14	Management of Environmental Impact of the response risks	14.1	If vessels are required for access, anchoring locations will be selected to minimise disturbance to benthic primary producer habitats. Where existing fixed anchoring points are not available, locations will be selected to minimise impact to nearshore benthic environments with a preference for areas of sandy seabed where they can be identified	1
		14.2	Shallow draft vessels will be used to access remote shorelines to minimise the impacts associated with seabed disturbance on approach to the shorelines	
		14.3	Vehicular access will be restricted on dunes, turtle nesting beaches and in mangroves	
		14.4	Removal of vegetation will be limited to moderately or heavily oiled vegetation	
		14.5	Shoreline access routes with the least environmental impact identified will be selected by a specialist in SCAT operations	
		14.6	Oversight by trained personnel who are aware of the risks	
		14.7	Trained unit leader's brief personnel of the risks prior to operations	

The resulting shoreline clean-up capability has been assessed against the WCCS. The range of techniques provide an ongoing approach to shoreline clean-up at identified RPAs. Woodside's capability can cover all required shoreline clean-up operations for the PAP. Whilst modelling predicts shoreline contact from day 2 at Dampier Archipelago Woodside is satisfied that the current capability is managing risks and impacts to ALARP.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

The capability available meets the need identified for this activity. The shoreline clean-up capability has the following expected performance (if required during a response):

- Woodside has the capacity to mobilise and deploy up to 1-2 shoreline clean-up teams (approx. 10-20 responders) by Day 2 using existing labour hire contracts with Woodside, AMOSC, Core Group, AMSA, WA DoT and OSRL team leads.
- Pre-emptive assessment and shoreline assessments (OM04 and OM05) will be mobilised prior to shoreline contact to determine if shoreline clean-up is feasible and necessary.
- Assessment of response capability indicates that for a worst-case scenario the actual teams required would meet the available capability.
- Woodside has considered deployment of additional personnel to undertake shoreline clean-up operations but is satisfied that the identified level of resource is balanced between cost, time and effectiveness. The most significant constraint on expanding the scale of response operations is accommodation and transport of personnel in Exmouth and management of response generated waste. From previous assessment of accommodation in Exmouth, Woodside estimates that current accommodation can cater for a range of 500-700 personnel per day for an ongoing operation, which exceeds the number of personnel that would be required.
- TRPs have been developed for all identified RPAs.
- Woodside has assessed the existing capability available and considered potential alternative, additional and improved control measures (**Section 6.3**).
- No further control measures that may result in an increased environmental benefit that involve moderate to significant cost and/or dedication of resources have been adopted as the limited scale and timeframe for deployment of this technique does not justify the excessive costs of identified alternate, improved or additional controls.

5.5 Oiled wildlife response (including hazing)

Woodside would implement a response in accordance with the Western Australian *Oiled Wildlife Operational Plan* (WA OWRP). This plan includes the process for the IMT to mobilise resources depending on the nature and scale of the spill. Oiled wildlife operations would be implemented with advice and assistance from the Oiled Wildlife Advisor from the Western Australia Department of Biodiversity, Conservation and Attractions (DBCA).

Oiled wildlife response is undertaken in accordance with the (WA OWRP) to ensure it is conducted in accordance with legislative requirements under the Animal Welfare Act 2002.

If there is a net environmental benefit, oiled wildlife operations will be conducted 24 hours per day to reduce the time for rehabilitation and release of oiled wildlife. Hazing and pre-emptive capture techniques to keep non-oiled animals away from contaminated habitat in instances where it is deemed appropriate will be conducted in accordance with the (WA OWRP), specifically vessels used in hazing/pre-emptive capture will approach fauna at slow speeds to ensure animals are not directed towards the oil and deterrence/hazing and pre-emptive capture will only be conducted if Woodside has licensed authority from DBCA and approval from the Incident Controller.

Shoreline access will be considered as part of the operational NEBA. Vehicle access would be restricted on dunes, turtle nesting beaches and in mangroves. Woodside retains specialist personnel to support and manage oiled wildlife operations, including trained and competent responders in Exmouth or the wider region. Additional personnel would be sourced through Woodside's arrangements to support an oiled wildlife response as required.

5.5.1 Response need based on predicted consequence parameters

The following statements identify the key parameters upon which a response need can be based:

- Modelling predicts the shortest time to shoreline contact at day 2 at Dampier Archipelago.
- The offshore location of the release site is expected to initially result in low numbers of at-risk or impacted wildlife.
- As the surface oil approaches shorelines, potential for oiled wildlife impacts are likely to increase.
- It is estimated that an oiled wildlife response would be between Level 2 and 3, as defined in the WA OWRP.

Table 5-8: Key at-risk species potentially in Priority Protection Areas and open ocean

Species	Open ocean	Dampier Archipelago	Montebello AMP	Gascoyne AMP	Dampier AMP
Marine turtles (including foraging and inter-nesting areas and significant nesting beaches)	✓	✓	✓	✓	✓
Whale sharks (migration to and from waters at Ningaloo)	✓		✓	✓	
Seabirds and/or migratory shorebirds	✓	✓	✓	✓	✓
Cetaceans – migratory whales	✓	✓	✓	✓	✓
Cetaceans – dolphins and porpoises	✓	✓	✓	✓	✓
Dugongs	✓	✓			✓
Sea snakes	✓	✓	✓	✓	✓

The oiled wildlife response technique targets key wildlife populations at risk within Commonwealth open waters and the nearshore waters. Responding to oiled wildlife consists of eight key stages, as described in **Table 5-9** below.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

Table 5-9: Oiled wildlife response stages

Stage	Description
Stage 1: Wildlife first strike response	Gather situational awareness including potential wildlife assets at risk.
Stage 2: Mobilisation of wildlife resources	Resources include personnel, equipment and facilities.
Stage 3: Wildlife reconnaissance	Reconnaissance to identify potentially affected animals.
Stage 4: IAP wildlife sub-plan development	The IAP includes the appropriate response options for oiled wildlife, including wildlife priorities for protection from oiling; deterrence measures (see below); and recovery and treatment of oiled wildlife; resourcing of equipment and personnel. It includes consideration of deterrence practices such as 'hazing' to prevent fauna from entering areas potentially contaminated by spilled hydrocarbons, as well as dispersing, displacing or relocating fauna to minimise/prevent contact and provide time for clean-up.
Stage 5: Wildlife rescue and staging	This includes the different roles of finding oiled wildlife, capturing wildlife, and holding and/or transportation of wildlife to oiled wildlife facilities.
Stage 6: Establishment of an oiled wildlife facility	Treatment facilities would be required for the first-aid, cleaning and rehabilitation of affected animals. A vessel-based 'on-water' facility would likely need to be established to enable stabilisation of oiled wildlife before transport to a suitable treatment facility. Suitable staging sites in Exmouth and/or Onslow have been identified in the draft Regional Oiled Wildlife Response Operational Plan (OWROP), should a land-based site be required.
Stage 7: Wildlife rehabilitation	Considerations include a suitable rehabilitation centre and personnel, wildlife housing, record keeping and success tracking.
Stage 8: Oiled wildlife response termination	Once a decision has been made to terminate operations, the Incident Controller will stand down individual participating and supporting agencies.

Reconnaissance and primary response would be done during operational monitoring and surveillance activities. Where marine fauna is observed on water or transiting near or within the spill area, observations would be recorded through surveillance records. The shoreline assessments would be done in accordance with OM05, which would be used as a further tool to identify fauna and habitats contacted by hydrocarbons.

Staging sites would be established as forward bases for shoreline- or vessel-based field teams. Once recovered to a staging site, wildlife would be transported to the designated oiled wildlife facility or a temporary holding centre (before being transported to the oiled wildlife facility). Temporary holding centres are required when there is significant distance between a staging site and the oiled wildlife facility, to enable stabilisation of oiled animals. The oiled wildlife facility is the primary location where animals would be housed and treated. Sites proposed for staging a regional oiled wildlife response in Exmouth and/or Onslow have been identified.

To deploy a response appropriate to the nature and scale of the event, as well as scalable over time, Woodside would implement an oiled wildlife response in consultation with DBCA and use the capability outlined in the WA OWRP, with additional capability if required (e.g. volunteers) accessible through Woodside's *People & Global Capability Surge Labour Requirement Plan*.

The WA OWRP provides indicative oiled wildlife response levels (**Table 5-10**) and the resources likely to be needed at each increasing level of response.

Table 5-10: Indicative oiled wildlife response (OWR) level (adapted from the WA OWRP, 2014)

OWR Level	Indicative personnel numbers	Indicative duration	Indicative number of birds (non-threatened species)	Indicative number of birds (threatened species)	Turtles (hatchlings, juveniles, adults)	Cetaceans	Pinnipeds	Dugongs
Level 1	6	< 3 days	1–2/day < 5 total	None	None	None	None	None
Level 2	26	> 4–14 days	1–5/day < 20 total	None	< 20 hatchlings No juv/adults	None	None	None
Level 3	59	> 4–14 days	5–10/day	1–5/day < 10 total	< 5 juv/adults < 50 hatchlings	None	< 5	None
Level 4	77	> 4–14 days	5–10/day < 200 total	5–10/day	< 20 juv/adults < 500 hatchlings	< 5, or known habitats affected	5–50	Habitat affected only
Level 5	116	> 4–14 days	10–100/day > 200 total	10–50/day	> 20 juv/adults > 500 hatchlings	< 5 dolphins	> 50	Dugongs oiled
Level 6	122	> 4–14 days	> 100/day	10–50/day	> 20 juv/adults > 500 hatchlings	> 5 dolphins	> 50	Dugongs oiled

5.5.2 Environmental performance based on need

Table 5-11: Environmental Performance – Oiled Wildlife Response

Environmental Performance Outcome		Oiled Wildlife Response is conducted in accordance with the Western Australian Oiled Wildlife Response Plan (WAOWRP) to ensure it is conducted in accordance with legislative requirements to house, release or euthanise fauna under the Animal Welfare Act 2002.		
Control measure		Performance Standard		Measurement Criteria (Section 5.9)
15	Wildlife response equipment	15.1	Contracted capability to treat 100 individual fauna for immediate mobilisation to Response Priority Areas (RPAs)	1, 3A, 3B, 3C, 4
		15.2	Contracted capability to treat up to an additional 250 individual fauna within a five-day period.	
		15.3	National plan access to additional resources under the guidance of the DoT (up to a Level 5 oiled wildlife response as specified in the OWRP), with the ability to treat about 600 individual fauna by the time hydrocarbons contact the shoreline.	1, 3C, 4
		15.4	Vessels used in hazing/pre-emptive capture will approach fauna at slow speeds to ensure animals are not directed towards the hydrocarbons.	1, 3A, 3B, 4
		15.5	Facilities for the rehabilitation of oiled wildlife are operational 24/7 as per WAOWRP.	1, 3A, 4
16	Wildlife responders	16.1	2 OWR Team Members to lead the oiled wildlife operations who have completed an Oiled Wildlife Response Management course	1, 2, 3B
		16.2	Wildlife responders to be accessed through resource pool and additional agreements with specialist providers	1, 2, 3A, 3B, 3C, 4
		16.3	Operations conducted with advice from the DBCA Oiled Wildlife Advisor and in accordance with the processes and methodologies described in the WA OWRP and the relevant regional plan	1
		16.4	Open communication line to be maintained between IMT and infield operations to ensure awareness of progress against plan(s)	1, 3A, 3B

The resulting wildlife response capability has been assessed against the WCCS. The range of techniques provide an ongoing approach to response at identified RPAs.

Wildlife collection operations would be expected to peak between Day 3 and Day 14 and decrease thereafter. Additional personnel are unlikely to increase the net environmental benefit and this capability is considered to be a manageable balance between effectiveness and minimising environmental impact.

Under optimal conditions, during the surface release the capability available meets the need identified. It indicates that, the wildlife response capability has the following expected performance:

- Mobilisation and deployment of approximately 1-2 wildlife collection teams within the first 5 days of the incident
- Mobilisation and deployment of 1-2 central wildlife treatment and rehabilitation locations at Exmouth and/or Onslow in accordance with WA OWRP.

Woodside would establish a wildlife collection point at the RPA for identified oiled wildlife collection and sorting. From these locations, recovered wildlife would be transported to a central treatment location at Exmouth and/or Onslow.

5.6 Waste Management

Waste management is considered a support technique to wildlife response and shoreline clean-up. Waste generated and collected during the response that will require handling, management and disposal may consist of:

- Liquids (hydrocarbons and contaminated liquids) collected during shoreline clean-up and wildlife response; and/or
- Solids/semi-solids (oily solids, garbage, contaminated materials) and debris (e.g. seaweed, sand, woods, and plastics) collected during shoreline clean-up and wildlife response.

Expected waste volumes during an event are likely to vary depending on oil type, volume released, response techniques employed and how weathering of hydrocarbons. Waste management, handling and capacity should be scalable to ensure continuous response operations can be maintained.

All waste management activities will follow the Environment Protection (Controlled Waste) Regulations 2004 and the waste will be managed to minimise final disposal volumes. Waste treatment techniques will consider contaminated solids treatment to allow disposal to landfill and solids with high concentrations of hydrocarbon will be treated and recycled where possible or used in clean fill if suitable.

The waste products would be transported from response locations to the nearest suitable staging area/waste transfer station for treatment, disposal or recycling. Waste will be transferred with appropriately licensed vehicles. Containers will be available for temporary waste storage and will be:

- labelled with the waste type
- provided with appropriate lids to prevent waste being blown overboard
- banded if storing liquid wastes.
- processes will be in place for transfers of bulk liquid wastes and include:
 - inspection of transfer hose undertaken prior to transfer
 - watchman equipped with radio visually monitors loading hose during transfer
 - tank gauges monitored throughout operation to prevent overflow

The Oil Spill Preparedness Waste Management Support Plan details the procedures, capability and capacity in place between Woodside and its primary waste services contractor (Veolia Waste Management) to manage waste volumes generated from response activities.

5.6.1 Response need based on predicted consequence parameters

Table 5-12: Response Planning Assumptions – Waste Management

Response planning assumptions: Waste management	
Waste loading per m³ oil recovered (multiplier)	Shoreline clean-up (manual) – approx. 5-10x multiplier for oily solid and liquid wastes generated by manual clean-up
	Oiled wildlife response – approx. 1m ³ of oily liquid waste generated for each wildlife unit cleaned

5.6.2 Environmental performance based on need

Table 5-13: Environmental Performance – Waste Management

Environmental Performance Outcome		To minimise further impacts, waste will be managed, tracked and disposed of in accordance with laws and regulations.		
Control measure		Performance Standard		Measurement Criteria (Section 5.9)
17	Waste Management	17.1	Contract with waste management services for transport, removal, treatment and disposal of waste	1, 3A, 3B, 3C, 4
		17.2	Access to at least 213 m ³ of solid and liquid waste storage available within 2 days upon activation of 3 rd party contract.	
		17.3	Access to up to 675 m ³ by day 4.	
		17.4	Recovered hydrocarbons and wastes will be transferred to licensed treatment facility for reprocessing or disposal.	
		17.5	Response teams will segregate liquid and solid wastes at the earliest opportunity.	
		17.6	Waste management provider support staff available year-round to assist in the event of an incident with waste management as detailed in contract.	1, 3A, 3B
		17.7	Open communication line to be maintained between IMT and waste management services to ensure the reliable flow of accurate information between parties.	
		17.8	Waste management to be conducted in accordance with Australian laws and regulations	1, 3A, 3B, 3C, 4
		17.9	Waste management services available and employed during response	

The resulting waste management capability has been assessed against the WCCS. The range of techniques provide an ongoing approach to waste management at identified RPAs.

It indicates the waste management capability has the following expected performance:

- Woodside has assessed the existing capability available and considered potential alternative, additional and improved control measures.
- The waste management requirements of all credible spill scenarios are well within Woodside’s and its service providers existing capacity.
- No further control measures that may result in an increased environmental benefit that involve moderate to significant cost and/or dedication of resources have been adopted as the requirements of this technique does not justify the excessive costs of identified alternate, improved or additional controls.

5.7 Scientific monitoring

A scientific monitoring program (SMP) would be activated following a Level two or three unplanned hydrocarbon release, or any release event with the potential to contact sensitive environmental receptors. This would consider receptors at risk (ecological and socio-economic) for the entire predicted Environment that Maybe Affected (EMBA) and in particular, any identified Pre-emptive Baseline Areas (PBAs) for the credible spill scenario or other identified unplanned hydrocarbon releases associated with the operational activities (refer to **Table 2-1**).

The outputs of the stochastic hydrocarbon spill modelling were used to assess the environmental risk of the hydrocarbon affected area as delineated by the ecological impact EMBA and socio-cultural EMBA based on exceedance of environmental and social-cultural hydrocarbon threshold concentrations (refer to **Table 2-2** and see Section 4 and 6 of the Scarborough Seabed Intervention and Trunkline Installation activity EP for further information on applicable thresholds and the EMBA). The PAP credible spill scenarios (CS-01, CS-02 and CS-03) defines the combined EMBA which is the basis of the SMP approach presented in this section.

It should be noted the resulting SMP receptor locations differ from the Response Protection Areas presented and discussed in **Section 3** of this document due to the applicability of different hydrocarbon threshold levels. The SMP would be informed by the data collected via the operational monitoring program (OMP) studies; however, it differs from the OMP in being a long-term program independent of, and not directing, the operational oil spill response or monitoring of impacts from response activities (refer to **Section 5.1** for operational monitoring overview).

Key objectives of the Woodside oil spill SMP are:

- Assess the extent, severity and persistence of the environmental impacts from the spill event.
- Monitor subsequent recovery of impacted key species, habitats and ecosystems.

The SMP comprises ten targeted environmental monitoring programs to assess the condition of a range of physico-chemical (water and sediment) and biological (species and habitats) receptors including EPBC Act listed species, environmental values associated with protected areas and socio-economic values, such as fisheries. The ten SMPs are as follows:

- SM01 – Assessment of the presence, quantity and character of hydrocarbons in marine waters (linked to OM01 to OM03)
- SM02 – Assessment of the presence, quantity and character of hydrocarbons in marine sediments (linked to OM01 and OM05)
- SM03 – Assessment of impacts and recovery of subtidal and intertidal benthos
- SM04 – Assessment of impacts and recovery of mangroves/saltmarsh habitat
- SM05 – Assessment of impacts and recovery of seabird and shorebird populations
- SM06 – Assessment of impacts and recovery of nesting marine turtle populations
- SM07 – Assessment of impacts to pinniped colonies including haul-out site populations
- SM08 – Desktop assessment of impacts to other non-avian marine megafauna
- SM09 – Assessment of impacts and recovery of marine fish (linked to SM03)
- SM10 – Assessment of physiological impacts to important fish and shellfish species (fish health and seafood quality/safety) and recovery.

These SMPs have been designed to cover all key tropical and temperate habitats and species within Australian waters and broader, if required. A planning area for scientific monitoring is also identified to acknowledge potential hydrocarbon contact below the environmental threshold concentrations and beyond the EMBA. This planning area has been set with reference to the entrained low exposure value of 10 ppb detailed in NOPSEMA Bulletin #1 Oil Spill Modelling (2019), as shown in **Figure 5-1**.

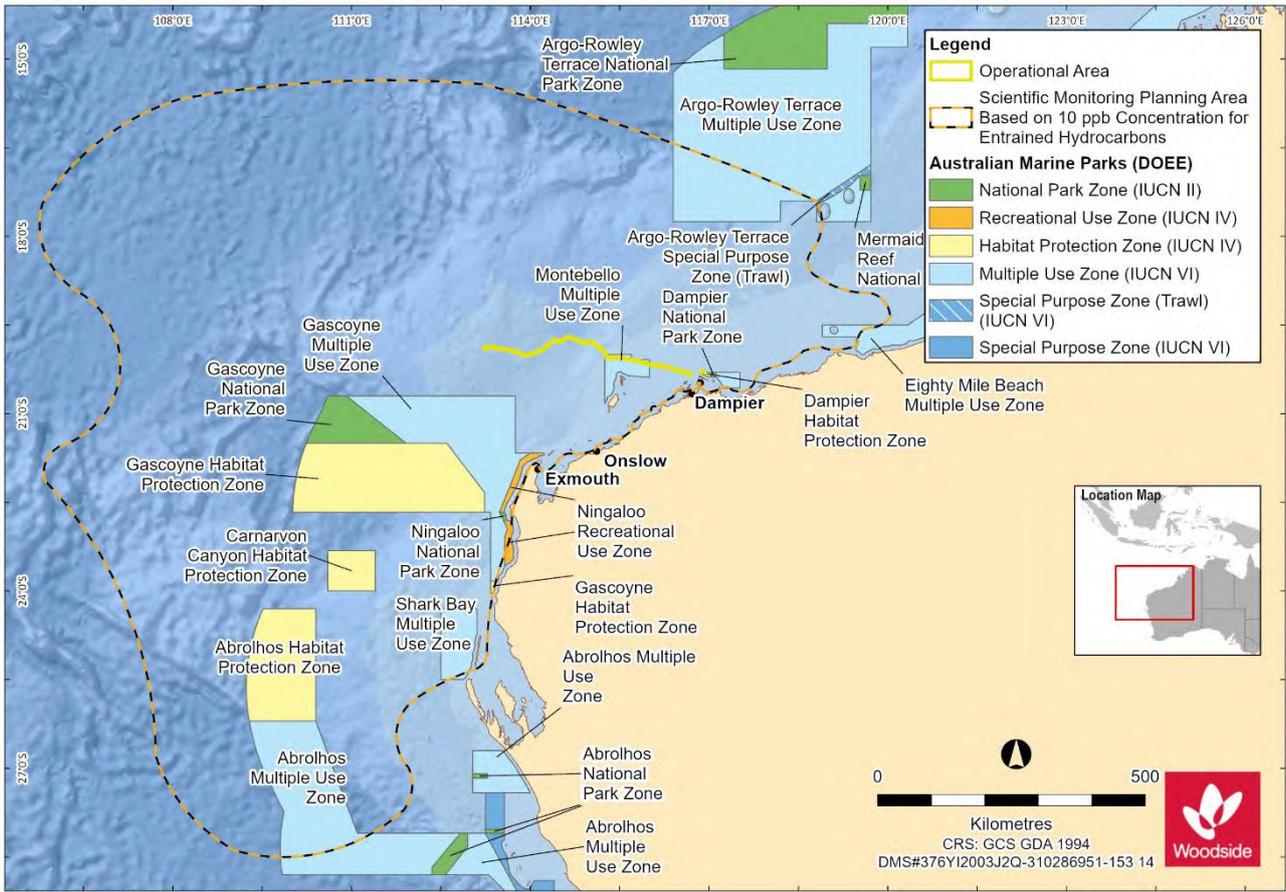

Figure 5-1: The planning area for scientific monitoring based on the area potentially contacted by the low (below ecological impact) entrained hydrocarbon threshold of 10 ppb representing the EMBA for the combined marine diesel credible spill scenarios (CS-01, CS-02 and CS-03)

Please note that **Figure 5-1** represents the overall combined extent of the marine diesel spill model outputs for the credible scenarios (CS-01, CS-02 and CS-03), based on a total of 100-200 replicate simulations over an annual period, and therefore represents the largest spatial boundaries of the spill combinations, not the spatial extent of a single spill.

5.7.1 Scientific monitoring deployment considerations

Table 5-14: Scientific monitoring deployment considerations

Scientific Monitoring Deployment Considerations	
Existing baseline studies for sensitive receptor locations predicted to be affected by a spill	<p>PBAs of the following two categories:</p> <ul style="list-style-type: none"> • PBAs within the predicted <10-day hydrocarbon contact time prediction: As part of this assessment, a desktop review was conducted of available and appropriate baseline data for key receptors for locations (if any) that are potentially impacted within 10 days of a spill (based on the EMBA). Furthermore, the need to conduct baseline data collection to address data gaps and demonstrate spill response preparedness is assessed (refer to Annex D). In the scenario, that baseline data needs are identified, planning for baseline data acquisition is typically commenced pre-PAP and the execution of studies undertaken considers the receptor type, seasonality and temporal assessment requirements and location conditions. • PBAs predicted >10 days to hydrocarbon contact: As part of this assessment, a desktop review is conducted of available and appropriate baseline data for key receptors for locations (if any) that are potentially impacted >10 days' time of a hydrocarbon spill event and documented (refer to Table 5-15). In the event of a spill, the SMP activation (as per the Scarborough Seabed Intervention and Trunkline Installation activity First Strike Response Plan) directs the SMP team to follow the steps outlined in the SMP Operational Plan. The steps include: the review of availability and type of existing baseline data, with particular reference to any Pre-emptive Baseline Areas (PBAs) identified as >10 days to hydrocarbon contact as predicted by forecast modelling trajectories. Such information is used to identify response phase PBAs and plan for the activation of SMPs for pre-emptive (i.e. pre-hydrocarbon contact) baseline assessment.
Pre-emptive Baseline in the event of a spill	Activation of SMPs in order to collect baseline data at sensitive receptor locations with predicted hydrocarbon contact time > 10 days (as documented in ANNEX C: Oil Spill Scientific monitoring Program).
Survey platform suitability and availability	In the event of the SMP activation, suitable survey platforms are available and can support the range of equipment and data collection methodologies to be implemented in nearshore and offshore marine environments.
Trained personnel to implement SMPs suitable and available.	Access to trained personnel and the sampling equipment contracted for scientific monitoring via a dedicated scientific monitoring program standby contract.
Met-ocean conditions	<p>The following met-ocean conditions have been identified to implement SMPs:</p> <ul style="list-style-type: none"> • Waves < 1 m for nearshore systems • Waves < 1.5 m for offshore systems • Winds < 20 knots • Daylight operations only. <p>SMP implementation will be planned and managed according to HSE risk reviews and the met-ocean conditions on a day to day basis by SMP operations.</p>

5.7.2 Response planning assumptions

Table 5-15: Scientific monitoring response planning assumptions

Response Planning Assumptions	
PBAs	<p>PBAs identified through the application of defined hydrocarbon impact thresholds during the Quantitative Spill Risk Assessment process and a consideration of the minimum time to contact at receptor locations fall into two categories:</p> <ul style="list-style-type: none"> • PBAs for which baseline data are planned for and data collection may commence pre-PAP (≤ 10 days minimum time to contact), where identified as a gap. • PBAs (> 10 days minimum time to contact) for which baseline data may be collected in the event of an unplanned hydrocarbon release. Response phase PBAs are prioritised for SMP activities due to vulnerability (i.e. time to contact and environmental sensitivity) to potential impacts from hydrocarbon contact and an identified need to acquire baseline data. <p>Time to hydrocarbon contact of > 10 days has been identified as a minimum timeframe within which it is feasible to plan and mobilise applicable SMPs and commence collection of baseline (pre-hydrocarbon contact) data, in the event of an unplanned hydrocarbon release from the Scarborough Seabed Intervention and Trunkline Installation activity.</p> <p>PBAs for Scarborough Seabed Intervention and Trunkline Installation activity are identified and listed in ANNEX D: Monitoring Program and Baseline Studies for the Petroleum Activities Program, Table D-1. The PBAs together with the situational awareness (from the operational monitoring) are the basis for the response phase SMP planning and implementation.</p>
Pre-Spill	<p>A review of existing baseline data for receptor locations with potential to be contacted by floating or entrained hydrocarbons at environmental thresholds within ≤ 10 days has identified the following based on the combined EMBA for the credible spill scenarios (CS-01, CS-02 and CS-03):</p> <ul style="list-style-type: none"> • Rankin Bank ⁸ • Dampier Archipelago • Montebello Islands and Montebello State Marine Park • Barrow Island and the Lowendal Islands • Pilbara Islands – Middle and Southern Island Groups • Ningaloo coast and the Muiron Islands (state marine park, AMP and WHA) <p>Australian Marine Parks (AMPs) potentially affected include:</p> <ul style="list-style-type: none"> • Dampier AMP • Montebello AMP • Gascoyne AMP <p>Note: The Australian Marine Parks (AMPs) are located in offshore, open waters where hydrocarbon exposure is possible on surface waters and in the upper water column (entrained hydrocarbons), only.</p>

⁸ Floating oil will contact submerged features in open ocean locations; therefore, only entrained hydrocarbon contact is predicted at ≤ 10 days. Predicted upper water column entrained hydrocarbons may extend to approximately 20 m depth and contact the submerged shoal benthic communities.

Response Planning Assumptions

In the Event of a Spill

Receptor locations with > 10 days to hydrocarbon contact, as well as the wider area, will be investigated and identified by the SMP team (in the Environment Unit of the Incident Control Centre (CIMT)) as the spill event unfolds and as the situational awareness provided by the OMPs permits delineation of the spill affected area (for example, updates to the spill trajectory tracking). The full list is presented in **ANNEX D: Monitoring Program and Baseline Studies for the Petroleum Activities Program**, based on the PAP credible spill scenarios (CS-01, CS-02 and CS-03) (**Table 2-1**).

To address the initial focus in a response phase SMP planning situation, receptor locations predicted to be contacted between > 10 days have been identified as follows:

- Glomar Shoal⁹
- Pilbara Islands – Northern Island Group
- Shark Bay outer barrier islands (Bernier and Dorre)
- Argo-Rowley Terrace AMP
- Shark Bay AMP
- Abrolhos AMP

The unfolding spill affected area predictions and confirmation of appropriate baseline data will determine the selection of receptor locations and SMPs to be activated in order to gather pre-emptive (pre-hydrocarbon contact) data. Refer to **ANNEX C: Oil Spill Scientific monitoring Program** for further details on the process for scientific monitoring plan implementation and delivery. The timing of SMP activation and mobilisation of the individual SMPs to undertake data collection will be decided and documented by the Woodside SMP team following the process outlined in the SMP Operational Plan.

In the event key receptors within geographic locations that are potentially impacted after ten days following a spill event or commencement of the spill and where adequate and appropriate baseline data are not available, there will be a response phase effort to collect baseline data for the following purposes:

- i. Priority will be given to the collection of baseline data for receptors predicted to be within the spill affected area prior to hydrocarbon contact. The process is initiated with the investigation of available baseline and time to hydrocarbon contact (>10 days which is sufficient time to mobilise SMP teams and acquire data before hydrocarbon contact). With reference to the Scarborough Seabed Intervention and Trunkline Installation activity, dependent on the location of the hydrocarbon release, priority would be focused on Dampier Archipelago, Montebello, Barrow and Lowendal Island Groups, Ningaloo Coast and the Muiron Islands.
- ii. Highly sensitive and/or valued habitats and communities in coastal waters will be prioritised for pre-emptive baseline surveys over open water areas of AMPs, such as Dampier and Montebello AMPs.
- iii. Collect baseline data for receptors predicted to be outside the spill affected area so reference datasets for comparative analysis with impacted receptor types can be assessed post-spill.

⁹ Floating oil will contact submerged features in open ocean locations; therefore, only entrained hydrocarbon contact is predicted at ≤ 10 days. Predicted upper water column entrained hydrocarbons may extend to approximately 20 m depth and contact the submerged shoal benthic communities.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

Response Planning Assumptions	
Baseline Data	<ul style="list-style-type: none"> A summary of the spill affected area and receptor locations as defined by the combined EMBA for the PAP credible spill scenarios (CS-01, CS-02 and CS-03), presented in the Scarborough Seabed Intervention and Trunkline Installation activity EP (Section 6). The key receptors at risk by location and corresponding SMPs based on the EMBA for the PAP are presented in ANNEX D: Monitoring Program and Baseline Studies for the Petroleum Activities Program, as per the PAP credible spill scenarios. This matrix maps the receptors at risk with their location and the applicable SMPs that may be triggered in the event of a Level two or three hydrocarbon release, or any release event with the potential to contact sensitive environmental receptors. Receptor locations and applicable SMPs are colour coded to highlight possible time to contact based on receptor locations identified as PBAs. The status of baseline studies relevant to the PAP are tracked by Woodside through the maintenance of a Corporate Environment Environmental Baseline Database (managed by the Woodside Environmental Science team), as well as accessing external databases such as the Department of Water and Environmental Regulation (WA) Index of Marine Surveys for Assessment (IMSA)¹⁰ (refer to ANNEX C: Oil Spill Scientific monitoring Program).

5.7.3 Summary – scientific monitoring

The resulting scientific monitoring capability has been assessed against the PAP credible spill scenarios for marine diesel. The range of strategies provide an ongoing approach to monitoring operations to assess and evaluate the scale and extent of impacts. All known reasonably practicable control measures have been adopted with the cost and organisational complexity of these options determined to be moderate and the overall delivery effectiveness determined to be medium. The SMP’s main objectives can be met, with no additional, alternative or improved control measures providing further benefit.

5.7.4 Response planning: need, capability and gap – scientific monitoring

The receptor locations identified in **ANNEX D: Monitoring Program and Baseline Studies for the Petroleum Activities Program** provide the basis of the SMPs likely to be selected and activated. Once the Woodside SMP Delivery team and Standby SMP contractor have been stood up and the exact nature and scale of the spill becomes known, the SMPs to be activated will be confirmed as per the process set out in the SMP Operational Plan.

Scope of SMP Operations in the event of a hydrocarbon spill

Receptor locations of interest for the SMP during the response phase in the event of a spill are:

- Dampier Archipelago
- Rankin Bank
- Montebello Islands and Montebello State Marine Park
- Barrow Island and the Lowendal Islands
- Pilbara Islands – Middle and Southern Island Groups
- Ningaloo Coast and Muiron Islands (State Marine Park, AMP and WHA)

Documented baseline studies are available for certain sensitive receptor locations including the Dampier Archipelago, Montebello Islands, Barrow Island, Lowendal Islands, Rankin Bank, Pilbara Islands – Middle and Southern Island Groups, and Ningaloo coast and the Muiron Islands (**ANNEX D: Monitoring Program and Baseline Studies for the Petroleum Activities Program, Table D-2**). The SMP approach in the response phase would still deploy SMP teams to maximise the opportunity to collect pre-emptive baseline data at sensitive receptor locations, i.e., the sections of the WA Coast not immediately contacted to hydrocarbons. As the exact locations where hydrocarbon contact occurs may be unpredictable, SM01 would be mobilised as a priority to be able to detect

¹⁰ <https://biocollect.ala.org.au/imsa#max%3D20%26sort%3DdateCreatedSort>

hydrocarbons and track the leading edge of the spill to verify where hydrocarbon contact occurs which will assist with where SMP resources are a priority need to obtain pre-emptive baseline data. The option analysis in **Section 6.7** considers ways to reduce the gap by considering alternate, additional, and/or improved control measures on each selected response strategy.

5.7.5 Environmental performance based on need

Table 5-16: Environment performance – scientific monitoring

Environmental Performance Outcome		Woodside can demonstrate preparedness to stand up the SMP to quantitatively assess and report on the extent, severity, persistence and recovery of sensitive receptors impacted from the spill event.		
Control measure		Performance Standard		Measurement Criteria
18	<ul style="list-style-type: none"> Woodside has an established and dedicated SMP team comprising the Environmental Science Team and additional Environment Advisers within the Health Safety Environment (HSE) Function. 	18.1	SMP team comprises a pool of competent Environment Advisers (stand up personnel) who receive training regarding the SMP, SMP activation and implementation of the SMP on an annual basis.	<ul style="list-style-type: none"> Training materials. Training attendance registers. Process that maps minimum qualification and experience with key SMP role competency and a tracker to manage availability of competent people for the SMP team including redundancy and rostering.
19	<ul style="list-style-type: none"> Woodside has contracted SMP service provider to provide scientific personnel to resource a base capability of one team per SMP (SM01-SM10, see ANNEX C: Oil Spill Scientific monitoring Program, Table C-2) as detailed in Woodside’s SMP standby contractor Implementation Plan, to implement the oil spill scientific monitoring programs. The availability of relevant personnel is reported to Woodside on a monthly basis via a simple report on the base-loading availability of people for each of the SMPs comprising field work for data collection (SMP resourcing report register). In the event of a spill and the SMP is activated, the base-loading availability of scientific personnel will be provided by SMP standby contractor for the individual SMPs and where gaps in resources are identified, SMP standby contractor/Woodside will seek additional personnel (if needed) from other sources including Woodside’s Environmental Services Panel. 	19.1	Woodside maintains the capability to mobilise personnel required to conduct scientific monitoring programs SM01 to SM10 (except desktop-based SM08): <ul style="list-style-type: none"> Personnel are sourced through the existing standby contract with SMP standby contractor, as detailed within the SMP Implementation Plan. Scientific Monitoring Program Implementation Plan describes the process for standing up and implementing the scientific monitoring programs. SMP team stand up personnel receive training regarding the stand up, activation and implementation of the SMP on an annual basis. 	<ul style="list-style-type: none"> OSPU Internal Control Environment tracks the quarterly review of the Oil Spill Contracts Master. SMP resource report of personnel availability provided by SMP contractor on monthly basis (SMP resourcing report register). Training materials. Training attendance registers. Competency criteria for SMP roles. SMP annual arrangement testing and reporting.
20	<ul style="list-style-type: none"> Roles and responsibilities for SMP implementation are captured in ANNEX C: Oil Spill Scientific monitoring Program, Table C-1 and the SMP team (as per the organisational structure of the CIMT) is outlined in SMP Operational Plan. Woodside has a defined Crisis and Incident Management structure including Source Control, Operations, Planning and Logistics functions to manage a loss of well control response. 	20.1	<ul style="list-style-type: none"> Woodside has established an SMP organisational structure and processes to stand up and deliver the SMP. 	<ul style="list-style-type: none"> SMP Oil Spill Scientific Monitoring Operational Plan. SMP Implementation Plan. SMP annual arrangement testing and reporting.

	<p>appropriate. Suitable vehicles and machinery for onshore access to nearshore SMP locations would be provided by Woodside's transport services contract and sourced from the wider market.</p> <ul style="list-style-type: none"> • Dedicated survey equipment requirements for scientific monitoring range from remote towed video and drop camera systems to capture seabed images of benthic communities to intertidal/onshore surveying tools such as quadrats, theodolites and spades/trowels, cameras and binoculars (specific survey equipment requirements are outlined in the relevant SMP methodologies (refer to ANNEX C: Oil Spill Scientific monitoring Program, Table C-2)). Equipment would be sourced through the existing SMP standby contract with Standby SMP contractor for SMP resources and if additional surge capacity is required this would be available through the other Woodside Environmental Services Panel Contractors and specialist contractors. Standby SMP contractor can also address equipment redundancy through either individual or multiple suppliers. MoUs are in place with marine sampling equipment suppliers and analytical laboratories (SMP resourcing report register). • Availability of SMP equipment for offshore/onshore scientific monitoring team mobilisation is within one week to ten days of the commencement of a hydrocarbon release. This meets the SMP mobilisation lead time that will support meeting the response objective of 'acquire, where practicable, the environmental baseline data prior to hydrocarbon contact required to support the post-response SMP. 			
22	<p>Woodside's SMP approach addresses the pre-PAP acquisition of baseline data for PBAs with ≤ 10 days if required following a baseline gap analysis process.</p> <p>Woodside maintains knowledge of Environmental Baseline data through:</p> <ul style="list-style-type: none"> • Documentation annual reviews of the Woodside Baseline Environmental Studies Database, and specific activity baseline gap analyses. • Accessing external databases such as the Department of Water and Environmental Regulation (WA) Index of Marine Surveys for Assessment (IMSA) (refer to ANNEX C: Oil Spill Scientific monitoring Program). 	22.1	<ul style="list-style-type: none"> • Annual reviews of environmental baseline data. • PAP specific Pre-emptive Baseline Area baseline gap analysis. 	<ul style="list-style-type: none"> • Annual review/update of Woodside Baseline Environmental Studies Database. • Desktop review to assess the environmental baseline study gaps completed prior to EP submission. • Accessing baseline knowledge via the SMP annual arrangement testing.

Environmental Performance Outcome		SMP plan to acquire response phase monitoring targeting pre-emptive data achieved.		
Control measure		Performance Standard		Measurement Criteria
23	Woodside's SMP approach addresses: <ul style="list-style-type: none"> Scientific data acquisition for PBAs >10 days to hydrocarbon contact and activated in the response phase and Transition into post-response SMP monitoring. 	23.1	PBA baseline data acquisition in the response phase If baseline data gaps are identified for PBAs that has predicted hydrocarbon contact (contact time > 10 days), there will be a response phase effort to collect baseline data with priority in implementing SMPs given to receptors where pre-emptive baseline data can be acquired or improved. SMP team (within the Environment Unit of the CIMT) contribute SMP component of the CIMT Planning Function in development of the IAP.	<ul style="list-style-type: none"> Response SMP plan. Woodside's online Incident Management System Records. SMP component of the Incident Action Plan.
		23.2	Post Spill contact For the receptors contacted by the spill in where baseline data are available, SMPs programs to assess and monitor receptor condition will be implemented post spill (i.e. after the response phase).	<ul style="list-style-type: none"> SMP planning document. SMP Decision Log. IAPs.

Environmental Performance Outcome		Implementation of the SMP (response and post-response phases).		
Control measure		Performance Standard		Measurement Criteria
24	<ul style="list-style-type: none"> Scientific monitoring will address quantitative assessment of environmental impacts of a level two or three spill or any release event with the potential to contact sensitive environmental receptors. The SMP comprises ten targeted environmental monitoring programs. SMP supporting documentation: (1) Oil Spill Scientific Monitoring Operational Plan; (2) SMP Implementation Plan and (3) SMP Process and Methodologies Guideline. The Oil Spill Scientific Monitoring Operational Plan details the process of SMP selection, input to the IAP to trigger operational logistic support services. Methodology documents for each of the ten SMPs are accessible detailing equipment, data collection techniques and the specifications required for the survey platform support. The SMP standby contractor holds a Woodside SMP implementation plan detailing activation processes, linkage with the Woodside SMP team and the general principles for the planning and mobilisation of SMPs to deliver the individual SMPs activated. Monthly resourcing report are issued by the SMP standby contractor (SMP resourcing report register). All SMP documents and their status are tracked via SMP document register. 	24.1	Implementation of SM01 SM01 will be implemented to assess the presence, quantity and character of hydrocarbons in marine waters during the spill event in nearshore areas.	Evidence SM01 has been triggered: <ul style="list-style-type: none"> Documentation as per requirements of the SMP Operational Plan. Woodside's online Incident Management System Records. SMP component of the IAP. SMP data records from field.
		24.2	Implementation of SM02 to SM10 SM02-SM10 will be implemented in accordance with the objectives and activation triggers as per ANNEX C: Oil Spill Scientific monitoring Program, Table C-2.	Evidence SMPs have been triggered: <ul style="list-style-type: none"> Documentation as per requirements of the SMP Operational Plan. Woodside's online Incident Management System Records. SMP component of the IAP. SMP Data records from field.
		24.3	Termination of SMP plans The Scientific Monitoring Program will be terminated in accordance with termination triggers for the SMPs detailed in ANNEX C: Oil Spill Scientific monitoring Program, Table C-2 , and the Termination Criteria Decision-tree for Oil Spill Environmental Monitoring (ANNEX C: Oil Spill Scientific monitoring Program, Figure C-3):	Evidence of Termination Criteria triggered: <ul style="list-style-type: none"> Documentation and approval by relevant persons/ organisations to end SMPs for specific receptor types.

This document is protected by copyright. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

5.8 Incident Management System

The Incident Management System (IMS) is both a control measure and a measurement criterion. As a control measure the IMS function is to prompt, facilitate and record the completion of three key response planning processes detailed below. As a measurement criterion the IMS records the evidence of the timeliness of all response actions included in the environmental performance standards and the plans used of the PAP. As the IMS does not directly remove hydrocarbons spilled into the marine environment there is no direct relationship to the response planning need.

5.8.1 Incident action planning

The CIMT will be required to collect and interpret information from the scene of the incident to determine support requirements to the site based IMT, develop an incident action plan (IAP) and assist the IMT with the execution of that plan. The site-based incident controller (IC) may request the CIMT to complete notifications internally within Woodside, to persons/ organisations and government agencies as required. Depending on the type and scale of the incident either the CIMT Duty Manager (DM) or IC will be responsible for ensuring the development of the IAP. Incident Action Planning is an ongoing process that involves continual review to ensure techniques to control the incident are appropriate to the situation at the time.

5.8.2 Operational NEBA process

In the event of a response Woodside will confirm the response techniques adopted at the time of Environment Plan/Oil Pollution Emergency Plan (EP/OPEP) acceptance remain appropriate to reduce the consequences of the spill. This process verifies there is a continuing net environmental benefit associated with continuing the response technique through the operational NEBA process. This process manages the environmental risks and impacts of response techniques during the spill response, an operational NEBA will be undertaken throughout the response, for each operational period.

The operational NEBA will consider the risks and benefits of conducting a response activity. For example, if vessels are required for access to nearshore or onshore areas, anchoring locations will be selected to minimise disturbance to benthic habitats. Vessel cleanliness would be commensurate with the receiving environment. The operational NEBA will consider the risks and benefits of conducting other response techniques.

The operational NEBA process is also used to terminate a response. Using data from operational and scientific monitoring activities the response to a hydrocarbon spill will be terminated in accordance with the termination process outlined in the Oil Pollution Emergency Arrangements (Australia). In effect the operational NEBA will determine whether there is net environmental benefit to continue response operations.

5.8.3 Consultation engagement process

Woodside will ensure persons/ organisations are engaged during the spill response in accordance with internal standards as outlined in **Table 5-17**. This process requires that Woodside will:

- Undertake all required notifications (including government notifications) for persons/ organisations in the region (identified in the First Strike Plan). This includes notification to mariners to communicate navigational hazards introduced through response equipment and personnel.
- In the event of a response, identify and engage with relevant persons/ organisations and continually assess and review.

5.8.4 Environmental performance based on need

Table 5-17: Environmental Performance – Incident Management System

Environmental Performance Outcome		To support the effectiveness of all other control measures and monitor/record the performance levels achieved.			
Control measure		Performance Standard		Measurement Criteria (Section 5.9)	
25	Operational NEBA	25.1	Confirm that the response techniques adopted at the time of acceptance remain appropriate to reduce the consequences of the spill within 24 hours.	1, 3A	
		25.2	Record the evidence and justification for any deviation from the planned response activities.		
		25.3	Record the information and data from operational and scientific monitoring activities used to inform the NEBA.		
26	Stakeholder engagement	26.1	Prompt and record all notifications (including government notifications) for persons/ organisations in the region are made		
		26.2	In the event of a response, identification of relevant stakeholders will be re-assessed throughout the response period.		
		26.3	Undertake communications in accordance with: <ul style="list-style-type: none"> • Woodside Crisis Management Functional Support Team Guideline – Reputation • External Communication and Continuous Disclosure Procedure • External Stakeholder Engagement Procedure 		
27	Personnel required to support any response	27.1	Action planning is an ongoing process that involves continual review to ensure techniques to control the incident are appropriate to the situation at the time.		1, 3B
		27.2	A duty roster of trained and competent people will be maintained to ensure that minimum manning requirements are met all year round.		3C
		27.3	Immediately activate the IMT with personnel filling one or more of the following roles: <ul style="list-style-type: none"> • Operations Duty Manager • Operations Coordinator • Deputy Operations Coordinator • Planning Coordinator • Logistics (materials, aviation, marine and support positions) • Management Support • Health and Safety Advisor • Environment Duty Manager • People Coordinator • Public Information Coordinator • Intelligence Coordinator; and • Finance Coordinator. 		1, 2, 3B, 3C, 4
		27.4	Collect and interpret information from the scene of the incident to determine support requirements to the site based IMT, develop an Incident Action Plan (IAP) and assist with the execution of that plan.		
		27.5	Security and emergency management (S&EM) advisors will be integrated into the CIMT to monitor performance of all functional roles.		
		27.6	Continually communicate the status of the spill and support Woodside to determine the most appropriate response by delivering on the responsibilities of their role.		
		27.7	Follow the OPEA, Operational Plans, FSPs, support plans and the IAPs developed.	1, 2, 3A, 4	
		27.8	Contribute to Woodside’s response in accordance with the aims and objectives set by the Duty Manager.	1, 2, 3B, 3C, 4	

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

5.9 Measurement criteria for all response techniques

Woodside ensures compliance with environmental performance outcomes and standards through four primary mechanisms. The performance tables aforementioned identify which of these four mechanisms monitors the readiness and records the effectiveness and performance of the control measures adopted.

1. The Incident Management System

The Incident Management System (IMS) supports the implementation of the Incident and Crisis Management Procedure. The IMS provides a near real-time, single source of information for monitoring and recording an incident and measuring the performance of those control measures.

The Incident and Crisis Management Procedure defines the management framework, including roles and responsibilities, to be applied to any size incident (including hydrocarbon spills). The organisational structure required to manage an incident is developed in a modular fashion and is based on the specific requirements of each incident. The structure can be scaled up or down.

The Incident Action Plan (IAP) process formally documents and communicates the:

- Incident objectives;
- Status of assets;
- Operational period objectives;
- Response techniques (defined during response planning); and
- The effectiveness of response techniques.

The information captured in the IMS (including information from personal logs and assigned tasks/close outs) confirms the response techniques implemented remain appropriate to reduce the consequences of the spill. The system also records all information and data that can be used to support the site based IMT, development and the execution of the IAP.

2. The S&EM Competency Dashboard

The S&EM competency dashboard records the number of trained and competent responders available across Woodside, and some external providers, to participate in a response.

This number varies dependent on expiry of competency certificates, staff attrition, internal rotations, leave and other absences. As such the Dashboard is designed to identify the minimum manning requirements and to identify sufficient redundancy to cater for the variances listed above.

Figure 5-2 shows the minimum manning numbers for the different hydrocarbon spill response roles and the number of qualified persons against those roles.

Woodside's pool of trained responders is composed of but not limited to personnel from the following organisations:

- Woodside internal
- Australian Marine Oil Spill Centre (AMOSC) core group
- AMOSC
- Oil Spill Response Limited (OSRL)
- Marine Spill Response Corporation (MSRC)
- AMSA
- Woodside contracted workforce

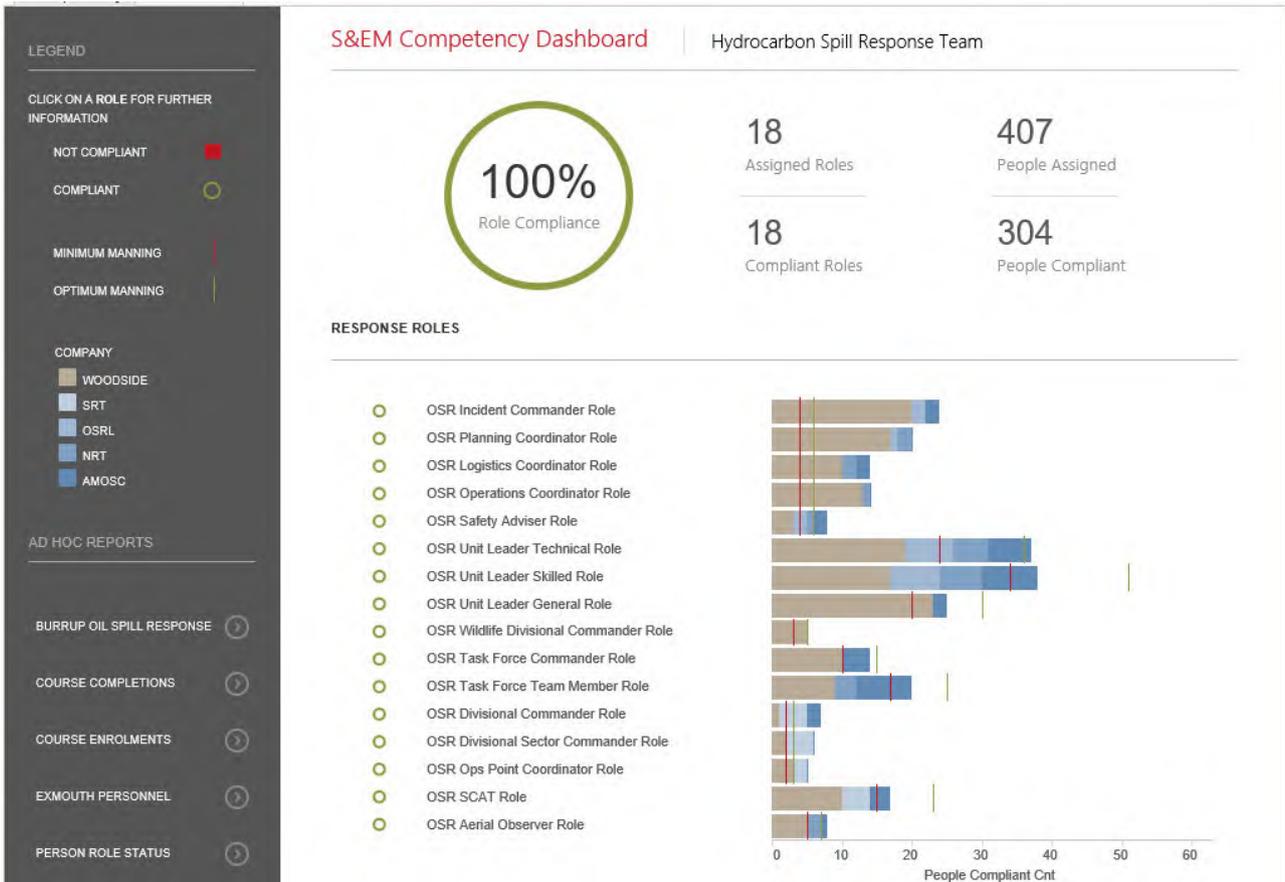

Figure 5-2: Example screen shot of the hydrocarbon spill preparedness (HSP) competency dashboard

The Dashboard is one of Woodside’s key means of monitoring its readiness to respond. It also and shows Woodside can meet the requirements of the environmental performance standard related to filling certain response roles.

Figure 5-3 shows deeper dive into the Ops Point Coordinator role and the training modules required to show competence.

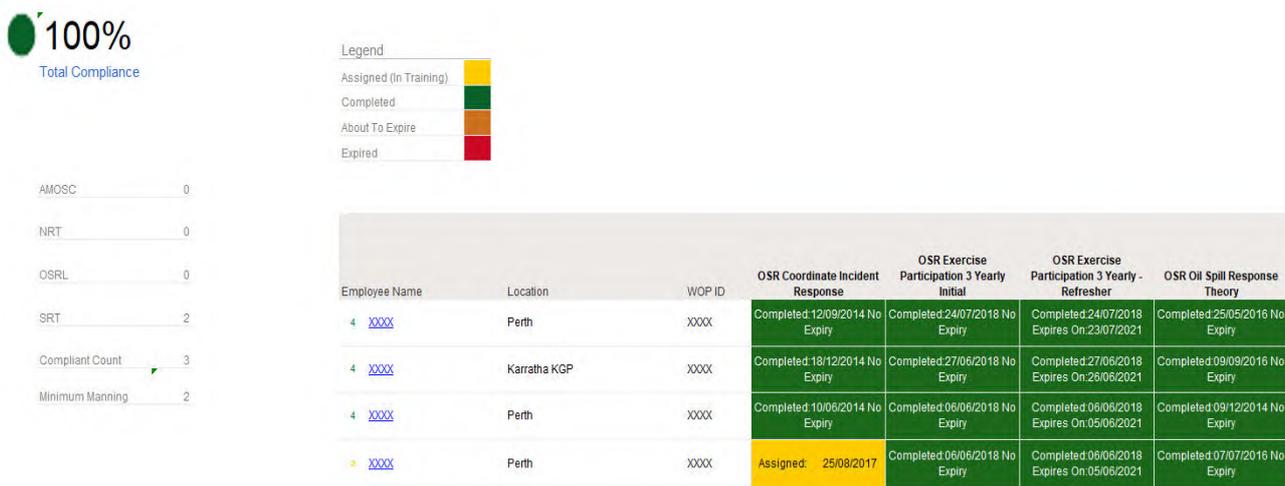

Figure 5-3: Example screen shot for the Ops Point Coordinator role

3. The Hydrocarbon Spill Preparedness ICE Assurance Process

The Hydrocarbon Spill Response Team has developed a Hydrocarbon Spill Preparedness and Response Internal Control Environment (ICE) process to align and feed into the Woodside Management System Assurance process for hydrocarbon spill. The process tracks compliance over four key control areas:

- a) **Plans** – Ensures all plans (including: Oil Pollution Emergency Arrangements, first strike response plans, operational plans, support plans and [tactical response plans](#) in [Annex E](#)) are current and in line with regulatory and internal requirements.
- b) **Competency** – Ensures the competency dashboard is up to date and there are the minimum competency numbers across CIMT, Crisis Management Team (CMT) and hydrocarbon spill response roles. The hydrocarbon spill training plan and exercise schedule, including testing of arrangements is also tracked. The Testing of Arrangements (TOA) register tracks the testing of all hydrocarbon spill response arrangements, key contracts and agreements in place with internal and external parties to ensure compliance.
- c) **Capability** – Tracks and monitors capability that could be required in a hydrocarbon incident, including but not limited to: integrated fleet¹¹ vessel schedule, dispersant availability, rig/vessels monitoring, equipment stockpiles, tracking buoy locations and the CIMT duty roster.
- d) **Compliance & Assurance** – Ensures all regulator inspection outcomes are actioned and closed out, the global legislation register is up to date and the key assurance components are tracked and managed. Assurance activities (including Audits) conducted on memberships with key Oil Spill Response Organisations (OSROs) including AMOSC and OSRL are also tracked and recorded in the ICE.

The ICE assurance process records how each commitment listed in the performance tables above is managed to ensure ongoing compliance monitoring. The level of compliance can be reviewed in real time and is reported on a monthly basis through the S&EM Function.

The completion of the assurance checks (over and above the ICE process) is also applied via the Woodside Integrated Risk & Compliance System (WiRCs) and subject to the requirements of Woodside's Provide Assurance Procedure.

4. The Hydrocarbon Spill Preparedness and Response Procedure

This procedure sets out how to plan and prepare for a liquid hydrocarbon spill to the marine environment. (Note, this procedure does not apply to scenarios relating to gas releases in the marine environment).

This procedure details the:

- Requirement for an Oil Pollution Emergency Plan (OPEP) to be developed, maintained, reviewed, and approved by appropriate regulators (where applicable) including:
 - Defining how spill scenarios are developed on an activity specific basis;
 - Developing and maintaining all hydrocarbon spill related plans;
 - Ensuring the ongoing maintenance of training and competency for personnel;
 - Developing the testing of spill response arrangements; and
 - Maintaining access to identified equipment and personnel.
- Planning for hydrocarbon spill response preparedness
- Accountabilities for hydrocarbon spill response preparedness
- Spill training requirements
- Requirements for spill exercising / testing of spill response arrangements

¹¹ The Integrated fleet consists of vessels from multiple operators that have been contracted to Woodside to undertake a number of duties including hydrocarbon spill response

- Spill equipment and services requirements.

The procedure also details the roles and responsibilities of the dedicated Woodside Hydrocarbon Spill Preparedness team. This team is responsible for:

- Assuring that Woodside hydrocarbon spill responders meet competency requirements.
- Establishing the competency requirements, annual training schedule and a training register of trained personnel.
- Establishing and maintaining the total numbers of trained personnel required to provide an effective response to any hydrocarbon spill incident.
- Ensuring equipment and services contracts are maintained
- Establishing OPEPs
- Establishing OPEAs
- Priority response receptor determination
- ALARP determination
- Ensuring compliance and assurance is undertaken in accordance with external and internal requirements.

6 ALARP EVALUATION

This Section should be read in conjunction with **Section 5** which is the capability planned for this activity.

6.1 Monitor and evaluate – ALARP assessment

Alternative, Additional and Improved options have been identified and assessed against the base capability described in **Section 5** with those that have been selected for implementation highlighted in green. Items highlighted in red have been considered and rejected on the basis that they are not feasible, the costs are clearly disproportionate to the environmental benefit, and/or the option is not reasonably practical. Control measures where there is not a clear justification for their inclusion or exclusion may be subject to a detailed ALARP assessment.

6.1.1 Monitor and Evaluate – Control Measure Options Analysis

6.1.1.1 Alternative Control Measures

Alternative Control Measures considered					
<i>Alternative, including potentially more effective and/or novel control measures are evaluated as replacements for an adopted control</i>					
Option considered	Environmental consideration	Feasibility	Approximate cost	Assessment conclusions	Implemented
Aerostat (or similar inflatable observation platform) for localised aerial surveillance.	Lead time to Aerostat surveillance is disproportionate to the environmental benefit. The system also provides a very limited field of visibility around the vessel it is deployed from.	Long lead time to access (>10 days). Each system would require an operator to interpret data and direct vessels accordingly. Requires multiple systems for shoreline use.	Purchase cost per system approx. A\$300,000.	This option is not adopted as the minimal environmental benefit gained is disproportionate to the cost and complexity of its implementation.	No

6.1.1.2 Additional Control Measures

Additional Control Measures considered					
<i>Additional control measures are evaluated in terms of them reducing an environmental impact or an environmental risk when added to the existing suite of control measures</i>					
Option considered	Environmental consideration	Feasibility	Approximate cost	Assessment conclusions	Implemented
Additional personnel trained to use systems.	Current arrangement provides an environmental benefit in the availability of trained personnel facilitating access to monitoring data used to inform all other response techniques. No improvement required.	No improvement can be made, all personnel in technical roles e.g. intelligence unit are trained and competent on the software systems. Personnel are trained and exercised regularly. Use of the software and systems forms part of regular work assignments and projects.	Cost for training in-house staff would be approx. A\$25,000.	This option is not adopted as the current capability meets the need.	No
Additional satellite tracking buoys to enable greater area coverage.	Increased capability does not provide an environmental benefit compared to the disproportionate cost in having an additional contract in place.	Tracking buoy on location at manned facility, additional needs are met from Woodside owned stocks in King Bay Support Base (KBSB) and Exmouth or can be provided by service provider.	Cost for an additional satellite tracking buoy would be A\$200 per day or A\$6000 to purchase.	This option is not adopted as the current capability meets the need, but additional units are available if required.	No
Additional trained aerial observers.	Woodside has access to a pool of trained, competent observers at strategic locations to ensure timely and sustainable response. Additional observers are available through current contracts with AMOSC and OSRL.	Aviation standards and guidelines ensure all aircraft crews are competent for their roles. Woodside maintains a pool of trained and competent aerial observers with various home base locations to be called upon at the time of an incident. Regular audits of oil spill response organisations ensure training and competency is maintained.	Cost for additional trained aerial observers would be A\$2000 per person per day.	This option is not adopted as the current capability meets the need, but additional observers are available via response contractors if required.	No

6.1.1.3 Improved Control Measures

Additional Control Measures considered					
<i>Additional control measures are evaluated in terms of them reducing an environmental impact or an environmental risk when added to the existing suite of control measures</i>					
Option considered	Environmental consideration	Feasibility	Approximate cost	Assessment conclusions	Implemented
Faster turnaround time from modelling contractor.	Improved control measure does not provide an environmental benefit compared to the disproportionate cost in having an additional contract in place.	External contractor on CIMT roster to be called as soon as required. However initial information needs to be gathered by CIMT team to request an accurate model. External contractor has	Modelling service with a faster activation time would be achieved via membership of an alternative modelling service at an annual cost of A\$50,000 for 24hr access plus an initial A\$5000 per modelling run.	This option is not adopted as the minimal environmental benefit gained is disproportionate to the cost and the challenge of collecting essential	No

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

Additional Control Measures considered					
<i>Additional control measures are evaluated in terms of them reducing an environmental impact or an environmental risk when added to the existing suite of control measures</i>					
		person on call to respond from their own location.		data/implementing reliable modelling in shorter timeframes.	
Night time aerial surveillance.	The risk of undertaking the aerial observations at night is disproportionate to the limited environmental benefit. The images would be of low quality and as such the variable is not adopted.	Flights will only occur when deemed safe by the pilot. The risk of night operations is disproportionate to the benefit gained, as images from sensors (IR, UV, etc.) will be low quality. Flight time limitations will be adhered to.	No improvement can be made without risk to personnel health and safety and breaching Woodside's Golden Rules.	This option is not adopted as the safety considerations outweigh any environmental benefit gained.	No
Faster mobilisation time (for water quality monitoring).	Due to the restriction on accessing the spill location on Day one there is no environmental benefit in having vessels available from day one. The cost of having dedicated equipment and personnel is disproportionate to the environmental benefit. The availability of vessels and personnel meets the response need. Shortening the timeframes for vessel availability would require dedicated response vessels on standby in KBSB. The cost and organisational complexity of employing two dedicated response vessels (approximately \$15M/year per vessel) is considered disproportionate to the potential environmental benefit to be realised by adopting this delivery options.	Operations are not feasible on day 1 as the hydrocarbon will take time to surface, and volatility has potential to cause health concerns within the first 24 hours of the response.	Cost for purchase of equipment approx. A\$200,000. Ongoing costs per annum for cost of hire and pre-positioning for life of asset/activity would be larger than the purchase cost. Dedicated equipment and personnel, living locally and on short notice to mobilise. The cost would be approx. A\$1 m per annum, which is disproportionate to the incremental benefit this would provide, assets are already available on day 1. 2 integrated fleet vessels are available from day 1, however these could be tasked with other operations.	This option is not adopted as the area could not be accessed earlier due to safety considerations. Additionally, the cost and complexity of implementation outweighs the benefits.	No

6.1.2 Selected control measures

Following review of alternative, additional and improved control measures, the following controls were selected for implementation for the PAP.

- Alternative
 - None selected
- Additional
 - None selected
- Improved
 - None selected

6.2 Source control via Vessel SOPEP - ALARP assessment

Alternative, Additional and Improved options have been assessed against the base capability described in Section 5 with those that have been selected for implementation highlighted in green. Items highlighted in red have been considered and rejected on the basis that they are not feasible, the costs are disproportionate to the environmental benefit, and/or the option is not reasonably practical. Control measures where there is not a clear justification for their inclusion or exclusion may be subject to a detailed ALARP assessment.

6.2.1 Source Control via Vessel SOPEP – Control Measure Options Analysis

6.2.1.1 Alternative Control Measures

Alternative Control Measures considered				
<i>Alternative, including potentially more effective and/or novel control measures are evaluated as replacements for an adopted control</i>				
Option considered	Environmental consideration	Feasibility	Cost	Implemented
No reasonably practical alternative control measures identified.				N/A

6.2.1.2 Additional Control Measures

Additional Control Measures considered				
<i>Additional control measures are evaluated in terms of them reducing an environmental impact or an environmental risk when added to the existing suite of control measures</i>				
Option considered	Environmental consideration	Feasibility	Cost	Implemented
No reasonably practical alternative control measures identified.				N/A

6.2.1.3 Improved Control Measures

Improved Control Measures considered				
<i>Improved control measures are evaluated for improvements they could bring to the effectiveness of adopted control measures in terms of functionality, availability, reliability, survivability, independence and compatibility</i>				
Option considered	Environmental consideration	Feasibility	Cost	Implemented
No reasonably practical alternative control measures identified.				N/A

6.2.2 Selected control measures

Following review of alternative, additional and improved control measures, the following controls were selected for implementation for the PAP.

- Alternative
 - None selected
- Additional
 - None selected
- Improved

6.3 Shoreline Protection and Deflection - ALARP Assessment

Alternative, Additional and Improved options have been identified and assessed against the base capability described in **Section 5** with those that have been selected for implementation highlighted in green. Items highlighted in red have been considered and rejected on the basis that they are not feasible, the costs are clearly disproportionate to the environmental benefit, and/or the option is not reasonably practical. Control measures where there is not a clear justification for their inclusion or exclusion may be subject to a detailed ALARP assessment.

6.3.1 Existing Capability – Shoreline Protection and Deflection

Woodside’s existing level of capability is based on internal and third-party resources that are available 24 hours, 7 days per week. The capability presented below is displayed as ranges to incorporate operational factors such as weather, crew/vessel/aircraft/vehicle location and duties, survey or classification society inspection requirements, overflight/port/quarantine permits and inspections, crew/pilot duty and fatigue hours, refuelling/re-stocking provisions, and other similar logistic and operational limitation that are beyond Woodside’s direct control.

6.3.2 Response Planning: Scarborough Seabed Intervention and Trunkline Installation – Shoreline Protection and Deflection

Planning for shoreline protection is based upon identification of Response Protection Areas (RPAs) from deterministic modelling and the logistics associated with deploying protection at these locations. The response planning scenarios indicate that this would require effective mobilisation to priority shorelines and maintenance of protection until operational monitoring confirms that the locations were no longer at risk. Woodside has identified the RPAs from deterministic modelling results provided from specific scenarios.

The control measures selected provide capability to mobilise shoreline protection equipment within 24 hours.

Modelling for CS-01 indicates that the shortest timeframe for shoreline contact at the Dampier Archipelago is 2.2 days. No shoreline impact is predicted for CS-02 and CS-03.

The existing capability is considered sufficient to mobilise and deploy protection at all identified RPAs prior to hydrocarbon contact. In the event of a real spill, protection activities will be guided by predictive modelling, direct observation/surveillance and remote sensing methods (OM01, OM02 and OM03) which will be employed from the outset of a spill to track the oil and assess receptors at risk. This will then trigger the undertaking of pre-emptive assessments of sensitive receptors at risk (OM04). OM04 would only be undertaken in liaison with WA DoT. Due to potentially high levels of volatiles from a spill of marine diesel, shoreline protection and deflection operations would only be undertaken if safety of responders could be ensured.

TRPs exist for many of the RPAs identified. The plans identify values and sensitivities that would be protected at each location. Modelling does not predict that all priority protection shorelines will be at risk of contact at the same time. Therefore, to allow for the best use of available shoreline protection and deflection resources, operational monitoring (OM01, OM02 and OM03) will inform the response, targeting RPAs where contact is predicted. **Table 6-1** below outlines the capability required (number of RPAs predicted to be impacted) against the capability available (number of shoreline protection and deflection operations that can be mobilised and deployed). As can be seen from the table below, Woodside’s capability exceeds the response planning need identified for shoreline protection and deflection operations at identified RPAs.

Table 6-1: Response planning – shoreline protection and deflection

Shoreline Protection & Deflection (SPD)	Day	Week	Week	Week	Month	Month	Month							
	1	2	3	4	5	6	7	2	3	4	2	3	4	
Oil on shoreline (from deterministic modelling) m ³	0	3	0	0	0	0	0	0	0	0	0	0	0	0
A Capability Required														
A1 Number of RPAs contacted (> 100 g/m ²) – Marine diesel release (CS-01)	0	1	0	0	0	0	0	0	0	0	0	0	0	0
B Capability Available (operations per day)														
B1 SPD operations available – per day (lower)	0	1	1	2	2	4	6	70	70	70	330	330	330	
B2 SPD operations available – per day (upper)	1	2	3	4	6	8	10	84	84	84	336	336	336	
C Capability Gap (operations per day)														
C1 SPD operations gap – per day (lower)	0	0	0	0	0	0	0	0	0	0	0	0	0	
C2 SPD operations gap – per day (upper)	0	0	0	0	0	0	0	0	0	0	0	0	0	

A1 – the number of Response Protection Areas contacted by surface hydrocarbons above 100 g/m²

B1 and B2 – the upper and lower number of shoreline protection and deflection operations available (based on response planning assumptions in **Section 0**),

C1 and C2 – the gap between the upper and lower number of shoreline protection and deflection operations required in A1 compared to the operations available in B1 and B2

Table 6-2: RPAs for Scarborough Seabed Intervention and Trunkline Installation

Areas of coastline contacted	Conservation status	IUCN protection category	CS-01	
			Minimum time to shoreline contact (above 100 g/m ²) in days ⁽¹²⁾	Maximum shoreline accumulation (above 100 g/m ²) in m ³ ⁽¹³⁾
Dampier Archipelago	National Heritage Property	N/A	2.2	3 m ³

¹² This volume and time represent the first time to contact on defined shoreline polygon and the maximum volume ashore for that 24 hour period.

¹³ This volume and time represent the maximum volume ashore on defined shoreline polygon for any 24 hour time period

Table 6-3: Indicative Tactical response plan, objectives and methods for RPAs with predicted contact

Tactical Response Plan	Response aims and methods
Legendre Island – Dampier	<p>First response aim: Ongoing operational monitoring and evaluation of the hydrocarbon spill to adapt aims and response tactics to the evolving nature of the incident and to assist in locating relevant booming areas.</p> <p>Second response aim: Protection of sensitive shorelines (mangrove) at Legendre Island through use of shoreline booms. Formation types to deploy will be dependent on the time available until the hydrocarbon impacts the shoreline and local geographical and tidal/weather conditions</p> <p>Third response aim: Clean-up of the shoreline. Manual clean up techniques, use of mechanical recovery methods and techniques where appropriate</p> <p>Fourth response aim: Collection and specialist cleaning/rehabilitation of oiled wildlife</p> <ul style="list-style-type: none"> • Relevant permissions must be sought from DBCA to carry out any response operations within the limits of the area • In the event that the existing Woodside equipment stockpile at the King Bay Supply Base becomes exhausted, Woodside has an MOU with AMSA and the DoT to provide surplus equipment from their stockpile. Additionally, Woodside is a member of both AMOSC and OSRL and has the ability to call upon their relevant technical advisory services and equipment stockpiles 24/7. <p>NOTE: This TRP should be considered a draft until it has been verified and tested.</p>
Rosemary Island – Dampier	<p>First response objective: Ongoing operational monitoring and evaluation of the hydrocarbon spill to adapt aims and response tactics to the evolving nature of the incident and to assist in locating relevant booming areas</p> <p>Second response objective: Recovery of floating oil at sea where possible through the use of skimming systems and other appropriate recovery devices to reduce shoreline impact</p> <p>Third response objective: Protection of sensitive shorelines at Rosemary Island through use of shoreline booms. Formation types to deploy will be dependent on the time available until the hydrocarbon impacts the shoreline and local geographical and tidal/weather conditions</p> <p>Fourth response objective: Clean-up of the shoreline. Manual clean up techniques, use of mechanical recovery methods and techniques where appropriate</p> <ul style="list-style-type: none"> • Relevant permissions must be sought from DBCA to carry out any response operations within the limits of the area • In the event that the existing Woodside equipment stockpile at the King Bay Supply Base becomes exhausted, Woodside has an MOU with AMSA and the DoT to provide surplus equipment from their stockpile. Additionally, Woodside is a member of both AMOSC and OSRL and has the ability to call upon their relevant technical advisory services and equipment stockpiles 24/7. <p>NOTE:</p> <ul style="list-style-type: none"> • See Port of Dampier MOPP page 113 for Rosemary Island response plan. • Dependent on seasonality presence of sensitive receptors, the strategies to either protect or clean-up the shorelines will be decided through NEBA. • This TRP should be considered a draft until it has been verified and tested.

Pre-emptive mobilisation of equipment and personnel would commence as soon as practicable prior to oil contact. Additional resources would be mobilised depending on the scale of the event to increase the length or number of shorelines being protected.

This document is protected by copyright. No part of this document may be reproduced, adapted, transmitted, or stored in any form by any process (electronic or otherwise) without the specific written consent of Woodside. All rights are reserved. Document to be read in conjunction with Scarborough Seabed Intervention and Trunkline Installation Environment Plan.

A shoreline protection and deflection response would be launched and any additional TRPs drafted only when operational monitoring (OM02 and OM03) and modelling (OM01) indicate that contact could occur at RPA(s). The outputs from the monitoring will inform the need for and/or direct any additional response techniques and, additionally, if/when the spill enters State Waters and control of the incident passes to WA DoT.

6.3.3 Shoreline Protection and Deflection – Control Measure Options Analysis

6.3.3.1 Alternative Control Measures

Alternative Control Measures Considered					
<i>Alternative, including potentially more effective and/or novel control measures are evaluated as replacements for an adopted control</i>					
Option considered	Environmental consideration	Feasibility	Approximate cost	Assessment conclusions	Implemented
Pre-position equipment at Response Protection Areas (RPAs)	Additional environmental benefit of having equipment prepositioned is considered minor. Equipment is currently available to RPAs and additional shorelines, within estimated minimum times until shoreline contact at RPAs, enabling mobilisation of the selected delivery options.	The incremental environmental benefit associated with these delivery options is considered minor and unlikely to reduce the environmental consequence of a significant hydrocarbon release beyond the adopted delivery options. Considering the highly unlikely nature of a significant hydrocarbon release and the costs and organisational complexity associated with prepositioning and maintenance of equipment, the sacrifice is considered disproportionate to the limited environmental benefit that might be realised. Furthermore, these options would conflict with the mutual aid philosophy being adopted under the selected delivery options. The selected delivery options for shoreline protection and deflection meet the relevant objectives of this control measure and do not require prepositioned or additional equipment in Exmouth.	Total cost to preposition protection/ deflection packages at each site of potential impact would be approx. A\$6100 per package per day.	This option is not adopted as the existing capability meets the need.	No

6.3.3.2 Additional Control Measures

Additional Control Measures Considered					
<i>Additional control measures are evaluated in terms of them reducing an environmental impact or an environmental risk when added to the existing suite of control measures</i>					
Option considered	Environmental consideration	Feasibility	Approximate cost	Assessment conclusions	Implemented
Supplemented stockpiles of equipment in Exmouth to protect additional shorelines	Additional equipment would increase the number of receptor areas that could be protected from hydrocarbon contact. However, current availability of personnel and equipment is capable of protecting up to 30 km of shoreline, commensurate with the scale and progressive nature of shoreline impact. Additional stocks would be made available from international sources if long term up scaling were necessary. A reduction in environmental consequence from a 'B' rating (serious long-term impacts) is unlikely to be realised as a result of having more equipment available locally.	The incremental environmental benefit associated with these delivery options is considered minor and unlikely to reduce the environmental consequence of a significant hydrocarbon release beyond the adopted delivery options. Considering the highly unlikely nature of a significant hydrocarbon release and the costs and organisational complexity associated with prepositioning and maintenance of equipment, the sacrifice is considered disproportionate to the limited environmental benefit that might be realised. Furthermore, these options would conflict with the mutual aid philosophy being adopted under the selected delivery options. The selected delivery options for shoreline protection and deflection meet the relevant objectives of this control measure and do not require prepositioned or additional equipment in Exmouth.	Total cost for purchase supplemental protection and deflection equipment would be approx. A\$455,000 per package.	This option is not adopted as the existing capability meets the need.	No
Additional trained personnel	The level of training and competency of the response personnel ensures the shoreline protection and deflection operation is delivered with minimum secondary impact to the environment. Training additional personnel does not provide an increased environmental benefit.	Additional personnel required to sustain an extended response can be sourced through the Woodside <i>People & Global Capability Surge Labour Requirement Plan</i> . Additional personnel sourced from contracted OSRO's (OSRL/AMOSC) to manage other responders. Response personnel are trained and exercised regularly in shoreline response techniques and methods. All personnel involved in a response will receive a full operational/safety brief prior to commencing operations.	Additional Specialist Personnel would cost A\$2000 per person per day.	This option is not adopted as the existing capability meets the need.	No

6.3.3.3 Improved Control Measures

Improved Control Measures considered					
Improved control measures are evaluated for improvements they could bring to the effectiveness of adopted control measures in terms of functionality, availability, reliability, survivability, independence and compatibility					
Option considered	Environmental consideration	Feasibility	Approximate cost	Assessment conclusions	Implemented
Faster response/ mobilisation time	Hydrocarbons are predicted to strand after a period of approximately 2.5 days therefore allowing enough time to re-locate existing equipment, personnel and other resources to the most appropriate areas.	Response teams, trained personnel, contracted oil spill response service providers, government agencies and the associated mitigation equipment required to enact an initial protection and deflection response will be available for mobilisation within 24-48hrs of activation. Additional equipment from existing stockpiles and oil spill response service providers can be on scene within days. Given modelling does not predict shoreline accumulation until approx. 2.5 days, Woodside considers that there is sufficient time for deployment of protection and deflection operations prior to impact.	The cost of establishing a local stockpile of new mitigation equipment (including protection and deflection boom) closer to the expected hydrocarbon stranding areas is not commensurate with the need.	This option is not adopted as the existing capability meets the need.	No

6.3.4 Selected Control Measures

Following review of alternative, additional and improved control measures as outlined above, the following controls were selected for implementation for the PAP.

- Alternative
 - None selected
- Additional
 - None selected
- Improved
 - None selected

6.4 Shoreline clean-up – ALARP Assessment

Alternative, Additional and Improved options have been identified and assessed against the base capability described in **Section 5** with those that have been selected for implementation highlighted in green. Items highlighted in red have been considered and rejected on the basis that they are not feasible, the costs are clearly disproportionate to the environmental benefit, and/or the option is not reasonably practical. Control measures where there is not a clear justification for their inclusion or exclusion may be subject to a detailed ALARP assessment.

6.4.1 Existing Capability – Shoreline Clean-up

Woodside's existing level of capability is based on internal and third-party resources that are available 24 hours, 7 days per week. The capability presented below is displayed as ranges to incorporate operational factors such as weather, crew/vessel/aircraft/vehicle location and duties, survey or classification society inspection requirements, overflight/port/quarantine permits and inspections, crew/pilot duty and fatigue hours, refuelling/re-stocking provisions, and other similar logistic and operational limitation that are beyond Woodside's direct control.

6.4.2 Response planning: Scarborough Seabed Intervention and Trunkline Installation - Shoreline Clean-up

Woodside has assessed existing capability against the WCCS and has identified that the range of techniques provide an ongoing approach to shoreline clean-up at identified RPAs.

Modelling for CS-01 indicates that the shortest timeframe for shoreline contact at the Dampier Archipelago is 2.2 days. No shoreline impact is predicted for CS-02 and CS-03.

The maximum shoreline accumulation volumes from CS-01 have been presented for any given day/ week / month of the response to provide a single response planning scenario so that it provides a worst-case scenario for planning purposes, as outlined below in **Table 6-4**. The existing shoreline clean-up capability would be sufficient by Day 2. From Day 2 onwards, the available response capability is predicted to be sufficient as the number of personnel and equipment mobilised to RPAs increases. The volumes of accumulated oil and the required scale of the response will also depend on the success of other offshore techniques preventing shoreline oiling occurring; other offshore response techniques and their associated reduction in oil volumes have not been taken into account when determining the shoreline clean-up requirements in **Table 6-4** and the approach is therefore conservative.

The potential scale and remoteness of a response precludes the stockpiling or prepositioning of equipment specific to shorelines. The most significant constraint is accommodation and transport of personnel in the Exmouth region to undertake clean-up operations and to manage wastes generated during the response effort. From previous assessment of facilities in the Exmouth region, Woodside estimates that current accommodation can cater for a range of 500-700 personnel per day.

Woodside has identified several options which could be mobilised to achieve defined response objectives. Evaluation considers the benefit in terms of the time to respond and the scale of response made possible by each option. The evaluation of possible alternative, additional and improved control measures is summarised in **Section 6.4.3**.

Table 6-4: Response Planning – Shoreline Clean-up

Shoreline clean-up (Phase 2)	Day	Week	Week	Week	Month	Month	Month	Month							
	1	2	3	4	5	6	7	2	3	4	2	3	4	5	
Oil on shoreline (from deterministic modelling) m ³															
Shoreline accumulation (above 100 g/m ²) – m ³	0	3	0	0	0	0	0	0	0	0	0	0	0	0	0
Oil remaining following response operations – m ³	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
A Capability Required (number of operations)															
A1 Shoreline clean-up operations required (lower)	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
A2 Shoreline clean-up operations required (upper)	0	1	0	0	0	0	0	0	0	0	0	0	0	0	0
B Capability Available (number of operations)															
B1 Shoreline clean-up operations available - Stage 2 - Manual (lower)	0	1	3	5	8	12	15	105	105	105	560	560	560	560	
B2 Shoreline clean-up operations available - Stage 2 - Manual (upper)	0	2	5	8	10	15	20	140	140	140	560	560	560	560	
C Capability Gap															
C1 Shoreline clean-up operations gap (lower)	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0
C2 Shoreline clean-up operations gap (upper)	0	0	0	0	0	0	0	0	0	0	0	0	0	0	0

A1 and A2 – the number of Shoreline Clean-up operations required based on the hydrocarbon volumes ashore above 100 g/m²

B1 and B2 – the upper and lower number of shoreline clean-up operations available (based on response planning assumptions in **Section 5.2**),

C1 and C2 – the gap between the upper and lower number of shoreline clean-up operations required in A1 and A2 compared to the operations available in B1 and B2

Table 6-5: RPAs for Scarborough Seabed Intervention and Trunkline Installation

Areas of coastline contacted	Conservation status	IUCN protection category	CS-01	
			Minimum time to shoreline contact (above 100 g/m ²) in days ⁽¹⁴⁾	Maximum shoreline accumulation (above 100 g/m ²) in m ³ ⁽¹⁵⁾
Dampier Archipelago	National Heritage Property	N/A	2.2	3 m ³

¹⁴ This volume and time represent the first time to contact on defined shoreline polygon and the maximum volume ashore for that 24 hour period.

¹⁵ This volume and time represent the maximum volume ashore on defined shoreline polygon for any 24 hour time period

This document is protected by copyright. 6.4.3 Shoreline Clean-up – Control measure options analysis

6.4.3.1 Alternative Control Measures

Alternative Control Measures Considered

Alternative, including potentially more effective and/or novel control measures are evaluated as replacements for an adopted control

Option considered	Environmental consideration	Feasibility	Approx. cost	Implemented
No reasonably practical alternative control measures identified.				

6.4.3.2 Additional Control Measures

Additional Control Measures Considered

Additional control measures are evaluated in terms of them reducing an environmental impact or an environmental risk when added to the existing suite of control measures

Option considered	Environmental consideration	Feasibility	Approximate cost	Implemented
Train additional personnel in shoreline clean-up	No environmental benefit is gained through having additional personnel trained. Current personnel arrangements meet the ongoing need for trained personnel for all scenarios.	It is feasible to train more personnel in shoreline clean-up, however, additional personnel required to sustain an extended response can be sourced through the Woodside People & Global Capability Surge Labour Requirement Plan. This surge capacity is not expected to be required for any of the scenarios.	Given there is no environmental benefit, any costs are disproportionate to the benefit gained.	No
Additional trained personnel deployed	Maintaining control of 200 competent personnel is deemed manageable and appropriate for this activity. Additional personnel conducting clean-up activities may be able to complete the clean-up in a shorter timeframe, however managing a smaller, targeted response is expected to achieve an environmental benefit through ensuring the shoreline clean-up response is suitable and scalable for the shoreline substrate and sensitivity type. This will ensure there is no increased impact from the shoreline clean-up through the presence of unnecessary personnel and equipment. Therefore, no environmental benefit is expected from deploying additional trained personnel past 200.	It is feasible to deploy additional trained personnel in addition to the 200 already sourced through existing arrangements. These could be sourced through existing contracts with oil spill response organisations, labour hire organisations and environmental panel contractors. This additional capacity is not expected to be required for any of the scenarios.	Given there is no environmental benefit, any costs are disproportionate to the benefit gained.	No

6.4.3.3 Improved Control Measures

Improved Control Measures considered

Improved control measures are evaluated for improvements they could bring to the effectiveness of adopted control measures in terms of functionality, availability, reliability, survivability, independence and compatibility

Option considered	Environmental consideration	Feasibility	Approximate cost	Implemented
Faster response/mobilisation time	No environmental benefit is identifiable due to the timeframes to contact.	It is feasible to preposition equipment and personnel in Dampier to allow a faster mobilisation time. However, response teams, trained personnel, contracted oil spill response service providers, government agencies and the associated mitigation equipment required to enact an initial response will be available for mobilisation within the first week. Additional equipment from existing stockpiles and oil spill response service providers can be on scene within 6 days.	Given there is no environmental benefit, any costs are disproportionate to the benefit gained.	No

6.4.4 Selected control measures

Following review of alternative, additional and improved control measures, the following controls were selected for implementation for the PAP.

- Alternative
 - None selected
- Additional

- None selected
- Improved
 - None selected

6.5 Wildlife Response – ALARP Assessment

Alternative, Additional and Improved options have been identified and assessed against the base capability described in **Section 5** with those that have been selected for implementation highlighted in green. Items highlighted in red have been considered and rejected on the basis that they are not feasible, the costs are clearly disproportionate to the environmental benefit, and/or the option is not reasonably practical. Control measures where there is not a clear justification for their inclusion or exclusion may be subject to a detailed ALARP assessment.

6.5.1 Existing Capability – Wildlife Response

Woodside's existing level of capability is based on internal and third-party resources that are available 24 hours, 7 days per week. The capability presented below is displayed as ranges to incorporate operational factors such as weather, crew/vessel/aircraft/vehicle location and duties, survey or classification society inspection requirements, overflight/port/quarantine permits and inspections, crew/pilot duty and fatigue hours, refuelling/re-stocking provisions, and other similar logistic and operational limitation that are beyond Woodside's direct control.

6.5.2 Oiled Wildlife Response – Control measure options analysis

6.5.2.1 Alternative Control Measures

Alternative Control Measures Considered				
<i>Alternative, including potentially more effective and/or novel control measures are evaluated as replacements for an adopted control</i>				
Option considered	Environmental consideration	Feasibility	Approximate cost	Implemented
Direct contracts as service providers	This option duplicates the capability accessed through AMOSC and OSRL and would compete for the same resources. Does not provide a significant increase in environmental benefit.	These delivery options provide increased effectiveness through more direct communication and control of specialists. However, no significant net benefit is anticipated.	Duplication of capability – already subscribed to through contracts with AMOSC and OSRL	No

6.5.2.2 Additional Control Measures

Additional Control Measures Considered				
<i>Additional control measures are evaluated in terms of them reducing an environmental impact or an environmental risk when added to the existing suite of control measures</i>				
Option considered	Environmental consideration	Feasibility	Approximate cost	Implemented
Additional wildlife treatment systems	Current arrangements allow for all wildlife to be treated. Hydrocarbon is only limited to open water above the impact threshold. Therefore, there is no environmental benefit for having additional wildlife treatment systems as current capability meets the need.	Current arrangements allow response equipment and personnel to be delivered by day one, scaling up by day six, enough to treat up to 600 wildlife. An additional wildlife treatment system is feasible and would potentially reduce the time to deploy additional wildlife systems.	Given there is no environmental benefit, any costs are disproportionate to the benefit gained.	No
Additional trained wildlife responders	Current numbers meet the needs required and additional personnel are available through existing contracts with oil spill response organisations and environmental panel contractors. Numbers of oiled wildlife are expected to be low in the remote offshore setting of the oiled wildlife response, given the distance from known aggregation areas. The potential environmental benefit of training additional personnel is expected to be low.	Providing additional trained wildlife responders is feasible, however current capacity provides the capacity to treat approximately 600 wildlife units (primarily avian fauna) by day six, with additional capacity available from OSRL.	Given there is no environmental benefit, any costs are disproportionate to the benefit gained.	No

6.5.2.3 Improved Control Measures

Improved Control Measures considered				
<i>Improved control measures are evaluated for improvements they could bring to the effectiveness of adopted control measures in terms of functionality, availability, reliability, survivability, independence and compatibility</i>				
Option considered	Environmental consideration	Feasibility	Approximate cost	Implemented
Faster mobilisation time for wildlife response through pre-positioned equipment and personnel.	Response time is limited by specialist personnel mobilisation time. Current timing is sufficient considering there is no potential for shoreline receptors to be contacted.	The selected delivery options provide the capacity to mobilise an oiled wildlife response capable of treating up to 600 wildlife from at least day six and exceeds the estimated Level 4 OWR response thought to be applicable. This delivery option provides the maximum expertise pooled across the	The cost of having dedicated equipment and personnel available to respond faster is considered disproportionate to the environmental benefit.	No

	This control measure provides increased effectiveness through faster mobilisation of specialists. However, no significant net environmental benefit is expected due to shoreline stranding times.	participating operators, backed up by the international resources provided by OSRL. The availability of vessels and personnel meets the response need.		
--	---	---	--	--

6.5.3 Selected control measures

Following review of alternative, additional and improved control measures, the following controls were selected for implementation for the PAP.

- Alternative
 - None selected
- Additional
 - None selected
- Improved
 - None selected

6.6 Waste Management – ALARP Assessment

Alternative, Additional and Improved options have been identified and assessed against the base capability described in **Section 5** with those that have been selected for implementation highlighted in green. Items highlighted in red have been considered and rejected on the basis that they are not feasible, the costs are clearly disproportionate to the environmental benefit, and/or the option is not reasonably practical. Control measures where there is not a clear justification for their inclusion or exclusion may be subject to a detailed ALARP assessment.

6.6.1 Existing Capability – Waste Management

Woodside's existing level of capability is based on internal and third-party resources that are available 24 hours, 7 days per week. The capability presented below is displayed as ranges to incorporate operational factors such as weather, crew/vessel/aircraft/vehicle location and duties, survey or classification society inspection requirements, overflight/port/quarantine permits and inspections, crew/pilot duty and fatigue hours, refuelling/re-stocking provisions, and other similar logistic and operational limitation that are beyond Woodside's direct control.

6.6.2 Waste Management – Control measure options analysis

6.6.2.1 Alternative Control Measures

Alternative Control Measures Considered <i>Alternative, including potentially more effective and/or novel control measures are evaluated as replacements for an adopted control</i>				
Option considered	Environmental consideration	Feasibility	Approx. cost	Implemented
No reasonably practical alternative control measures identified.				

6.6.2.2 Additional Control Measures

Additional Control Measures Considered <i>Additional control measures are evaluated in terms of them reducing an environmental impact or an environmental risk when added to the existing suite of control measures</i>				
Option considered	Environmental consideration	Feasibility	Approximate cost	Implemented
Increased waste storage capability	The procurement of waste storage equipment options on the day of the event will allow immediate response and storage of collected waste. The environmental benefit of immediate waste storage is to reduce ecological consequence by safely securing waste, allowing continuous response operations to occur.	Access to Veolia's storage options provides the resources required to store and transport sufficient waste to meet the need. Access to waste contractors existing facilities enables waste to be stockpiled and gradually processed within the regional waste handling facilities. Additional temporary storage equipment is available through existing contract and arrangements with OSRL. Existing arrangements meet identified need for the PAP.	The cost of having increased waste storage capability is considered disproportionate to the environmental benefit.	No

6.6.2.3 Improved Control Measures

Improved Control Measures considered <i>Improved control measures are evaluated for improvements they could bring to the effectiveness of adopted control measures in terms of functionality, availability, reliability, survivability, independence and compatibility</i>				
Option considered	Environmental consideration	Feasibility	Approximate cost	Implemented
Faster response time	The access to Veolia waste storage options provides the resources to store and transport waste, permitting the wastes to be stockpiled and gradually processed within the regional waste handling facilities. Bulk transport to Veolia's licensed waste management facilities would be undertaken via controlled-waste-licensed vehicles and in accordance with Environmental Protection (Controlled Waste) Regulations 2004. The environmental benefit from successful waste storage will reduce pressure on the treatment and disposal facilities reducing ecological consequences by safely securing waste. In addition, waste storage and transport will allow continuous response operations to occur. This delivery option would increase known available storage, eliminating the risk of additional resources not being available at the time of the event. However, the environmental benefit of Woodside procuring additional waste storage is considered minor as the risk of additional storage not being available at the time of the event is considered low and existing arrangements provide adequate storage to support the response.	Woodside already maintains an equipment stockpile in Exmouth to enable shorter response times to incidents. This stockpile includes temporary waste storage equipment. Woodside has access to stockpiles of waste storage and equipment in Dampier and Exmouth through existing contracts and arrangements.	The incremental benefit of having a dedicated local Woodside owned stockpile of waste equipment and transport is considered minor and cost is considered disproportionate to the benefit gained given predicted shoreline contact times.	No

6.6.3 Selected control measures

Following review of alternative, additional and improved control measures, the following controls were selected for implementation for the PAP.

- Alternative
 - None selected
- Additional
 - None selected
- Improved
 - None selected

6.7 Scientific Monitoring – ALARP Assessment

Alternative, additional and improved options have been identified and assessed against the base capability described in **Section 5** with those that have been selected for implementation highlighted in green. Items highlighted in red have been considered and rejected on the basis that they are not feasible, the costs are clearly disproportionate to the environmental benefit, and/or the option is not reasonably practical. Control measures where there is not a clear justification for their inclusion or exclusion may be subject to a detailed ALARP assessment.

6.7.1 Scientific monitoring – control measure options analysis

6.7.1.1 Alternative Control Measures

Evaluate Alternative, Additional and Improved Control Measures					
Alternative Control Measures considered					
<i>Alternative, including potentially more effective and/or novel control measures are evaluated as replacements for an adopted control</i>					
Ref	Control Measure Category	Option considered	Implemented	Environmental Consideration	Feasibility/Cost
SM01	System	Analytical laboratory facilities closer to the likely spill affected area	No	SM01 water quality monitoring requires water samples to be transported to NATA rated laboratories in Perth or interstate. Consider the benefit of laboratory access and transportation times to deliver water samples and complete lab analysis. There is a time lag from collection of water samples to being in receipt of results and confirming hydrocarbon contact to sensitive receptors). The environmental consideration of having access to suitable laboratory facilities in Exmouth or Karratha to carry out the hydrocarbon analysis would provide faster turnaround in reporting of results only by a matter of days (as per the time to transport samples to laboratories).	Laboratory facilities and staff available at locations closer to the spill affected area can reduce reporting times only to a moderate degree (days) with associated high costs of maintaining capability do not improve the environmental benefit.
SM01	System	Dedicated contracted SMP vessel (exclusive to Woodside)	No	Would provide faster mobilisation time of scientific monitoring resources, environmental benefit associated with faster mobilisation time would be minor compared to selected options.	Chartering and equipping additional vessels on standby for scientific monitoring has been considered. The option is reasonably practicable but the sacrifice (charter costs and organisational complexity) is significant, particularly when compared with the anticipated availability of vessels and resources within the required timeframes. The selected delivery provides capability to meet the scientific monitoring objectives, including collection of pre-emptive data where baseline knowledge gaps are identified for receptor locations where spill predictions of time to contact are > 10 days. The effectiveness of this alternative control (weather dependency, availability and survivability) is rated as very low. The cost and organisational complexity of employing a dedicated response vessel is considered disproportionate to the potential environmental benefit by adopting these delivery options.

6.7.1.2 Additional Control Measures

Additional Control Measures considered					
<i>Additional control measures are evaluated in terms of them reducing an environmental impact or an environmental risk when added to the existing suite of control measures</i>					
Ref	Control Measure Category	Option considered	Implemented	Environmental Consideration	Feasibility / Cost
SM01	System	Determine baseline data needs and provide implementation plan in the event of an unplanned hydrocarbon release	Yes	Address resourcing needs to collect post spill (pre-contact) baseline data as spill expands in the event of an instantaneous MDO release from the PAP activities.	Woodside relies on existing environmental baseline for receptors which have predicted hydrocarbon contact (above environment threshold) < 10 days and acquiring pre-emptive data in the event of an instantaneous MDO release from the PAP activities based on receptors predicted to have hydrocarbon contact > 10 days. Ensure there is appropriate baseline for key receptors for all geographic locations that are potentially impacted < 10 days of spill event, where practicable. Address resourcing needs to collect pre-emptive baseline as spill expands in the event of an instantaneous marine diesel release from the PAP activities.

6.7.1.3 Improved control measures

Improved control measures considered – No reasonably practicable improved Control Measures identified.

6.7.2 Selected control measures

Following review of alternative, additional and improved control measures, the following controls were selected for implementation for the PAP:

- Alternative:
 - None selected.
- Additional:
 - Determine baseline data needs and provide implementation plan in the event of an unplanned hydrocarbon release.
- Improved:
 - None selected.

6.7.3 Operational plan

Key actions from the Scientific Monitoring Program Operational Plan for implementing the response are outlined in **Table 6-6**.

Table 6-6: Scientific monitoring program operational plan actions

Responsibility	Action
Activation	
CIMT Planning (CIMT Planning – Environment Unit)	Mobilises SMP Lead/Manager and SMP Coordinator to the CIMT Planning function.
CIMT Planning (CIMT Planning – Environment Unit) (SMP Lead/Manager and SMP Coordinator)	Constantly assesses all outputs from OM01, OM02 and OM03 (Section 5 and ANNEX B: Operational Monitoring Activation and Termination Criteria) to determine receptor locations and receptors at risk. Confirm sensitive receptors likely to be exposed to hydrocarbons, timeframes to specific receptor locations and which SMPs are triggered. Review baseline data for receptors at risk.
CIMT Planning (CIMT Planning – Environment Unit) (SMP Lead/Manager and SMP Coordinator)	SMP co-ordinator stands up SMP standby contractor as the SMP Contractor. Stands up subject matter experts, if required.
CIMT Planning (CIMT Planning – Environment Unit) (SMP Lead/Manager SMP Coordinator, SMP Standby Contractor, SMP Manager)	Establish if, and where, pre-contact baseline data acquisition is required. Determines practicable baseline acquisition program based on predicted timescales to contact and anticipated SMP mobilisation times. Determines scope for preliminary post-contact surveys during the Response Phase. Determines which SMP activities are required at each location based on the identified receptor sensitivities.

Responsibility	Action
CIMT Planning (CIMT Planning – Environment Unit) (SMP Lead/Manager, SMP Coordinator, Standby Contractor, SMP Manager)	If response phase data acquisition is required, stand up the contractor SMP teams for data acquisition and instruct them to standby awaiting further details for mobilisation from the CIMT.
CIMT Planning (CIMT Planning – Environment Unit) (SMP Lead/Manager, SMP Coordinator, SMP Standby Contractor, SMP Manager)	SMP contractor, SMP standby contractor to prepare the Field Implementation Plan. Prepare and obtain sign-off of the Response Phase SMP work plan and Field Implementation Plan. Update the IAP.
CIMT Planning (CIMT Planning – Environment Unit) (SMP Lead/Manager, SMP Coordinator, SMP Standby Contractor, SMP Manager)	Liaise with CIMT Logistics, and determine the status and availability of aircraft, vessels and road transportation available to transport survey personnel and equipment to point of departure. Engage with SMP Standby Contractor SMP Manager and CIMT Logistics to establish mobilisation plan, secure logistics resources and establish ongoing logistical support operations, including: <ul style="list-style-type: none"> • vessels, vehicles and other logistics resources • vessel fit-out specifications (as detailed in the SMP Operational Plan) • equipment storage and pick-up locations • personnel pick-up/airport departure locations • ports of departure • land based operational centres and forward operations bases accommodation and food requirements.
CIMT Planning (CIMT Planning – Environment Unit) (SMP Lead/Manager, SMP Coordinator, SMP Standby Contractor, SMP Manager)	Confirm communications procedures between Woodside SMP team, SMP Standby Contractor, SMP Manager, SMP Team Leads and Operations Coordinator (CIMT).
Mobilisation	
CIMT Logistics	Engage vessels and vehicles and arrange fitting out as specified by the mobilisation Plan Confirm vessel departure windows and communicate with the SMP Contractor, SMP Duty Manager. Agree SMP mobilisation timeline and induction procedures with the Operations Coordinator (CIMT).
CIMT Logistics	Coordinate with SMP Standby Contractor, SMP Duty Manager to mobilise teams and equipment according to the logistics plan and Sector induction procedures.
SMP Survey Team Leads	SMP Survey Team Leader(s) coordinate on-ground/on-vessel mobilisations and support services with the Operations Coordinator (CIMT).

6.7.4 ALARP and Acceptability summary

ALARP and Acceptability Summary		
Scientific Monitoring		
ALARP Summary	X	All known reasonably practicable control measures have been adopted
	X	No additional, alternative and improved control measures would provide further benefit
		No reasonably practical additional, alternative, and/or improved control measure exists
	<p>The resulting scientific monitoring capability has been assessed against the combined credible spill scenarios for Scarborough Seabed Intervention and Trunkline Installation activity. The range of strategies provide an ongoing approach to monitoring operations to assess and evaluate the scale and extent of impacts.</p> <p>All known reasonably practicable control measures have been adopted with the cost and organisational complexity of these options determined to be Moderate and the overall delivery effectiveness considered Medium. The SMP's main objectives can be met, with the addition of one alternative control measures to provide further benefit.</p>
